In 1931 the association formed by manufacturers of chemical fertilizers, maintained a high rate of curtailment of production in order to minimize the loss resulted from the general alarming situation on industries, especially on agriculture, but the dumping of sulphate of ammonia by British and German manufacturers swept the fertilizer market and the prices of bean cake, fish guano, sulphate of ammonia, superphosphate of lime, mixed fertilizers, cyanamide, etc., slumped to destructive levels. The domestic manufacturers did everything possible in their powers to stop importations. They proposed the raising of the rate of import duty, the passing law, the establishment of a system of special permits for import and export, and so on, but practically in vain. The price of sulphate of ammonia declined to as low as ¥60 per ton. The situation was very serious, and at last, in November, a special permit system was put into effect through a Departmental ordinance. A ministerial change took place during December and the Seiyukai Party came into power. The Government at once re-imposed the embargo on gold, exports and the stock market immediately became active, and industries, including the fertilizer industry, followed suit.

The problem of food in Japan is a serious one. The Japanese population is increasing yearly by about a million, but the amount of food produced in the country is not enough to feed them. Besides, the arable land in the country is so small and limited that hardly any space is left to effect any further increase, and the only method left, beyond extending abroad, is to increase the yield of crops through intensive farming. For this fertilizers are necessary and the demand has steadily been increasing. The consumption of fertilizers during 1930 was valued at ¥526,685,000, of which ¥282,470,000 were self-supplied fertilizers, while ¥244,215,000's worth were bought in the market.

General Condition of the Industry

Of all the chemical fertilizers, superphosphate of lime and sulphate of ammonia are the two representative ones, and because of the largeness of their demand and supply the market trend of these two is practically the market trend of the rest.

Superphosphate of Lime The principal raw material for the manufacture of superphosphate of lime is phosphate rock. During 1930 some 570,000 tons were imported, while some 63,385 tons were produced at home, and during 1933 and 1934 imports were 698,234 and 671,533 tons respectively. This rock is imported from U. S. A., Egypt, and the South Sea Islands.

Superphosphate production has been gaining steadily and last year its production is estimated at 1,125,000 tons. Production during the past few years is reported by the Ministry of Commerce and Industry as follows :

PRODUCTION OF SUPERPHOSPHATES
(In metric tons)

1929	408,971
1930	424,484
1931	888,887
1932	1,037,780
1933	1,127,977
1834 (estimate)	1,125,000

The superphosphate market was depressed throughout the year due to rural depression, higher prices of raw materials, and constant disputes between the Union of Superphosphate Distributors and its outsiders.

Digitized by Google

Low exchange and conclusion of the International Phosphate Agreement last year together acted to pull up prices of phosphate rocks and finished products. Domestic production capacity is rated at about 1,955,000 tons a year about 45 per cent. of which is, however, curtailed. Production in recent years runs between 1,120,000 and 1,230,000 tons.

Fluctuations in the market price of superphosphate during 1933 and 1934 were as follows:

PRICE OF SUPERPHOSPHATE, 1933, 1934

(The price is per bag of 7.5 kan.)

	1933		1934

December	1.13	1.13	1.12	1.11

Sulphate of Ammonia The demand for sulphate of ammonia has steadily increased for years. Consumption in 1930 was 488,000 tons, in 1931 it showed a remarkable increase to 618,000 tons. Imports in 1930 were 302,905 tons (value ¥29,612,000), in 1931 they decreased to 224,148 tons and in 1932 a decrease to 119,000 tons was witnessed, value being ¥15,861,000 and ¥7,035,000 respectively. The decrease in imports was made good by the increase in domestic production, which in 1931 was 393,237 tons, while in 1932 it increased to 604,235 tons, to 719,000 tons in 1933 and to 735,000 tons in 1934. Japan, in this manner, has become self-supporting in sulphate of ammonia, and has become very uneasy regarding overproduction in the future.

In Europe and America, the International Nitrogen Conference failed to relieve various countries from the pressure of overproduction, and these countries, in 1931, tried to dump their stocks in the Orient, especially in Japan, thereby causing the price of sulphate to sharply decline.

Ammonium sulphate production has been rising remarkably in the past several years, especially since the fall of the yen made competition by foreign fertilizers more difficult. Last year output rose to 735,000 tons. In 1932 it had registered the biggest advance in its history, jumping from the 393,237 tons of 1931 to 604,235. Last year showed a total more than nine times as great as that of 1920. Figures follow:

AMMONIUM SULPHATE PRODUCTION

(In tons)

1920	80,100
1925	131,138
1926	147,000
1927	176,475
1928	232,425
1929	234,609
1930	265,826
1931	393,237
1932	604,235
1933	713,550
1934	735,000

The following table shows producers of sulphate of ammonia with their capacities of production:

PRODUCTION CAPACITY OF AMMONIUM SULPHATE IN 1935

(in tons)

Companies	Present capacity	Capacity to be increased in 1935	Total production capacity
Nippon Chisso	11,000	—	110,000

Grand total	1,168,400	457,500	1,625,800

The gains made by ammonium sulphate are due to the fact that it has gained the reputation as the fastest working fertilizer sold here, since it is quickly absorbed into the soil of both paddy and upland fields and is effective for all kinds of cereals and vegetables except legumes. Since the World War it has been encroaching upon the field of bean cake, also a nitrate fertilizer. Foreign ammonium sulphate dominated the market until a few years ago and the domestic industry hardly got going. The lower yen aided it and this year's output is expected to be well above 1,100,000 tons. In spite of the fact that all domestic fertilizer companies have been operating at capacity in ammonium sulphate, Japan expects to have a deficit of 120,000 to 130,000 tons for the 1934 fertilizing year (August, 1934, to July, 1935), according to the Ministry of Commerce and Industry. Supply and demand figures follow :

AMMONIUM SULPHATE DEMAND AND SUPPLY

* 27 bags of the domestic product constitute a ton.

Cyanamide While cyanamide was a fertilizer difficult to make farmers use it, they now recognize the merit of this nitrogenous fertilizer, and owing perhaps to its reasonableness in price, its consumption increased with a great stride. In 1931 its consumption was 168,448 tons, in 1932 180,583 tons, and in 1933 223,409 tons. Production increased rapidly too. While, in 1924, it barely amounted to about 30,000 tons, it increased up to 278,825 tons in 1933, almost ten times as large. The following table shows this :

PRODUCTION OF CYANAMIDE

(Unit in metric ton and in yen)

Year	Quantity	Value
1924	29,961	4,510,707
1925	49,662	8,133,625
1926	97,107	8,353,940
1927	64,981	6,146,775
1928	65,190	6,311,975
1929	211,593	17,355,508
1930	205,572	16,649,704
1931	195,018	9,747,662
1932	283,386	16,700,175
1933	278,825	19,984,167

Digitized by Google

Sales are made through the joint sales association. Through the control of this association, and also with the increased demand, the cyanamide market in 1934 was kept firm. From August the article was sold out at a reduced price, since with that month the new fertilizer season of 1934-1935 began. The average monthly price of cyanamide in 1934 follows :

PRICE OF CYANAMIDE, 1934

(20% ingredient 6 kwan net per bag)

Jan.	¥1.75	May	¥1.83	Sept.	¥1.65
Feb.	1.80	June	1.80	Oct.	1.67
Mar.	1.80	July	1.80	Nov.	1.65
Apr.	1.82	Aug.	1.65	Dec.	1.67

Vegetable Fertilizers Vegetable fertilizers are many in kind. Bean cake, rape-seed cake, cotton-seed cake, rice bran, etc., come into this class of fertilizers, bean cake being the most important. Supplies and consumption for 1933 were :

SUPPLY AND DEMAND OF VEGETABLE FERTILIZERS, 1933

(In ton)

	Production at home	Imports	Exports	Consumption
Bean cake	244,768	530,953	2,819	770,029
Rape-seed cake	74,100	43,294	—	78,800
Cotton-seed cake	28,500	64,649	—	67,900

The domestic production of bean cake is very small when compared with the quantity imported, the greater part of which comes from Manchoukuo. In 1912 the consumption of bean cake, rape-seed cake, and cotton-seed cake was 34,640 tons, which, by 1921, increased to over a million tons, but since then no increase can be noted as the development of the synthetic nitrogen industry has cut deeply into the development of vegetable fertilizer industry.

A piece of a bean cake weighs 46 kin, or 7.4 kan. The average price of one piece was as high as ¥2.29 in 1926, whereas in 1933, the highest price was ¥1.18 and the lowest ¥0.95, a demonstration of the depressed state of the fertilizer market.

Owing to great bumper crops of soy beans in Manchoukuo in 1933, their production being estimated at 4,600,000 tons, an increase of 900,000 tons over 1932, sales of soy bean cakes revived to a great extent in 1934, and the market was firm, though in the latter part of the year demand contracted owing to crop failures in Japan. In spite of that import amounted to 6,795,000 pieces, a gain of 1,324,000 pieces over 1933. Market prices for 1934 follow :

MARKET PRICES OF BEAN CAKES IN 1934

(in yen)

December	3.58	3.70	3.62

Fish and Animal Fertilizers In Japan fish is indispensable as food, but at the same time they are caught for oil extraction and the refuse is converted into manure. The consumption of fish and animal fertilizers is as shown in the tables attached at the end of this article.

Digitized by Google

In addition to chemical, vegetable and animal fertilizers, a great quantity of self-supplied fertilizers are supplied and consumed, the figures for which are given also in statistics attached at the end of this subject.

1934 Fertilizer Industry

Trend in General 1933 rice bumper crops increased purchasing power of farmers in general, which was reflected in good sales of fertilizers in the earlier part of the year, and the industry was active. However, the yield of agricultural crops in 1934 proved to be extremely poor, and the sales of fertilizers in the latter part of the year was not as good as expected.

According to statistics of Finance Ministry, imports of principal fertilizers in 1934 are as given below, which show an increase both in quantity and value. Organic fertilizers, consumption of which once showed a decreasing tendency, indicated a gain, this being especially the case with bean cakes, which attracted attention. This was due, however, to a great yield of soy beans in Manchoukuo in 1933.

IMPORT OF PRINCIPAL FERTILIZERS
(in kin)

	1933	1934	Increase in 1934
Sulphate of potash	390,000	815,000	425,000
Nitrate of soda	582,000	663,000	81,000
Bone meal	402,000	476,000	74,000
Bean cakes	8,993,000	10,767,000	1,774,000

As to the amount of production in 1934 it is not available yet, but the Ministry of Commerce and Industry gives a tentative report on the production of the three principal chemical fertilizers as follows:

Superphosphate of lime	1,073,619 tons
Sulphate of ammonium	802,205 „
Cyanamide	139,662 „

Statistics

Production, imports, exports, and consumption of various kinds of fertilizers are to be found in the following tables:

THE VALUE OF FERTILIZERS PRODUCED IN JAPAN PROPER 1929-1933
(Unit ¥1,000)

Year	Fertilizers which requires a licence for production					Fertilizer not requiring any licence for production	Total

Cement

History

In 1871, cement works were established by the Government in Fukagawa District in Tokyo. This was the origin of the cement industry in Japan. For ten years the works gradually expanded so that by 1891, the total capital invested in the industry was ¥1,000,000, the works numbered ten and the capacity was about 300,000 barrels a year.

In 1898, there were sixteen works with an aggregate capacity of 1,000,000 bbls, and imports were entirely excluded. In 1912, there were nineteen companies and twenty three miles. The total capital invested amounted to ¥18,000,000 while the capacity had increased to 4,000,000 bbls.

During the World War, the industry enjoyed unprecedented prosperity and expanded rapidly. New companies were formed and new mills added. At the end of 1926, companies numbered twenty-one with thirty four mills, the total authorized capital was ¥118,000,000 of which ¥85,000,000 was paid up, and the total production capacity had increased to 17,500,000 bbls.

During the last twenty years, demand for cement increased every year with five exceptions, there was a 2% decrease in 1912 and a 10% in 1915 and 1919. The average rate of increase was about 11%. But in 1930, domestic consumption suddenly decreased by 12%, the first time that any such sharp decrease had ever been experienced. The decrease was due to the general depression and the economic retrenchment policy of the Government following the removal of the gold embargo in January, 1930. In 1931, there was a further decrease, but in 1932, with general activity in industry being felt, there was some recovery over the previous two years.

TABLE SHOWING GROWTH OF CONSUMPTION OF CEMENT

(— shows decrease)

Year	Domestic consumption bbls	Percentage of increase or decrease
1912	3,253,495	— 2%
1913	3,530,084	9
1914	3,596,526	2
1915	3,234,644	— 10

The Industry in Recent Years

For some years in the past, the interest of cement industry in Japan centred on the question of the adjustment of over-extended capacity of production. The result is a large curtailment of production.

In 1925 capacity was about 50 per cent. larger than the output, which became almost 100 per cent. in 1934. In recent years the greatest consumption of cement, including domestic consumption and export, was 480,000 tons of May, 1934, while the production capacity at the end of November of the same year was 1,020,000 tons a month. For almost a year 57 per cent. of the Cement Association's (Cement Rengokai) capacity has been curtailed.

The cause of this abnormal condition of the industry is found in the fact that in fixing production curtailment ratio of the member companies of the Rengokai, it has been based on the capacities of production of the members. This led the member companies to expand capacities to get larger shares of business. The situation culminated in the latter part of 1934 in forcing the Department of Commerce and Industry to apply the Major Industries Control Law to the cement industry.

Statistics Statistics for the capacity of production, actual production, output of cement classified by uses and export of the same classified by destinations follow:

PRODUCTION CAPACITY AND ACTUAL PRODUCTION OF CEMENT
(in 1,000 metric tons)

Year	Production capacity at the end of Nov.	Actual production in the year
1925	3,294	2,508
1926	3,549	3,206

1934 Cement Industry

Demand and Supply Conditions The industry was very prosperous in 1934 following close to the unprecedented boom in the previous year. Causes of prosperity of 1933 were found in the farm relief work and industrial activities caused by inflation policy of the Government. The relief works were continued throughout 1934, and various industries were active, so that the consumption of cement was good too. The damage done to Kwansai districts by the typhoon in the fall created a new demand for cement, by which the industry made an unexpected profit. At the Special Session of the Diet a budget calling for ¥66,000,000 for 1935 and ¥70,000,000 as supplementary budget for 1934 were appropriated for reconstruction works in Kwansai districts. Since the major parts of reconstruction expenses would be consumed by construction works of harbours and buildings, the industry would no doubt further profit thereby.

The output for domestic consumption in 1934 was 3,887,000 tons which showed a decrease of about 90,000 tons as compared with the output of 3,977,000 tons for 1933. But this does not mean a decrease in consumption. New outsiders of the cartel, which came to market their product, viz.: Nitto, Hinode, Kyushu Industrial, and Taihei Companies put up about 30,000 tons a month, which reduced the output of member companies of the Rengokai.

Export to Manchoukuo totalled 437,000 tons, showing a surprising gain of 40 per cent. over 313,000 tons of 1933. The increase of demand in that country may be due to industrial developement there and also to some military reason. But, as explained later in this article, the country is going to become self-supplying with regard to supply of cement, perhaps from the middle of 1935, and the export in the year 1934 may be taken to have reached its peak.

Exports to countries other than Manchoukuo were not so good, owing to the inactivities of the Japan Cement Export Guild. Exports totalled about 320,000 tons and showed a decrease of about 70,000 tons as compared with 1933. This must be partly attributed to the fact that foreign countries tried to restrict our exports.

DEMAND AND SUPPLY OF CEMENT IN 1934 BY MONTH

(In tons)

	Production	Domestic market	Export to Manchoukuo	Export to other countries	Stock in warehouse

RATE OF CURTAILMENT OF PRODUCTION
(in %)

Month	1933	1934
January	55	52
February	55	52
March	50	52
April	50	52
May	40	52
June	50	52
July	50	57
August	50	57
September	44	57
October	50	57
November	50	57
December	52	57

The Industry Under Major Industries Control Law Examinations of conditions of increase of monthly production capacities of companies which belong to the Cement Rengokai reveal that capacity of 551,000 tons at the end of June, 1932, increased to 638,000 tons and to 791,000 tons in the corresponding periods of 1933 and 1934 respectively, and the actual production was curtailed up to 57 per cent.

The Department of Commerce and Industry became keenly conscious as to future predicaments which might be brought in by such over-expanded capacities. As the Department found it difficult to make members of the Rengokai and the outsiders stop expansion of capacity on their own accord, it finally resorted to the application of the Major Industries Control Law to stop increase of capacity for a year, to make the outsiders join the Rengokai, and to reduce the price of cement and the law became effective on November 29, 1934.

Formation of New Rengokai As the term of the old Rengokai expired in November, 1934, the New Rengokai was formed to succeed the old one, the term of which will run to November, 1944. The New Rengokai will be invested with authority to control both production and sales of the member companies starting from March 1, 1935. It was also agreed that in order to measure the actual output more correctly it would make restrictions on production based on quantity instead of on time.

Though Onoda, Oita and Denki Kagaku Co., Ltd. did not join the New Rengokai, four of Hinode, Nitto, Kyushu Industrial, and the Dai Nippon Artificial Fertilizer Co., Ltd. which used to be outsiders, joined the Rengokai, so that its members now number seventeen.

Manchurian Market Export of cement to Manchoukuo in 1934 was 437,000 tons and showed a gain of 124,000 tons over that of 1933. Though the demand in that country may no doubt increase hereafter, the country is becoming fast self-sufficient as regards the supply of cement. Out of 174,500 tons of cement which was required by the South Manchuria Railway Co., Ltd. more than one half of the quantity was sold by Manchurian Cement, Daido Cement, Fushun Cement, Harbin Cement, Anshan Cement Co., which shows the rapid development of the cement industry in the country. In addition to the above, mills established by Onoda Co., Ltd. in colonies will put up their products to the country, and the cement manufacturers of Japan proper will lose the market by so much.

Market in General The cement market was firm for the first half of the year. Toward the close of the year, however, it showed weakness owing to the Government's suggestion to cut price and also to the tender invited by the Department of Railways in which the Onoda group was successful in offering lower price. The trend of the market follows :

Ceramics

Introduction

Pottery making has an old history in Japan. As far back as can be traced in history some potters appear to have had their secret proprietary methods of production. In the Meiji Era, especially after the Russo-Japanese War, along with the advance in industry in general, pottery making was industrialized, a procedure which was thought difficult of accomplishment, and to-day annual production amounts to from ¥60,000,000 to ¥80,000,000 in value, while exports amount to over ¥30,000,000. It is now one of the principal industries in Japan.

The chief places of production are Nagoya and Seto, both in Aichi prefecture, and the eastern part of Gifu prefecture. The quantity produced in these places amounts to about 70% of the country's total production. Seto is such a famous place for pottery that the Japanese commonly call chinaware "Seto-mono." Besides the products named above "Kutani" ware of Ishikawa prefecture, "Shimizu" ware of Kyoto prefecture, and "Arita" ware of Saga prefecture, are all famous though produced in small quantities only. Nagoya district is one of the largest pottery producing places in the world.

History

Pottery was being made, crudely admittedly, at the time of the Emperor Jimmu, the first Emperor of Japan, who lived about 650 B. C. At the time of the Emperor Suinin, that is, 66 A. D., a Korean prince was nationalized, and one of his retainers, who knew the potter's art, was able to give instruction on foreign manufacturing methods. Later, at the time of the Emperor Kammu, i. e., 781 A. D., pottery was imported from China, and the art made further progress.

In 1221 A. D., a man named Kagemasa Kato studied the art of pottery making in China. When he returned, he settled in Seto village, Aichi prefecture, and made chinaware of superior quality, the origin of the present "Seto" ware.

After that, many master artisans arose and tea-things, rice bowls, pitchers, incense burners, etc., now of great rarity and value were produced.

Present Condition of the Industry

Up to 1929, the chinaware industry enjoyed great prosperity. In 1928, total production amounted to

Digitized by Google

¥76,726,018, while there were as many as 6,862 factories and 47,108 employees. In 1929, production decreased by about ¥2,000,000's worth owing to a shrinkage in demand, though exports in that year were the greatest the country ever made. In 1930, owing to the raising of the embargo on gold, overproduction the world over, the panic in America, shrinkage in purchasing power in importing countries, the slump in the price of silver, increases in tariffs, and lowering of the price level in general, exports declined by about ¥10,000,000 and in 1931 by a further ¥8,000,000, while 1932 showed a slight increase of about ¥3,500,000. The reimposition of gold embargo and consequent lowering in exchange stimulated exports, which increased to ¥35,634,000 in 1933 and to ¥41,877,441 in 1934 respectively in spite of restrictions of import by many countries in Europe, British India, Dutch East Indies, etc.

Production

The following table shows how this industry has developed recently.

PRODUCTION OF POTTERY

Year	Exports yen	Domestic consumption yen	Total amount yen	Index number
1907	5,257,832	7,099,845	12,357,677	76

Exports of Chinaware

Though exports of chinaware amounting to ¥1,300,000 were made as early as 1886, the export business did not develop to any great extent until the Russo-Japanese War. In 1904, the Nippon Toki Kaisha, Ltd., was organized, to be quickly followed by the Toyo Toki Kaisha, Ltd., and the Nagoya Seito-sho. Each of these companies established large mills with up-to-date equipment and began to produce chinaware on a big scale. Painstaking studies were made to improve the products and build up an export business, and these, together with other special reasons, account for the remarkably large increase in exports. The special reasons are:

(1) Japan is able to produce specially thin chinaware that other countries cannot.

(2) Japanese artisans are especially clever at their work.

(3) The cost of production is reasonable.

Just at the time when the industry was organized on a modern basis, the World War broke out. Pottery works in belligerent countries in Europe were closed down and exports from Japan increased by leaps and bounds. A temporary set-back was experienced when the War ceased, but a recovery was soon made and there was a steady growth until 1929, then there was a falling off until 1932, when some slight gain was made over the previous year.

EXPORTS OF CHINAWARE TO DIFFERENT COUNTRIES

(in ¥ 1,000)

Countries	1914	1929	1930	1931	1932	1933	1934

Domestic Consumption

There are no statistics to rely upon for the exact amount of domestic consumption, but if we subtract exports from the total production we have an approximate value. Figures shown in the second column of the first table "Production of Pottery" give some idea of the amount. Though tile making is growing fast on account of the increase in building of Western style houses, the market was depressed because of lack of

Digitized by Google

control over production and sales.

The peculiarity about chinaware intended for domestic use is that it must be made by small factories on the family basis. The reason is that the taste of the Japanese for chinaware are very varied, differing according to each individual as to the form, colour, design, etc., and making it impossible to produce on large scale mass production principles.

Glass and Glass Manufactures

Origin and Development

As far as historical record shows, the art of glass manufacturing was developed in the Nara period, that is about 700 A.D. Later, technics of manufacturing were imported both from the South Sea Islands and China, and put into practice in Osaka, Kyoto and Tokyo, where the industry developed. After the Meiji Restoration, the Government established a model factory to encourage the development of the industry and various attempts were afterwards made to make glass and glassware both by the Government and by individual concerns, but it was not until after the Russo-Japanese War of 1904-1905, that the industry made any great progress.

Present Condition

Due to the strenuous efforts of manufacturers and advantages from a low exchange rate since the gold embargo was replaced, the glass industry in Japan is doing remarkably well. Imports have gained but little during the past six years. They were worth ¥8,860,552 in 1926, ¥9,075,651 in 1933, and ¥4,607,129 in 1934 not counting photographic plates in any year.

On the other hand, the exportation of Japanese glass products, stimulated by exchange relations, has been exceptionally active since the last gold embargo was clamped. Exports in 1932 came to ¥9,281,682, in 1933 to ¥15,326,611, and in 1934 to ¥19,454,333. Glass products from this country are shipped to almost all parts of the world.

A strong point for Japanese glass exports is that Japanese manufacturers and traders are able to reduce their export prices by 30 per cent., since the present prices are 30 per cent. higher than usual. Exporters are wisely leaving room for competition with foreign products, even though tariff rates are raised by foreign countries. Still, the present prices of Japanese products are low and for this reason, they are in heavy demand abroad.

Glass Tableware Glass tableware was early manufactured in Kagoshima and the old province of Satsuma in Kyushu Island. After the Meiji Restoration it was manufactured by the Shinagawa Shoshi Seizosho (Shinagawa Glass Co.) which was under Government control. At present it is manufactured by the Fukushima Glass Co. organized in 1896, Koidé Shoshi Seizosho (Koidé Glass Co.) established in 1898, Marusa Glass Co., organized in 1918, and the Kawai Shoshi Shokki Seizosho (Kawai Table Glassware Co.) organized in 1920, etc. Production by these and other manufacturers is given below.

Other Glass Articles Glass articles for scientific and medical purposes were manufactured as early as 1850. There are many manufacturers of these articles in Tokyo district.

The manufacturing of eye-glasses was first practised as early as 1600. In 1873, a certain Mr. Matsugoro

Digitized by Google

Asakura from Tokyo, went to Austria and learned the art of manufacturing eye-glasses on modern principles. His son and several others are now manufacturing them.

Red glass was manufactured by the Kagoshima clan prior to the Meiji Restoration, and later by the Shinagawa Shoshi Seizosho, which was under Government control. Also a certain Mr. Tokijiro Iwashiro succeeded in manufacturing lenses for the use of search-lights, and lighthouses. The right of manufacturing these lenses was later transferred to the Nippon Kogaku Kogyo Kaisha, Ltd., (The Nippon Optical Science Industrial Co., Ltd.). Mr. Iwashiro's son later succeeded in manufacturing cut glass.

Glasses for optical work were mostly imported from Germany before the World War, but when the supply was cut off by the war, it was determined that "lenses for optical science must be produced at home at any cost." The Nippon Kogaku Kogyo Kaisha, Ltd., to which all the results of studies made by the naval arsenal were transferred in 1914, and the Osaka Industrial Research Institute, which started research work in 1921, continued investigations. The Osaka Institute succeeded in 1925 in discovering a formula for manufacturing lenses, superior to German makes at reasonable cost. The Nippon Kogaku Kogyo Kaisha, Ltd., also succeeded in finding a way to make these lenses, and it is probable that the importation of lenses of these classes from Germany will, in a not distant future, become unnecessary.

Glasses for the chemical industry, that is, hard glasses, are manufactured in several mills in Japan. High grade hard glass which is not in any degree inferior to the best imported is now manufactured by several firms for thermometers, gauges and the chemical industry.

Sheet Glass

Though many efforts were previously made to manufacture sheet glass, it was not until 1904 that a Mr. Magoichi Shimoda, after two years of experimental manufacture, was successful in producing a product that could be put on the market.

In 1907, the Asahi Glass Co., Ltd., was organized in Amagasaki, Hyogo prefecture, by the family of the late Baron Yanosuké Iwasaki. An expert and five skilled workmen were brought over from Belgium and commenced to manufacture from 1909. The company struggled for 7 years against difficulties in technique and pressure of foreign competition, and in the end succeeded in producing about 120,000 cases a year. In 1914, a patent, which enabled the company to produce sheet glass by a mechanical process was bought from the American Window Glass Co., Ltd., and a factory was established at Makiyama in Tobata, Fukuoka prefecture. On account of the cutting off of imports from Europe during the World War, the company not only increased production, but exported their products to places far afield as South Africa and London. In 1916, the company established a factory in Tsurumi, Yokohama, and in 1917 another in Yawata, Fukuoka prefecture. In 1923 and 1924, the factories in Makiyama and Tsurumi were extended, and at present the company is able to produce as much as 330,000,000 sq. feet.

The Nichi-Bei (Japan-American) Sheet Glass Co., Ltd., was organized in 1917 and was the first to use the sheet process in Japan. The Shoko Glass Co., Ltd., was organized in 1925 under the joint management of the Asahi Glass Co., Ltd., and the South Manchuria Railway Co., Ltd.

Digitized by Google

The company is manufacturing glass under licence from the Asahi Glass Co., Ltd., by the method employed by the latter. At present the above mentioned three companies only are manufacturing sheet glasses. Their capital, capacity, etc., are as follows :

Companies	Head office	Authorized capital	Paid-up capital	Capacity	Factories
		yen	yen	cases	
Asahi Glass Co., Ltd.	Tokyo	20,000,000	20,000,000	3,300,000	Tsurumi, Makiyama, Amagasaki

Lacquer-ware

Historical and General

Industry Inherent The Japanese are a people skilled in handiwork. Prior to the introduction of modern productive industries from the West in the early years of Meiji, the Japanese were separated from Occidental civilization and culture and the various handicraft industries that had come down from ancient times were in a flourishing condition

Digitized by Google

and in a state of development peculiar to the country. The industries especially referred to are the silk, porcelain, earthen-ware, lacquer-ware, cloisonné-ware, gold lacquer-ware and the metal engraving.

The lacquer-ware industry existed in ancient times. As was the case with the ceramic industry, it progressed with the introduction of Buddhism and of advanced methods from China, but did not make so notable a development as in the case of the textile, ceramic or other industries. With the rise to favour of the tea ceremony in the Ashikaga Period, Kyoto monopolized the production of lacquer-ware, although wares of nearly the same kind, such as "Wajimanuri" and "Shunkeinuri" were produced in fairly large quantities in different places and were largely used for table-ware. After the Restoration of Meiji there was a considerable decline in the demand for such wares as "Noshironuri," "Wakanuri" and "Tsugarunuri" which had been popular in the Tokugawa Period, while the output of "Wajimanuri," "Kurodenuri," and "Imazunuri" which had principally been used as table-ware greatly increased as they were being exported in increasingly large quantities.

Urushi Obtainable Only in the Orient Japan is the only country in the world enjoying world-wide renown in the technical art of lacquer-ware manufacture. The various industrial arts of Japan such as the porcelanic and weaving owe their origin to China or Western countries, but as regards lacquer, Japan acknowledges no teacher; from remote antiquity, especially in the technique of relief lacquer the art has developed without aid from any foreign methods of manufacture or materials. For more than two thousand years the craftsmen of Japan, having striven to improve, finally attained a degree of wonderful skill. The production of lacquer-ware is confined to Oriental countries where only lacquer juice, known as urushi, is obtainable—Japan, China, Korea and India,—although there is an evident tendency in Western countries in recent years to manufacture lacquer-ware of industrial art value. The application of mother of pearl, known as nacre work, became common during the Nara Period. A large number of ancient examples of lacquer-ware that have served as models for succeeding generations are still kept in the Shosoin, the Imperial Treasure House in Nara. These represent products of the Tempyo Age, when even large wooden buildings were lacquered. Among such buildings left standing are the Chuson Temple in Iwaté prefecture and the Byodoin Temple in Kyoto prefecture. Embossed lacquer-ware was invented during the Kamakura Period, when tasteful designs of chrysanthemums and other flowers were in vogue.

From Toyotomi Downward A golden mother of pearl inkstone case in embossed lacquer with a chrysanthemum design is now treasured in the Hachiman Shrine at Kamakura. The pomp and glory of the third Ashikaga Shogun stimulated the art and resulted in the perfecting of embossed lacquer work and the extension of its application to articles of daily necessity. Hideyoshi Toyotomi accomplished his gigantic task of pacifying the country. Grandeur was a unique feature of his administrative policy and social and other life in those days. The grand Momoyama style was reflected on the industrial arts. Koetsu relief lacquer was supreme and Kodaiji relief lacquer was also produced, representative lacquer products of those days. When the third Tokugawa Shogun, Iyémitsu, came into power,

Digitized by Google

he erected the great Nikko mausoleum and Zojoji Temple at Shiba, Tokyo for his grandfather and father respectively, and lacquer was amply applied to these buildings. During the reign of the fifth Shogun, Tsunayoshi, an exquisite technique attained its zenith, defying all the imitative powers of succeeding generations. It was applied to scabbards of swords, miniature medicine-cases (known as inro) and various articles used by the Daimyo. Notable lacquerers such as Koami Choju, Koma Ikyu, Ogata Korin and others flourished during this period. Since that time the production of lacquer has spread to various localities throughout the country, and unique local colour has been freely introduced into the design. Competition ensued as in all industrial articles, and some of the products of those days were exported abroad. Japanese industrial arts were almost wholly neglected during several years following the Meiji Restoration. Lacquered articles of artistic value were sold at ridiculously low prices and these were purchased by foreigners who had eyes for their value and who took them to their own countries. This provided an opportunity to introduce the Japanese lacquer art to foreign countries, but at the same time Japan lost many articles of both æsthetic and monetary value.

Its Fine Quality A French steamer was wrecked off Izu while outward bound from Japan laden with Japanese lacquer-ware that was to be exhibited at the Vienna International Exposition in 1873. The cargo was salved 18 months after the accident and the lacquer goods were found to be undamaged. On slight polishing they regained their former lustre and thus displayed the intrinsic value of this national art product. When the news of this salving and condition of the goods became known abroad the export trade took a sudden spurt forward, but there were traders who exported goods of poor quality, and did great damage to the credit and value of Japanese products in the eyes of foreign customers. Apart from defects in manufacture, some of the bad reputation which exported Japanese lacquered-ware has gained, is ascribed to the fact that some manufacturers are producing inferior articles on account of having been forced by exporters to lower prices, but of late years efforts have been made by the authorities concerned to remedy these evils.

The Output

The annual production of lacquered articles is valued at more than ¥30,000,000, and the annual export value is about ¥2,000,000. The United States is the largest consuming country, and next comes Great Britain, with other countries far behind. Total exports stood at ¥90,000 in 1872, ¥630,000 in 1887, ¥890,000 in 1902, ¥1,140,000 in 1912, ¥1,340,000 in 1922, ¥1,780,000 in 1925, ¥1,490,000 in 1927 and since then the amount has been increasing yearly, the average annual export value for these several years being about ¥2,000,000. Kyoto, Aichi and Ishikawa prefectures are the largest producing centres in Japan.

How the Ware is Made

Lacquer Juice Lacquer juice forms the main material of the craftsmen. It is obtained from the lacquer (urushi) tree grown in Oriental countries and is a milky juice with a greyish-white colour. In air it undergoes an oxidizing process, becomes brown and finally solidifies. When solidified, it is not soluble in ordinary solvents and has an unusual resistance to acids. Its beautiful appearance and smooth feel defy

Digitized by Google

paint and varnish. Lacquer juice is regarded as a botanical excrete and in normal conditions is stored in a fixed position in the tree. The tree is tapped by making a horizontal, slanting or V-shaped incision of 10 centimetres right to the sap, and from this the greyish-white juice oozes. Attempts have been made to obtain the juice by means of pressing the bark and leaves of the tree, or by using alcohol, but without success. The greyish-white product is called raw lacquer and is used for the initial application to the goods to be lacquered. As material for the finishing applications and colour lacquering the water is extracted from the juice, and various refining processes follow according to the result required. The chief ingredients of raw lacquer are Urshiol, 77.63%, gummy substance, 2.62%, carbonic substance 1.94% and water 17.81%.

Manufacturing Process Lacquer-ware manufacturing is divided into three stages, namely, the initial application, lacquering and relief lacquering. The process is further divided into different categories according to technical experience and skill. Wood, bamboo, paper, metal and porcelain are used as basic materials for initial lacquer applications. Wood is mostly used throughout the country, but wood has the drawback of swelling and contracting according to weather condition. Bamboo and paper are used for particular lacquer-ware making, while metal and porcelain are less commonly used. The initial application is made on the surface of the ware by means of a spatula or brush, the article is thus made water-proof and the absorption of lacquer applied to finish or fill in tiny holes or other defects is prevented. The finishing process is of course for the purpose of making the ware solid and smooth.

Lacquer is the best material for the initial application, though shibu-varnishing or glue-varnishing is also practised, especially for low grade wares. The juice of the astringent persimmon is the chief substance of shibu, and with this is mixed powdered charcoal or other materials. Glue is also used as a raw material, but it is not much good for solidity. Glue-varnished wares are made mostly for export, and the bad reputation that modern Japanese lacquer-ware has in foreign markets is chiefly ascribed to these glue-varnished articles. Formalin is used to solidify these wares. As regards the finishing application, a proper amount of pigment is added to refined lacquer to make it coloured or transparent, and this is finely applied to wares that have been through the initial application. These are then kept in a wooden closet to avoid dust and allowed to dry. This is called fresh lacquering. When wares are dry, they are polished by charcoal.

Relief lacquering was evolved to give beautiful designs to wares after the finishing application had been gone through. Pictures or designs are painted on the articles by lacquer and before the lacquer is dry, gold, silver and other metallic dust or pigment is applied. Then polishing for the finishing touches takes place. This is called ordinary relief lacquering, but there are other methods of production and prices differ according to the extent of finish. Of the two principal methods of manufacturing high-class goods, polished relief lacquering is one. When the ordinary relief lacquering process is completed, lacquer is once more applied to all the surface and the whole is then polished by charcoal, and the design is pre-

Digitized by Google

sented on the flat surface. The other is embossed relief lacquering, and this requires much time and skill. Designs are made in high relief and the ordinary relief lacquer is applied. Shells, corals, jewels and stones are often inlaid in lacquer-ware and to these are applied transparent or block lacquer, the product being known as aventurine-ground lacquer-ware. Gold dust is also applied in relief and this is known as flush pointing. Another unique lacquering is the application of coloured lacquer coatings for as many as a hundred times, and when dry an exquisite design is carved on the ware. This process somewhat differs from relief lacquering but it forms one of those elaborate methods in the manufacture of the lacquer-ware which remains one of the outstanding products of the Japanese craftsman.

Production and Exports

Japanese lacquer-ware produced during 1933, the latest figure available, amounted to ¥29,571,665 while exports amounted to ¥2,371,000 in 1933 and to ¥2,570,476 in 1934. Production classified according to prefectures follows :

Prefecture	Production in 1933 (In Yen)
Kyoto	8,898,600
Aichi	4,031,142
Ishikawa	2,643,087
Fukushima	2,162,026
Wakayama	2,703,375
Shizuoka	2,420,690
Fukui	1,884,537
Niigata	962,000
Toyama	1,080,127
Yamagata	752,883
Shiga	754,229
Kagawa	672,362

CHAPTER XXIII

MISCELLANEOUS INDUSTRIES (Continued)

Caustic Soda, Soda Ash, Bleaching Powder, Dyestuff, etc.

Introductory

The Japanese chemical industries involving the manufacturing of caustic soda, soda ash (sodium carbonate or washing soda) and bleaching powder owed their development to the World War, which stimulated them to sudden growth. More than 10 companies were founded during that period, but only a few of them survived the great economic slump which followed the termination of the World War. For a long time after the War, the industries were in a depressed condition. It has been no easy matter for the existing companies to have arrived at their present stage of development, many attempted but fell on the way, often, with others to be merged with stronger concerns. Those which are doing business at present are all backed by large business houses or financing organizations. Protection of the Government, which is alive to the momentous value of these industries, must not be ignored. Without Government protection and encouragement, the prosperity to which they have now attained would never have been realized. There are about nine leading industries which the Government and the various authorities concerned are making efforts to consolidate, and this is one of them. The others are the nitrogen fixation industry, the dyestuffs industry, the iron and steel manufacturing industry, the aluminium industry, the oil industry, the automobile industry, the photo-chemical industry, and the minute chemical industry.

Soda Ash Industry

The soda ash industry holds an important position in Japanese industrial circles. It is an industry inseparable from that of glass and other chemical industries that require considerable amounts of alkali. Soda ash occurs in its natural state in some parts of the world, but in this country it has to be prepared from salt, and as salt is a Government monopoly the price is high, so when the Asahi Glass Company, in order to attain self-sufficiency, started the production of soda ash after the World War it did so on an uneconomic basis, but the Government came along and by granting liberal subsidies to this and other concerns saved the industry and put it on a paying basis. Brunner, Mond and Company (British) and H. Ahrens and Company (German), who used to be the largest importers, were hit hard by this development in home production. The history of the growth of the soda ash industry in Japan is the history of strife between the Asahi Glass Company, backed by the Mitsubishi interests and protected by the Government, and these foreign concerns. The total production of soda ash in 1933 was 272,135 tons while about 45,725 tons were imported. In 1934 Japan succeeded in exporting about 15,160 tons and has become more than self-sufficient in this article.

Digitized by Google

Caustic Soda

As a by-product of the production of caustic soda the poisonous gas chlorine is freed. This gas is made into commercial bleaching powder, and in the past the commercial production of caustic soda was only possible if a good price was obtained for bleaching powder and the industry was greatly dependent on this latter commodity for quantity of production. Nowadays, as soda ash is being produced cheaply, caustic soda is being manufactured from it and domestic production is increasing. The replacement of the gold embargo and the raising of the tariff virtually sealed the activity of the British importing concern, whose pressure was a great hindrance to the development of the Japanese soda ash industry, and self-sufficiency in the production of both soda ash and caustic soda has been thereby attained. Brunner, Mond and Company has largely restricted its activities and home production has greatly increased. The Asahi Glass Company and Nippon Soda Kaisha, known as N. S. K., have recently expanded their equipment for producing soda ash to an annual productive capacity of 150,000 tons, which is about 30,000 tons more than the yearly domestic demand. The production of caustic soda in 1933 totalled 131,709 tons which showed that the increased productive equipment of N. S. K. and the Electrolytic Soda Industry Company was completed.

Bleaching Powder

The demand for bleaching powder has become active since an improvement was registered by the paper manufacturing companies, who consume 70 per cent. of the total production. The business solely depends on the rise and fall of the foreign-style paper manufacturing industry.

The Industries in 1934

Caustic Soda Along with the increase in the production of rayon, that of caustic soda also gained. Especially the increase of production by ammonium method was remarkable. The Asahi Glass Company commenced activities in 1933 and completed equipments for a production of 110 tons per day. Owing to prosperous export, equipments for production by electrolysis method were extended also. The Nippon Soda Kogyo Kaisha added a mill with a capacity of 10 tons a day; the Nippon Electrolytic Soda Industry Co. one with 24 tons; the Saito Ryuso Kaisha one with 8 tons; the Tsurumi Soda Kaisha one with 12 tons, while the Nobeoka Mill of the Asahi Bemberg Co. has become self-sufficient with regard to the supply of caustic soda, and the production of 1934 was 164,834 tons against 131,709 tons of 1933 and showed a gain of 25 per cent. On the other hand, imports in the same year totalled 16,546,000 kin and showed a decrease of 4,249,000 kin. Exports showed a sudden increase to 20,488,600 kin.

Caustic Soda Market The caustic soda market was dull owing to the dullness in rayon market throughout the year although toward the close of the year, increased production of rayon as well as demand from new mills of Fukushima, Kinkwa, Teikoku, Toyo, Nippon, and Dai Nippon Rayon Companies were enough to revive the market and enabled it close the year in a firm tone.

CAUSTIC SODA MARKET IN 1934
(unit in yen per bag of 100 kg.)

Month	Price	Month	Price
Jan.	20.50	July	17.40
Feb.	20.00	Aug.	17.00
Mar.	19.30	Sept.	16.90
Apr.	18.40	Oct.	16.30
May	18.20	Nov.	16.00
July	17.80	Dec.	16.70

Soda Ash Along with the activities in glass, soap, dye-stuff, and medicine industries this industry was active, too, its production amounting to 202,291 metric tons. Exports also totalled 15,403 tons. Market, however, was weak throughout the year, the trend of which follows :

SODA ASH MARKET IN 1934
(unit in yen per bag of 100 kg.)

Month	Price	Month	Price
Jan.	10.34	July	9.50
Feb.	10.30	Aug.	9.00
March	10.02	Sept.	8.80
Apr.	10.00	Oct.	8.50
May	9.68	Nov.	8.50
June	9.00	Dec.	8.50

Bleaching Powder This industry continued to keep up a high rate of curtailment in 1934.

MONTHLY CURTAILMENT OF PRODUCTION OF BLEACHING POWDER

Month	Curtailment in %	Month	Curtailment in %
Jan.	50	July	48
Feb.	55	Aug.	52
Mar.	55	Sept.	52
Apr.	55	Oct.	40
May	52	Nov.	40
June	48	Dec.	45

In recent years the control of cartel on the production and sales of bleaching powder has been much weakened owing to the fact that some companies are producing liquid chlorine and is selling it as such. In order, therefore, to make the control of bleaching powder effective it was agreed to extend it to the production, sales and price of liquid chlorine by the Joint Sales Association of bleaching powder. Production of bleaching powder in 1934 totalled 64,980 tons, showing a gain of 3,838 tons over 1933. Exports showed an increase, too, and amounted 4,247 metric tons.

Statistics Below are given data bearing upon the industry of these three articles :

PRODUCTION AND IMPORTS OF SODA ASH

	Production (In metric tons)	Imports

Soap Making

Development and Production

The industry was started early in the Meiji Era, but no great progress was made until after the Russo-Japanese War of 1904-1905, when machinery was introduced from abroad. During the World War, the industry enjoyed great prosperity, but the reaction was also very severe when it came in 1920. However, during those difficult times, the foundation of the industry became more consolidated and the quality of soap improved a great deal.

Production of soap in Japan is as per the accompanying table. Tokyo and Osaka are the two principal places of production, the former producing about 50% of the total production in the country, while Osaka produces about 30%. Export of soap, 90% of which is toilet soap, are made mostly from Osaka for China and Kwantung Province. Imports amount to barely ¥100,000 in value a year.

Raw Materials for Soap

Oils, tallows and alkali are used as raw materials for soap. The principal raw material, beef tallow, is imported from Australia, while tallow, copra oil, hardened fish oil, and groundnut oil, of domestic production mostly, are also used. For laundry soaps, hardened fish oils and cheap vegetable oils are used. For soap for industrial purpose, vegetable oils of superior grade are mostly in demand, and for soap for washing silk goods, puna oil is in common use. About 50,000 tons of raw materials are consumed for soap making purposes, tallow accounting for 14,000 tons, hardened fish oil 20,000 tons, copra oil 6,000 tons, while about 10,000 tons of caustic soda and considerable quantities of soda ash are used.

Methods of Production

Soap has long been produced in Japan on a household industry basis, but the methods used have been rather backward when compared with the progress made in other industries. Recently, however, a considerable amount of capital has been invested in the industry, modern machinery has been installed and well-trained personnel engaged, factors which promise further improvement. Most of the toilet soap is produced on a large scale by machinery.

To ascertain the amount invested is very difficult as the industry is still run mostly as a household industry. The principal soap manufacturers producing on a large scale are Harumoto Sekken Seizosho, Nitto Sekken Kaisha, Ltd., Nakayama Taiyodo, Velvet Soap Making Co., Ltd., Nagasé Shoten, Ltd., Marumiya Shoten, and Shiseido.

Vegetable and Animal Oils and Fats

Introduction

For lighting purposes vegetable oils have been used in Japan for centuries. In earlier days perilla oil was used but this was later replaced by rapeseed oil. The production of these oils on an industrial basis only developed after the Russo-Japanese War of 1904-1905.

The Development of Oil Industry

Production of hardened oil in Japan during 1933 amounted to 61,500 metric tons in contrast to 50,150 tons for 1932; 46,800 tons for 1931; and 42,100 tons for 1930. The increase was the result of high market price. It is used mostly for soap making, candles and dietary purposes. Even during the time when Japan was on gold, hardened oil was exported. Since the country was off gold, exports have increased. The 1934 exports were 24,104 metric tons, worth ¥5,042,254; 1933 year exports 23,421 metric tons, worth ¥4,939,000; 1931 year exports 13,044 metric tons, worth ¥2,997,000; 1930 year exports 12,326 tons, worth ¥3,987,000. Last year's exports were about 85 per cent. gain in the quantity over 1931.

The principal vegetable oils produced are soy bean and rapeseed. Linseed oil, perilla oil, hempseed oil, wood oil, sesame oil, cotton-seed oil, castor oil, groundnut oil, copra oil, camella oil etc., are also produced in considerable quantities. The production of soy bean oil in 1913 was valued at ¥1,330,000, but by 1933, this had increased to ¥13,115,000, after having touched over ¥13,900,000 in 1929; rapeseed oil was valued at ¥10,123,000 in 1933; groundnut and copra oils reached over ¥10,000,000 during the World War, but had decreased to ¥385,639 and ¥2,657,171 by 1933. On the other hand, the production of linseed oil during the World War was valued at barely ¥200,000, but this had increased to ¥3,775,357 in 1933. The production of cottonseed oil and sesame seed oil has developed steadily since the Great War, being in 1922 valued at ¥817,288 and ¥969,891, while in 1933 they were ¥2,731,458 and ¥2,662,503 respectively.

In addition to the above-mentioned vegetable oils Japan produces, in Kyushu Island, vegetable wax, but the yields of "hazé" seed, from which the wax is produced, has been yearly decreasing and production has correspondingly fallen off. The yield in 1933 was 4,208,131 kilogrammes valued at ¥1,440,017.

Of the principal vegetable oils produced in Japan, only wood and camellia oils and vegetable wax are pressed from domestically grown seeds, all the others obtain their materials from abroad. Soy bean oil, rapeseed oil, and vegetable wax are exported, their total amount in 1934 being ¥6,905,000. The importation of vegetable oils is very small indeed.

Digitized by Google

The Industry in 1934 The price of ¥25 per 100 kg. of hardened fish oil was maintained firm till the end of April. In May the appearance of the outsiders such as the Okuyama Soap, the Lion Soap, the Chosen Oil Co., etc. made the control of the cartel weak, and the market price declined continuously until September.

After September, owing to the report on the probable shortage of oil in America, due to short crops of cotton seeds caused by drought, along with failures of crops of soy beans in Manchoukuo and groundnuts in India, the hardened oil market became firm. The market price in the year follows:

MARKET PRICE OF HARDENED FISH OIL

(in yen per 100 kg.)

Month	Price	Month	Price
January	25	July	20
February	25	August	18
March	25	September	18
April	25	October	20
May	23	November	20
June	22	December	22

The Lion Soap Co., Ltd. with 200 tons hardened oil production capacity per month, the Okuyama Soap Co., Ltd. with 300 tons production capacity and the Chosen Oil Co., Ltd. with 500 tons production capacity were established. These outsiders as well as the activities of the Yamamasu Oil Co., Ltd. weakened the control of the cartel. Later in the year, however, with the solution of problem of import of the Korean fish oil, the Chosen Oil Co. became a member of the cartel, which has resulted in strengthening control. Production of 68,000 tons and export of about 24,000 tons in 1934 showed gains over 61,000 tons and 23,400 tons respectively of 1933.

Statistics Statistics for the oil industry follows:

Imports and Exports

The importation of rubber manufactures is decreasing each year. Tyres for automobiles, hose, belting for machinery, old rubber, etc., are the principal imports, but hose and belting of domestic manufacture are rapidly replacing the imported articles. On the other hand, the exportation of rubber manufactures is developing rapidly, especially in the case of rubber shoes.

Cultivation of Gum Trees

Plantation work by the Japanese was started as early as 1906 in the Malay States, and was later extended to Sumatra, North Borneo and other places. Soon afterwards a great interest was taken in the industry, Japanese investments quickly grew, and the work that was originally started as a private enterprise is now mostly carried on by joint stock companies.

Rubber

Introduction

The rubber industry in Japan began with the establishment in 1886 of the Mitsusuchi Rubber Company, a limited-partnership concern, in Tokyo. The industry developed steadily through the Sino-Japanese and the Russo-Japanese Wars of 1894-1895, and 1904-1905. In 1909 there were 20 mills, 900 workers and production reached ¥4,000,000 in value. During the World War the industry further developed. The earthquake of 1923 destroyed about 80% of the rubber manufacturing capacity of Tokyo and Yokohama districts, and many people were gravely doubtful as to whether the rubber factories in those districts would ever revive, but reconstruction quickly took place and the factories rebuilt. In 1933 the total production in the country by mills employing more than 5 persons was as large as ¥86,704,950 in value, but the figure would be much larger if we include goods produced by people working in their own homes. The number of mills employing more than 5 persons in 1933 was 748, and the number of workers 37,974. Hyogo, Tokyo and Osaka prefectures are the chief producing centres. Production in these and other important prefectures in 1933 was as follows:

Hyogo	¥28,651,980
Tokyo	19,238,267
Osaka	13,413,820
Hiroshima	3,045,704
Miyé	1,808,520
Okayama	1,378,147
Kanagawa	6,273,573

Present Condition of the Industry

Until 1920 Japan had to import the major portion of the rubber goods she required, but the industry has now developed to the extent that imports have been reduced to a small quantity. The 1934 year import of gutta percha amounted to ¥57,337,000 in contrast to ¥29,685,000 for 1933 and ¥15,988,000 for 1932. The 1934 year exports totalled ¥37,626,000 against ¥28,193,000 for 1933 and ¥14,960,000 for 1932.

The chief articles produced are tyres, rubber shoes, toys, tubes, electric battery cases, etc. The total amount of production of rubber manufactures reached ¥86,704,000, in 1933. The following table gives statistics for mills employing more than five persons only.

1931	4,005	1,747	9,898	54,992	1,112	56,104
1932	4,438	2,191	10,563	64,827	1,054	65,882
1933	5,662	2,989	16,061	84,981	1,722	86,704

Imports and Exports

The importation of rubber manufactures is decreasing each year. Tyres for automobiles, hose, belting for machinery, old rubber, etc., are the principal imports, but hose and belting of domestic manufacture are rapidly replacing the imported articles. On the other hand, the exportation of rubber manufactures is developing rapidly, especially in the case of rubber shoes.

Cultivation of Gum Trees

Plantation work by the Japanese was started as early as 1906 in the Malay States, and was later extended to Sumatra, North Borneo and other places. Soon afterwards a great interest was taken in the industry, Japanese investments quickly grew, and the work that was originally started as a private enterprise is now mostly carried on by joint stock companies.

IMPORTS OF RAW BUBBER AND EXPORTS OF PRINCIPAL RUBBER MANUFACTURES

(unit in yen)

Celluloid

General

The Japanese celluloid industry made considerable development during the World War. Owing to a heavy demand coming from European countries, where factories were closed by the War, Japanese celluloid products once dominated the world's markets, but with the termination of the War foreign products quickly regained their position in the markets captured by Japan during the War, and for some years the industry was in a state of depression. Gradually penetration was effected by traders and exporters, and overseas markets were largely restored, especially after the replacement of the gold embargo in December, 1931. The domestic market has been prosperous for many years, without being affected very much by changes in economic conditions.

Japanese celluloid products are mainly exported to America, England, South America and Australia. They are now exported to Europe and Africa, in competition with German products, the most formidable rivals. As long as the exchange rate is low and tariff walls are not raised, the export trade is destined to be prosperous.

Celluloid manufacturing is one of the most promising industries in Japan, with total production amounting to ¥24,202,000 and exports reaching ¥14,494,000 in 1934, but it is faced with one great difficulty, that of obtaining its chief material cheaply. Camphor is the material, but as this is restricted by monopoly law its price is kept fairly high.

The greatest assets the celluloid industry in Japan has are its overseas markets, markets that are expanded yearly, cheap labour, exquisite technique and advantages in the acquisition of raw materials.

The Dai Nippon Celluloid Kaisha is the largest manufacturer. 75 per cent. of the total production in Japan comes from this company, while the remaining 25 per cent. is divided among about ten manufacturing concerns, all of small scale. The company, which has a virtual monopoly of celluloid manufacturing in this country, concentrates its energies on exporting. Nearly 80 per cent. of Japan's total exports of celluloid are the produce of this company.

The company, at a cost of ¥2,000,000, has started manufacturing films at

Digitized by Google

Ashigara at the foot of Mount Hakoné. The films were placed on the market during 1933, and it is expected that imports, which used to amount to about ¥5,000,000 annually, will largely decrease from 1934 onwards. Cellophan is manufactured at the Kanzaki factory of the Dai Nippon Celluloid Company, and is now procurable at very low prices.

Statistics Production of raw celluloid, celluloid manufactures, and exports of the same follow:

PRODUCTION OF CELLULOID BY MILLS EMPLOYING MORE THAN 5 OPERATIVES

Year	Raw Celluloid Qty in metric tons	Raw Celluloid Value in ¥1,000	Manufactures of Celluloid Toys in ¥1,000	Combs in ¥1,000	Others in ¥1,000	Total in ¥1,000	Grand total in ¥1,000
1924	3,020	9,988	1,207	4,555		5,762	15,701
1925	3,801	12,664	984	3,440		4,427	17,092
1926	3,650	9,848	1,971	3,988		5,960	15,808
1927	3,414	9,372	1,539	3,125		4,665	14,037
1928	3,989	10,992	1,724	3,825		5,550	16,542
1929	5,806	12,278	2,025	535	4,668	7,229	19,508

1932	5,700	7,974	1,040	1,056	2,145	4,242	12,217
1933	8,893	16,674	2,628	1,503	3,395	7,527	24,202

EXPORTS OF RAW CELLULOID AND MANUFACTURES THEREOF

Year	Raw Celluloid Qty in metric tons	Raw Celluloid Value in ¥1,000	Celluloid Manufactures Toys in ¥1,000	Combs in ¥1,000	Others in ¥1,000	Total in ¥1,000	Grand total in ¥1,000
1924	109	371	2,718	466	584	3,769	4,140
1925	115	399	4,265	696	510	5,472	5,872
1926	48	168	4,545	602	795	5,944	6,113
1927	77	208	4,077	715	840	5,632	5,841
1928	98	249	4,229	785	1,015	6,030	6,280
1929	208	396	5,572	963	1,834	8,370	8,767
1930	161	298	4,423	631	1,267	6,322	6,621
1931	304	504	3,041	763	920	4,725	5,230
1932	511	875	2,527	1,467	1,494	5,490	6,366
1933	1,220	2,363	3,178	3,110	2,346	8,635	11,813
1934	1,804	3,303	3,708	4,260	3,223	11,191	14,494

Note: Incongruity in the figures of celluloid manufactures in the production and exports tables is due to the fact that a large amount of celluloid manufacture is produced by mills where less than 5 persons are employed.

Matches

The Industry in the Past

A factory for making matches was first established in Japan, in Tokyo, in April, 1875, by a certain Mr. Makoto Shimizu, who had just returned from studying the subject in a French technical school and a match factory managed by the French Government. In the same year a factory was established in Osaka, and in 1877 another was established in Kobé. In 1878, three years after the first factory was established matches to the value of ¥24,000 were exported, and in succession factories were established in Shizuoka, Aichi, Osaka and Hyogo prefectures. By 1889, not only had the importation of matches ceased,

Digitized by Google

but large quantities, in face of strong foreign competition, were being exported to China. In 1887, Hyogoken Match Seizogyo Kumiai (Association of Manufacturers of Matches in Hyogo prefecture) was formed and in 1900 the Dogyo Kumiai (Association of Traders in Matches) was organized. The industry experienced great prosperity during the Russo-Japanese War, exports were made not only to China but also to the South Sea Islands, Straits Settlements and India. But from about that time the match industry began to develop in China and by 1908 it had developed to the extent that the market in China was considerably curtailed for the Japanese product, then when India raised her tariff on matches, and the Dutch East Indies imposed a consumption tax on them, exports of matches to countries in the Orient were considerably reduced. Exports for some time became almost negligibly small until they picked up in 1933, in which they suddenly increased to ¥3,248,000 from about ¥938,000 of 1932.

Present State of the Industry

There are about 140 match factories in Japan, the annual output of matches being 400,000 cases, one case containing 600 dozens. Of the total production, 220,000 cases are exported to the colonies, while 180,000 cases are consumed at home.

The development of our match industry during the World War was such as to make the industry a menace to the International Match Company. This company, therefore, commenced negotiations with and was successful in amalgamating the Nippon Match Manufacturing Co., Ltd., which was one of the Mitsui interests, and the Nippon Match Co. came under foreign management for three years, that is, until 1927, when the largest match manufacturer in Japan, the Toyo Match Co., Ltd., seeing the advantages which would accrue from co-operation with the International Match Company agreed to amalgamation. The Daido Match Co., Ltd. (The Great Consolidated Match Co., Ltd.) was organized with capital equally subscribed by Japan and Sweden, and the management was placed in Japanese hands, avoiding in this way competition in foreign markets. In Japan about 15% of the factories do not yet belong to the company, and it is necessary for the company to cooperate with these factories in order to keep up the market.

Exports The match manufacturing industry in Japan has revived since the death of Ivar Kreuger, former Swedish match magnate, in 1932. Exports increased along with the development of the industry and even in 1913 Japan's match exports totalled some ¥12,000,000 after meeting the domestic demand. During the World War annual exports were between ¥30,000,000 and ¥40,000,000, forming one of the big ten export items of Japan.

Ivar Kreuger placed the Far Eastern market under his sway after the War. Through the Swedish International Match Corporation he purchased the Japan Match Company and several other manufacturing concerns. The remaining Japanese match makers could not withstand this competition, and in 1927 had to surrender to the Swedish match influence. The export volume in 1932 went off to as low as ¥938,000 from ¥1,408,000 in 1931 and ¥1,965,000 in 1930.

Exports during the first 11 months of 1933 suddenly rose to nearly ¥3,000,000. The downfall of Swedish match interests following the sudden death of Kreuger liberated the Japanese match industry from the con-

Digitized by Google

trol of foreign capital. Exports last year were made to China, India, South Seas and other points. The 1931 output in Japan was worth ¥7,924,000, of which Hyogo prefecture manufactured ¥6,638,000, or 84 per cent. Last year's production of matches and allied articles by mills employing more than 5 operatives is roughly estimated at about ¥11,000,000 for Japan.

When the Japanese match industry was influenced by Swedish interests the export field was limited to China and part of the South Seas. America, Australia, the Near East, Africa and Europe was monopolized by Swedish interests. After Kreuger's downfall Japanese match exporters took back their old markets. With the replacement of the gold embargo Japanese products have found their way in heavy volume to their old markets. The low exchange rate and cheap labour in Japan have stimulated exports.

Exports in 1933 and 1934 follow:

EXPORTS OF MATCHES
(Value in yen)

Destinations	1933	1934
Manchoukuo	43,000	88,000
Kwantung	44,000	69,000
China	1,000	3,000
Hongkong	154,000	954,000
British India	88,000	83,000
Straits Settlements	234,000	401,000
Dutch India	107,000	110,000
French Indo-China	12,000	—
Asiatic Russia	136,000	111,000
Great Britain	30,000	22,000
Holland	44,000	158,000
U. S. A.	1,947,000	446,000
Hawaii	67,000	72,000
Others and total	3,248,000	2,928,000

Number of Factories The number of match factories in Japan was 143 at the end of 1933, according to the Factory Statistics of the Ministry of Commerce and Industry. Workers employed in them numbered 8,150, of whom male workers totalled 2,467 and female workers 5,683. Details were:

	No. of factories	No. of workers
Employing fewer than 10 workers	46	228
between 10– 15	14	166
„ 15– 30	27	552
„ 30– 50	15	612
„ 50–100	17	1,219
„ 100–200	15	2,054
more than 200	7	2,285

Production of matches and allied articles in recent years has been as follows:

PRODUCTION OF MATCHES, ETC.

Year	Quantity produced	Value	Match-boxes	Matchwood
	gross	yen	yen	yen
1922	28,027,173	18,949,279	11,893,910	3,404,952
1923	24,196,708	14,811,402	1,536,544	2,747,792
1924	24,786,995	15,796,641	1,459,027	1,879,584
1925	24,139,266	16,987,560	1,256,968	2,558,545
1926	24,087,312	15,667,221	1,111,140	1,566,661
1927	3,301,575	14,540,033	1,217,350	2,202,373
1928	19,471,637	12,445,793	741,202	1,383,046
1929	21,607,683	9,825,495	1,358,616	1,220,148
1930	16,722,653	7,464,081	645,765	600,047

Dyestuff

Through Governmental protection extending over many years, the Japanese dyestuff industry is now well established. Self-sufficiency will be only a matter of time, for within recent years this industry has been gaining momentum among the other industries of the country. Japan supplies 99 per cent. of all sulphuric dyes demanded domestically. Concerning ratios of high-grade dye supplies, Japan can supply 86 per cent. of miscellaneous dyes, 49 per cent. of acid dyes, 35 per cent. of mordant dyes and 26 per cent. of vat dyes for internal use. Coal-tar dyes were already exported in 1934 to the volume of 7,023 metric tons worth ¥4,259,000. Napthol and Indanthrane dyes, which are not manufactured here, Japan gets from Germany. Consumption of these dyes is approximately 150,000 kin worth about ¥3,000,000. Research in producing these dyes is underway by the Mitsui Mining and Japan Dyestuff Manufacturing Companies. Notwithstanding all this domestic activity, Japan still imports a large volume of dyes. Vat colour imports were especially notable because Mitsui Mining produced mostly artificial indigo. Imports of dyestuff in 1934 were ¥9,147,000 in value, and showed an increase of ¥1,080,000 over 1933, details of which follow:

IMPORTS OF DYESTUFF IN 1934

Colours	1933 Amount (kin)	1933 Value (¥1,000)	1934 Amount (kin)	1934 Value (¥1,000)
Basic	186,293	1,285	176,347	979
Direct	473,415	1,991	573,627	2,403
Acid	295,023	1,366	378,490	1,669
Mordant and intermediate	370,773	1,364	366,051	1,353
Sulphuric	116,885	433	142,363	427
Vat	121,284	1,465	147,465	2,147
Others	56,582	156	55,064	169
Total	1,620,255	8,060	1,839,407	9,147

The average price of these imported dyes in 1934 was ¥8.59 per kilogramme, against ¥8.29 in 1933 and ¥4.57 in 1932. As long as the exchange rate remains at about $30 and the activity of rayon industry lasts, the demand for dyes will continue in heavy volume. The domestic production of dyes during 1933 compared with the preceding four years and exports of Japan-made dyes since 1926, follow:

PRODUCTION OF SYNTHETIC DYESTUFFS

Year	Basic Qty in 1,000kg.	Basic Value in ¥1,000	Direct Qty in 1,000kg.	Direct Value in ¥1,000	Acid Qty in 1,000kg.	Acid Value in ¥1,000	Mordant Qty in 1,000kg.	Mordant Value in ¥1,000
1929	308	1,136	716	2,194	328	931	46	209
1930	347	1,265	608	1,916	217	671	36	177

EXPORTS OF DOMESTIC DYESTUFFS

	Amount (Metric tons)	Value (¥1,000
1926	474	324
1927	490	291
1928	1,166	580
1929	811	360
1930	2,085	820
1931	2,011	509
1932	4,521	1,522
1933	6,125	2,895
1934	6,423	4,259

The Government on March 16, 1933, raised the customs tariff on import dyes by 5 per cent. uniformly for protection of home products.

The Industry in 1934

Trend in General The prosperity of the industry continued throughout 1934. Plans to increase production by various companies, which were started in 1932, were completed by the end of 1933. Further plans to increase production were launched in 1934, the substance of these new plans being such in nature as to promise a great development of the industry in future. The Japan Dyestuff Manufacturing Co. is building mills in Yodogawajiri and Nishijima, while several other chemical industrial concerns are also planning to build dyestuff mills. Another noteworthy event was that the Mitsubishi interests which have been studying dyestuff for many years at last materialized their plans, for the Mitsubishi Mining Co., Ltd. established the Japan Tar Industry Co. on joint account with the Asahi Glass Co., Ltd. and their new mill in Yawata City in Kyushu has already started operation. On the other hand, plans to make Japan self-sufficient with regard to the supply of principal intermediates by those who have been hitherto exclusively engaged in dyestuff industry, have materialized to some extent.

Market Tendency The typhoon which swept the Kwansai districts in the fall gave considerable damages to dyestuff mills in those districts. This checked the downward tendency of the market which had been kept on ever since the early part of the year. Market prices follow:

Aluminium

The first aluminium manufacturing plant in Japan was erected at Omachi, Nagano prefecture, in December, 1933. The Japan Electric Industry Company, formerly known as Japan Iodine Company, runs it. This concern also built the first alumina factory at Koyasu, Yokohama, in the spring of the same year. At the Koyasu factory Korean alum is used for making 20 metric tons of alumina a day. Alumina is sent to the Omachi factory, where 10 tons of aluminium is manufactured. The production cost of alumina is ¥1,000 per metric ton. This factory has yearly productive capacity of 3,600 tons, but Japan's annal demand is 10,000 to 12,000 tons, which used to be entirely imported from abroad. The capitalization of this company is ¥12,000,000. Another alumina manufacturing plan has been advanced. Anticipating completion of the Jitsugetsutan Power Station in June by the Taiwan Electric Power Company, an aluminium manufacturing company capitalized at ¥10,000,000 will be founded in Formosa in June, 1934. Establishment is taking place under joint management of the Mitsui, Mitsubishi, Sumitomo and Furukawa interests. Power totalling 50,000 kw. out of 100,000 kw. to be generated by the Jitsugetsutan Station will be supplied by the Taiwan Electric organization. Promoters of the prospective company have carried on exhaustive researches into the manufacture of aluminium during the past year and have found a practical method to produce it, which is however being kept an absolute secret. The factory will be erected in Takao province, Formosa, and material which is bauxite will be imported from Borneo, Korea, the Malay Peninsula and Brazil. Approximately 50,000 kw. of electricity will be had from Taiwan Power and in the first year the firm plans to have an output of 2,000 tons of aluminium, which will be boosted to 20,000 tons in the future. This metal will be supplied to various industrial plants throughout Japan. When the annual production reaches 20,444 ton level, Japan will be self-sufficient as regards this metal. In order to clinch their market in Japan, the International Aluminium Cartel, controlled by the Melon interets in the United States, has reduced the selling price of aluminium in this country to ¥1,500 per ton. The production cost of Japanese aluminium is estimated at about ¥1,200, or ¥1,300, a ton, while that of foreign aluminium is much lower. The Mitsubishi Mining Company has decided to go into the manufacture of aluminium zinc and oil, using hydrogenation process for the latter. The company will use its large profits on coal, copper and gold to finance the expansion. Experiments have

1 Product of Japan Dyestuff Manufacturing Co., Ltd.
2 Product of Mitsui Mining Co., Ltd.
3 Product of I. G.

Digitized by Google

been completed and the experts in charge are convinced of their ability to make each of the new enterprise a success. The aluminium industry will be the first to be tried. Korean alum shales will be used in a special process worked out by the company. A factory will be built near the Miuta Coal Mine, Hokkaido, which the company operates, together with a steam power generating station capable of 30,000 or 40,000 kw.

Pyrethrum

Hokkaido is noted for producing pyrethrum flower, which is used as material for anti-insect powder in foreign countries. Pyrethrum is manufactured into powder by American companies after it is exported there, where it is largely used for mosquito incenses and anti-bed bug powder. The direct shipment from Hokkaido was made in September, 1933. Pyrethrum was formerly exported through Kobé merchants, but, owing to inconveniences, the Hokkaido Government encouraged direct shipments from Hokkaido to America. The Hokkaido Government caused pyrethrum manufacturers to organize the Manufactured Pyrethrum Industrial Guild, as the first step to the export of manufactured pyrethrum abroad. Hitherto, this was exported in the shape of dried flower. As international goods, manufactured pyrethrum is steadily gaining ground. Under encouragement of that Government, Hokkaido pyrethrum raisers are manufacturing it for direct export. Not only the United States but South Seas markets such as Saigon, Bangkok, Rangoon, Manila, Singapore, Sourabaya and Batavia, Indian markets including Calcutta and Bombay and European market such as London, Hamburg and Paris demand product. Wakayama prefecture is also noted for raising pyrethrum flower. Production and exports of pyrethrum in the last several years follow:

PRODUCTION AND EXPORTS OF PYRETHRUM

Year	Production		Exports	
	Qty in 1,000kg	Value in ¥1,000	Qty in 1,000kg	Value in ¥1,000
1930	5,979	3,249	—	—

1934	—	—	93,848	7,447

Survey of Industrial Activities in Japan in 1934

New Capital Amount of capital absorbed by different kinds of manufacturing industries is detailed in the table given below. New capital invested in 1934 amounted to ¥1,565,159,000, it including those invested in new establishments, payment for this increased capitalization and in debentures. About 62 per cent. of the total, or ¥977,589,000 were invested in manufacturing industries. If the amount invested in electric and mining industries were included the sum would reach ¥1,212,901,000 or more than 77 per cent. of the total amount, and shows how industrial activities in Japan in 1934 centred around the manufacturing industries. The table given below is prepared from the Commercial Register, and shows that expansion of metal, machine manufacturing, cement, chemical, and textile industries are specially remarkable:

Principal Companies Earnings of manufacturing industries in the latter half of 1934 was 15.5 per cent. as compared with 14. per cent. in the corresponding period of the year before, and showed an improvement of 1.5 per cent., although, earnings of a considerable number of companies decreased, some of them having been forced to reduce dividend. It is generally thought that the earnings of manufacturing industries reached the peak in 1934.

Demand on Labour According to the investigation made by the Bank of Japan, the index number of labour at the end of 1934 was 95.5 and made a steady gain since January without a break. The index number of wage rate was 82.2 at the year end. Though this was slightly lower than 84.1 of January, the index number of earnings of the total labour was 95 at the year end as compared with 87.8 of January, and shows how busily the manufacturing industries were kept. Especially the index number of labour in machine manufacturing, shipbuilding, rolling stock, metal industries as well as that of textile industry and those making goods for exports showed a great increase over 1933. A table illustrating this follows :

INDEX NUMBERS OF EMPLOYMENT AND WAGES

(Average for 1926=100)

Year	Employment	Wage rates	Earnings By all labourers
1931 average	74.4	91.3	90.7

Damages by Typhoon The damages sustained by the typhoon and flood, September 21, 1934, to manufacturing industries in Osaka prefecture were very severe. According to investigations made by the prefecture, the number of mills damaged was more than 1,200 which affected more than 117,000 officials and operatives. The damages of mills without reference to the loss which arises from inability to operate amounted to ¥27,929,000. Details follow:

Descriptions	No. of mills	Damages in ¥1,000
Dyeing and textile	373	6,309
Machinery	368	14,910
Chemical	312	5,345
Foodstuff	65	326
Miscellaneous	93	792
Specific	19	248
Total	1,230	27,929

The above-mentioned figures apply only to those mills which come under the factory law. If, therefore, small industries run on domestic basis, to which the law does not apply, were included, the figures would be much larger.

The percentage of damages as against the total capacity in Osaka prefecture was 12.8 per cent. in number of mills, and 47.8 per cent. in number of officials and operatives. It was estimated that operation of damaged mills would begin after two months and the complete revival of production would take six months.

As regards the loss which is due to mills' inability to operate, it was estimated that 51 per cent. of production capacity of Osaka city and 43.9 per cent. of capacity of local districts, or 49.6 per cent. of the total capacity of the whole prefecture, which corresponds with 8.6 per cent. of the country's total production capacity, was damaged.

Extension of Production Capacities The year 1933 was a year in which extension of production capacities in almost all lines of industries was undertaken. It is true that this tendency was continued in 1934. But the year 1934 was reserved to see what the result of extension of capacities would be. In most instances demands were good, and in some cases such as in steel industry, which increased production by about 30 per cent., supply was not enough and the price was steadily upward.

On the other hand, industry like cement seems to have gone too far, and was forced to curtail production by as large as 57 per cent., while its market was disturbed through the competition between its cartel and the outsiders. Rayon industry, the production of which totalled as much as 1,370,000 cases, was scarcely able to dispose of the product through exports, its market sharply declining through the fear that its export would be barred abroad as well as the approach of opening of operations of newly established mills.

Cartels and Rationalization Policy The industrial rationalization policy of the Government has had its effect upon many industries. It also had bearing on bringing forth some new cartels and strengthening the old ones. Many of these cartels, such as those of steel, beer, paper, coal, petroleum, cement, and rayon were active. But control of these cartels was, in many instances, weakened by the activities of the outsiders and many of them were forced to realize the importance of further strengthening their organization.

However, where the strength of a cartel was really felt, there arose sharp criticism against it, or a claim lodged by the consumer, due to pulling up of price by the cartel, or withholding delivery of goods desired. In the instance of the steel industry, the Japan Iron Manufacturing Co., Ltd. was born as the result of the Government's rationalization

Digitized by Google

policy. The control exercised by this company was effective. But it produced an effect which the Government could not foresee. The supply of steel put up by the company was not large, which resulted in the high price of steel materials. Consumers were pressed very hard, and the movement for reducing the price of steel materials drew attention of the public, which caused the Government to contemplate to lower duty on steel. Troubles of similar nature arose in fertilizer industry, where the supply of ammonium sulphate became short, and a dispute arose between the fertilizer cartel and the representatives of farmers as to the import of this fertilizer. In the case of paper industry, the monopolistic control of the cartel was directly opposite to the interest of the newspaper and magazine people, while in beer, sugar and confectionery industries the cartels aroused a suspicion of the masses. These disputes almost always arose in connection with the question of prices, and the number of them increased as the time progressed and the acuteness intensified.

Under these circumstances, the policy of the Government to effect the rationalization through the control of various industries by cartels met a great stumbling block and the Government has been forced to conceive a new idea to change the original policy of enhancing cartels into that of regulation of cartels, and various laws were prepared with a view to carrying this new idea into effect.

Income from postage and fees	¥261,715,228
Expenditure	¥143,093,918

The Postal Service

Historical Survey

The present state postal service system was established in 1871, between Tokyo and Osaka. In August of that year, post offices were opened in Niigata, Hakodaté, Kobé, Nagasaki, and Yokohama. In December a new postal route was established between Tokyo and Nagasaki, connecting the two cities in 7 days and 17 hours. In May, 1872, the postal service between Yokohama and Tokyo was greatly improved by the establishment of five deliveries a day, and by July the service was extended to all the cities and towns of importance throughout the country, except a part of Hokkaido.

Foreign Mail Opens In March, 1872, a foreign mail service was opened at the same time as the establishment of official postal regulations. In those days, foreign mail matter in Japan was handled with the aid of the British, American, and French post offices in Yokohama, Kobé and Nagasaki. Soon after the conclusion of the America-Japan Mail Service Treaty in 1873, the American post offices were withdrawn from this country, and Japan was thus placed on an equal footing with the U. S. A. as regards the mail service between the two countries. In 1877, an arrangement was made with twenty-five countries participating in the International Mail Service Treaty. Thereupon, the British and

Digitized by Google

the French post offices were also withdrawn from this country.

The post offices were at first classified into five grades, and in March 1886, they were classified into three as at present. In view of the development of telephone and telegraph business, the authorities introduced a revision in the system of the Communications Department in 1903, and divided post offices into post, telegraph, and telephone offices each of them being classified into 1st, 2nd and 3rd, or 1st and 2nd in the case of telephone offices. With the rapid increase in the amount of mail matter and telephone and telegraphic messages, the regulations of the Communications Department as to the number and kind of offices, were extended from time to time, and at present there are offices in warships, steamers, trains, etc., in addition to the network throughout the country.

The air mail service was commenced in 1929 with the establishment of the Japan Air Transport Company in April of the same year.

The Growth The rapid growth of the postal service in the early years is illustrated by the following statistics :

Year	No. of P. O.
1871	180
1872	1,160
1873	1,501
1874	3,245
1882	5,527

Following the introduction of a revision in the postal service regulations in 1883, some of the offices were eliminated, the number being reduced to 4,088 by the end of 1889. But the steady development of postal business necessitated an increasing number of offices as the following figures for Japan proper show :

On March 31 of	No. of P. O.
1907	5,485
1922	6,709
1923	8,477
1924	8,546
1925	8,633
1926	8,705
1927	8,916
1928	9,114
1929	9,393
1930	9,690
1931	9,954
1932	10,208
1933	10,322
1934	10,611

Post offices are classified into three grades, namely 1st, 2nd and 3rd, the 1st being, side by side with 2nd and 3rd offices, in such important places as Tokyo, Osaka, and other leading cities. The 2nd and 3rd are in smaller cities, towns and villages throughout the country. Those of the 1st or 2nd grade are government offices, under direct government management. In post offices of the third class, business is conducted on the contract system.

Its Business

In addition to ordinary matters relating to post and telegrams, the post offices in Japan receive taxes on behalf of the various tax authorities and pay pensions, annuities, etc. on behalf of the Treasury. Since 1906 New Year's greeting cards have been handled separately from ordinary mail matter with a view to relieving congestion. Such mail matter is accepted by all post offices from December 15 until 29 of the same month for delivery on New Year's day.

Ordinary mail matter is delivered 5 or 6 times daily in Tokyo, Osaka, and Kyoto, and 4 or 5 times in other large cities, where there are 1st class offices. In smaller cities, the 2nd class offices deliver 3 or 4 times a day. In towns and villages where they have 3rd class offices, mail matter is delivered twice a day only. The number of collections is the same as that of delivery in most cases.

Digitized by Google

The parcel post service was started in 1892, the first arrangement as regards foreign connections being made with Hongkong in 1879. The scope of international service was gradually extended, and covers almost all treaty countries at present.

Statistical Tables In the following are given a number of tables relating to the volume of business, and its growth, handled by the post offices:

NUMBER OF POST OFFICES (September 30, 1934)

	Japan Proper	Taiwan	Karafuto	Chosen	Kwantung Leased Territory	South Sea Islands
1st Class	87	12	—			
2nd Class	221	10	4	98	56	9

Postal Money Order can hardly be included into the business of communications. It is, however, one of the important lines of business handled by the post office for the convenience of the large mass of people. The number and amount of postal money orders handled during 1933-34 are given below:

POSTAL MONEY ORDERS IN 1933-34

DOMESTIC

Territory	Issued No.	Issued Amount (in yen)	Paid No.	Paid Amount (in yen)
Japan Proper	33,332,829	682,431,763	35,208,631	731,180,972
Taiwan	1,051,069	27,736,385	610,567	16,612,763

Telegraph Service

Telegraph service in Japan was started in August, 1869, but this was for Governmental messages exclusively. Public telegraph service was started in September of the same year between Tokyo and Yokohama. Telegrams in European languages were despatched for the first time in April, 1870. In August of the same year Osaka and Kobé began to exchange telegraph messages. In June, 1871 the laying of the submarine cable between Nagasaki and Shanghai was completed. In February, 1873, aerial lines connected Tokyo and Nagasaki and telegraph service for districts along the lines was opened. In January, 1879, Japan entered the international telegraph association. With revisions of rules and laws in subsequent years the business was started on a fair and steady road of progress. Wireless telegraph service was installed in 1908, and telegraphic picture transmission was undertaken from August, 1930.

Statistics on the telegraph services follow:

Wireless Telegraph Service

The study of wireless telegraphy was begun in Japan in 1896, or one year after the invention of wireless telegraphy by Marquis Marconi. In 1903, an experiment was made between Nagasaki and Taiwan by the Communications Department, with satisfactory results.

The First Station In November 1906, Japan sent her delegation to Berlin to represent her at the First World Conference on Wireless Telegraphy. In May, 1908, the first land wireless telegraph station was established in Choshi, (Chiba prefecture), whilst the first marine wireless telegraph equipment was set up on the Toyo Kisen liner "Tenyo Maru" in the same year. In July, 1908 wireless telegraph stations were established at Ohsezaki in Nagasaki prefecture, Shionomisaki in Wakayama prefecture and Tsunojima in Yamaguchi prefecture. In December, 1908, a wireless telegraph station was established at Otchishi in Hokkaido. At the same time sets were installed on some of our ocean liners. Japan was thus placed on a more or less secure foundation in the sphere of wireless telegraphy.

The circulation of regulations for private wireless telegraph offices in October, 1915, greatly facilitated the healthy growth of the business, and the service was extended to wider areas. It was utilized for steamship communication, and contact was also made with steamers and between ships and land stations, and also between aeroplanes and steamers or stations on land. With the enforcement of a law for the establishment of wireless sets on steamers, the number of stations rapidly increased.

International Communication The extension of wireless communication with other countries started in Japan in 1915, when messages were exchanged between Otchishi station and Petropavlovsk of Kamchatka. In 1916, the Funabashi station succeeded in exchanging messages with Hawaii. In 1920, the Iwaki station was established for handling mes-

Digitized by Google

sages between Japan and America. In 1925, the Government issued a law establishing the Japan Wireless Telegraph Company with a capital of ¥20,000,000, with a view to becoming absolutely independent of foreign telegraph companies, with whose co-operation Japan had been exchanging wireless messages with all other countries, except America, Russia, and China.

The Government transferred to the Company its Iwaki radio plant and the ground at Yosami and Yokkaichi which it was holding with the intention of erecting radio stations for the services with countries in Europe.

The Company has, according to the Law, to equip and manage the facilities and then rent them to the Ministry of Communications in consideration of a subsidy. Although many improvements were introduced at considerable outlay over all former installations of Iwaki radio plant by the Company, the advent of short-wave methods compelled it to close the stations upon the completion of its new stations at Oyama and Fukuoka.

The Company's circuits now offer from Nagoya direct communication service with England, France, Germany, Italy, Switzerland, Poland, Holland, Mexico and Brazil; and from Tokyo the circuits reach out to North and South America, Hawaii, the Philippines, French Indo-China, Siam, Dutch Indies, British India, and Syria. The Company has an extensive plan of development which will in future place Japan in direct touch with all the important countries of the world.

The Company now places the following stations in daily twentyfour hour service:

(a) Transmitting station at Oyama, near Tokyo.

Receiving station at Fukuoka, near Tokyo.

(b) Transmitting station at Yosami, near Nagoya.

Receiving station at Yokkaichi, near Nagoya.

Stations (a) are used for direct communication with San Francisco, Buenos Aires, Honolulu, Manila, Saigon, Bangkok, Bandoeng (Java), Bombay and Beirut (Syria); and, stations (b) for direct communication with London, Pari, Berlin, Rome, Geneva and Warsaw.

Messages originating in or destined to places beyond those mentioned above are retransmitted at those particular points.

Number of telegrams dealt with at wireless telegraph offices in recent five years was as follows:

		Domestic	Foreign
1928–29	Despatch	343,540	48,303
	Arrival	209,044	23,296

Wireless Telephone Service

The first experiment with wireless telephony in Japan was made in 1911 by the Communications Department, with very satisfactory results. It was in 1923, however, that the service was opened for public use between Kobé city and steamers in the harbour. In 1926, this service was extended to Moji. The result being satisfactory, the Government decided further to extend the service and in December, 1932, the International Telephone Company, with a capital of ¥10,000,000, was established through the solicitation of the Communications Ministry to build up stations for the use of the Government and private bodies. This was done to facilitate wireless telephone service between Japan and the world at large, Japan's colonies and ships on the waters. The transmitting station of the company is established at Nazaki, Ibaraki prefecture, and the receiving station at Komuro, Saitama prefecture, and these stations are connected each other and with the Tokyo Central Telephone Office by cables. Wireless telephones are now available between Tokyo, Nagoya, Kanazawa, Kobé, Osaka, Kyoto, Yokohama, Toyohashi, Nara, Himéji, Shimonoséki, Fukui, Fukuoka, Yawata, Wakamatsu, Nishinomiya, Amagasaki and Suma. The service has been opened between Formosa and Tokyo, on June 20, 1934.

In 1934-35 international wireless telephone service has been successively opened between Japan and Manchoukuo, U. S. A., a part of Canada, Cuba, Philippines, Java,

Digitized by Google

Smatra, England, and Germany. The service with other European countries will be opened soon.

Telephotograph Service This service is only available between Tokyo, Osaka and Formosa.

Radio

Radio broadcasting in Japan is under the control of a single organization, the Broadcasting Corporation of Japan, which in turn is supervised by the Ministry of Communications. Programmes are subjected to strict censorship and nothing that might harm the interests of the country and its people is allowed to go on the air. Advertising of all sorts is prohibited. Political speeches cannot be included in the daily programmes. Even election campaign speeches and Diet proceedings cannot be broadcasted. (See Chapter XXXVII.)

The First Programme The first radio programme in Japan went on the air on March 22, 1925, five years after the world's first regular commercial broadcasting by the station KDKA, East Pittsburgh, Pennsylvania. The station, using the call letters JOAK, was in Tokyo, and it had a power of only 500 watts. This station, established temporarily at Shibaura, on the water front of Tokyo Harbour, was replaced in July by a 1 kw. station at Atagoyama, a hill in the southern part of Tokyo. In the difficult times following the great earthquake and fire of September, 1923, which laid waste a greater part of Tokyo, the radio played an important part in comforting and encouraging the citizens who were working hard to rebuild their city and their homes.

Shortly afterwards, small stations were established in Osaka and Nagoya, which form with Tokyo the three largest population centres. The engineers in charge of these stations were sceptical about their success. There was no assurance that the Japanese public would respond by buying radio sets and listening in, or would like the programmes once they were heard. These fears, however, were groundless. For a time there were not enough receiving sets in the stores to meet the demand. Instead of a novelty, the radio became a daily necessity. Elated at their success, the promoters worked out a plan to centralize all the broadcasting in the country, which was heartily approved by the Ministry of Communications. Before the end of a year, the stations in Tokyo, Osaka and Nagoya were merged, and the Broadcasting Corporation of Japan was formed to assure nationwide cooperation in meeting the demand for more efficient stations and better programmes.

The Subscribers The association started with 338,000 subscribers; on March 30, 1935, it has 1,979,096 or 30.6 in 1,000 of population. The present fee is ¥0.50 for each receiving set.

The Stations The development so far made has been in two directions, an increase in the number of stations and improvement in programmes. In the beginning there were three stations. Now there are 25, and several more are to be added. As the association was meant to be nationwide, every section of Japan had to be considered. The directors called in the engineers and explained the problem. Broadcasting had to be available in any home anywhere in the country. The engineers pointed out that the geographical formation

Digitized by Google

of Japan, which stretches more than 3,380 kilometres from Hokkaido to Taiwan, broken by rugged mountains, made it advisable to broadcast from a number of stations suitably located. The country was divided into seven districts, in each of which a 10-kw. station has been built. These—in Tokyo, Osaka, Nagoya, Hiroshima, Kumamoto, Sendai and Sapporo—are the key stations. The remaining 18 are relay stations, ranging in power from 300 watts to 3 kilowatts. Their purpose is to bring the programmes of the seven key stations closer to the listeners, saving them the expense of powerful receiving sets. For double broadcasting, the power of the Tokyo, Osaka and Nagoya stations was increased to 20 kilowatts.

International Broadcasting In 1930 Japan was able to undertake international broadcasting for the first time. The message of King George at the opening of the Naval Conference in London was clearly heard.

News was broadcasted from the League of Nations at Geneva on February 21, 1933, the opening speeches at the World Economic Conference was sent from London on June 12, and the reports by the Japanese delegates on July 24. The first international broadcasting between Germany and Japan was undertaken on November 15, and again on December 19. For the celebration of the birth of the Crown Prince of Japan international broadcasting was exchanged between Tokyo, Osaka, Geneva, New York and Berlin in December and on January 4, 1934. In 1934, 31 international broadcasts were exchanged between Japan and different countries of the world.

Overseas Broadcast The Overseas Short-wave Broadcast has been fixed as follows: for Europe and the Pacific Ocean 2:00-3:00 P. M.; for American continents and the Atlantic Ocean 6:00-7:00 A. M. on Tuesdays and Fridays.

These broadcasts will be sent out from the Nasaki Transmitting Station of the Japan International Telephone Company.

Location :—Nasaki, Ibaraki Prefecture, Japan. Position, Latitude 36° 10′ 44″ North : Longitude 139° 51′ East.

Transmitter—20 kw.

Wave length and Frequency :—JVH 20.55 metres 14,600 kilocycles.

Any change in wave length and frequency will be announced during the course of the regular daily broadcast.

Daily broadcast programme will be as follows :

Opening announcement and résume of the day's programme	10 minutes
News in English	10 minutes
Music entertainment, lectures, broadcasts from the scene of actual happenings or from the leading theatres and centres of amusement	30 minutes
News in Japanese	10 minutes
Resume of the following day's programme and concluding announcement	4 minutes
National Anthem	3 minutes

These make up the full one hour programme on the Overseas Broadcast.

In the near future the Tokyo station is to be increased to a power of 150 kilowatts and other stations to 100 kilowatts.

The extension programme also includes the construction of a large building for each of the studios in Tokyo and Osaka, which will incorporate the latest type of broadcasting equipment. These two cities will thus continue to be the broadcasting centres of the Empire.

The B. C. J. The Broadcasting Corporation of Japan was organized on August 20, 1925. The organization, being a public service corporation with no desire for profit, obtained a special charter with right to control and operate the whole broadcasting

Digitized by Google

service in Japan and to undertake any scheme for the promotion of radio science, although all work is subject to the supervision of the Ministry of Communications. The corporation is headed by Mr. Kenzo Iwahara, former chairman of the Board of Directors of the Tokyo Broadcasting Station.

Business conditions of the corporation in 1931-1933 were as follows :

SUBSCRIBERS

(Japan Proper)

At the end of	Number of subscribers	Increase over the previous year	Percentage of the increase
1931	948,822	214,087	29
1932	1,320,143	371,321	39

CHAPTER XXV

LAND AND AIR TRANSPORTATION

State Railways

Historical Background

Japan's railway projects date from 1869, when the Government formed a plan to lay a trunk line linking Tokyo with Kyoto and Kobé, together with some branches to Yokohama and Tsuruga, a port on the Japan Sea. As the first step, half a million yen was sanctioned for the work between Tokyo (Shimbashi) and Yokohama, but the State Treasury was in no position to find this amount, while private capital declined to venture into this novel field of investment. It was at this time that an Englishman, Horatio Nelson Lay, by name, came forward with a proposal to furnish the required funds. The terms offered by him were accepted and a Japanese loan for one million sterling was placed on the London market. With the arrival of a British engineering corps and materials, the first sod was dug on the 28.962 kilometre Shimbashi-Yokohama section in March, 1870, and on the 32.18 kilometre Kobé-Osaka section in November, 1870. The gauge adopted for these lines was one of 1.067 metres, which has later become the standard gauge of the Japanese railways.

Tokyo-Yokohama and Other Lines The work between Shimbashi and Yokohama was completed in September, 1872, while the Kobé-Osaka line was opend to traffic in 1874 and its further extension to Kyoto in 1877. These sections have practically formed the nucleus of what now constitutes the Tokaido Line, one of the main arteries of railway traffic in Japan. In 1880, the Kyoto-Otsu section was completed and in 1884 a further extension with a length of 41.834 kilometres between Tsuruga and Nagahama, a town along Lake Biwa, was completed and opened to traffic in pursuance of the railway idea of linking up the Pacific and the Japan Sea. Meanwhile, a survey was made on the Otaru-Horonai section in Hokkaido, where colonization work was being strenuously encouraged. Construction of this section was soon undertaken and the 88.495 kilometre length was opened to business in 1882, thus bringing the total length of railway under Government ownership toward the close of 1884 to 185.035 kilometres.

Private Lines About this time the Government was in financial difficulties and the building of State railways practically came to a standstill except for a few extensions. It was at this time that, not being in a position to undertake the work itself, the Government began to encourage private enterprise, the encouragement mostly being in the shape of subsidies. Under these circumstances, many private railways were built in rapid succession, the most notable among them being the Nippon Railway, the Sanyo Railway, the Kyushu Railway and the Hokkaido Colliery Railway. The total length of line thus built by private capital in the ten years between 1881 and 1891 aggregated 1,874.485 kilometres, a length more

Digitized by Google

than double that of the State which did not exceed 886.559 kilometres by the end of 1891.

The Trunk Line Prior to this, the Government decided to lay a trunk line through the Nakasendo, the old mountainous highway of Central Japan, but in view of engineering difficulties along this line it was subsequently abandoned in favour of the level region of the Tokaido. Work on the new route was finished in July, 1889, whereby a through service was opened for a distance of 611.42 kilometres between Tokyo and Kobé. Then a branch to Yokosuka was opened and a 160.9 kilometres section between Takasaki and Naoétsu was completed with the exception of 9.654 kilometres over the Usui Pass. This difficult section, for which the Abt rack rail system was adopted, was not opened for service until 1893.

The Railway Construction Law In view of the industrial progress being made in the country there was an urgent demand for the speedy construction of more railways. The entire length of Japanese railways at that time amounted to only 2,574.4 kilometres and as many as 5,792.4 kilometres were needed to complete the railway network over the whole country. The bulk of these contemplated lines was in remote districts with no prospect of immediate profit, and on that account did not appeal to private enterprise. These circumstances showed both the Government and the public the advisability of State acquisition of private lines and opinion was further strengthened by the financial failure of some of the private concerns. In view of this, in 1892, the Railway Construction Law was passed and the Government set to work constructing important lines. The law embodied a comprehensive programme of railway building and contained the guiding principles on which the railway system of Japan was founded. At the same time the matter of consolidating the different lines into one complete system was being studied by a committee of enquiry appointed by the Government. The acquisition of private railways was accomplished in October, 1907, the subsidiary businesses being taken over at the same time. Immediately after nationalization the State Railways were organized under a Railway Bureau, which was directly responsible to the Cabinet. But in May, 1920, a separate Department of State was created to deal with railway affairs and the Minister of Railways was appointed to control it.

Railway Network

The law of 1892 authorized the Government to build certain specified lines within a certan limit of time, and also to buy up such private railways as were judged necessary for the completion of a unified system. Pursuant to this programme the State Railways proceeded with the work of construction and in 1906 and 1907 purchased 17 companies' lines to a total length of 4,547.034 kilometres, thereby bringing under national control all the railway lines in Japan proper, with the exception of feeding lines of local importance. In 1922 after a careful survey of the State lines the Railway Construction Law was modified and some new lines were added to the original programme. At the same time it was decided that, pursuant to the new law, such local lines as formed a connecting link between the State lines projected or those lines considered necessary for completing a unified national railway system be purchased.

The total length of State lines not yet opened to business on March 31,

Digitized by Google

1933, was 3,690 kilometres representing 1,098 kilometres of lines under construction and 2,592 kilometres of lines sanctioned, but not started on within the year. As compared with the preceding year the lines under construction increased by 375 kilometres and those to be started on increased by 102 kilometres.

Organization and Staff

Prior to the nationalization of the private lines, the State lines were operated on a departmental system based on the principle of centralization. The system worked well because the management of the State lines was a relatively small business, but when the Government assumed the management of all lines it was found unequal to the extra work, and in December, 1908, the Imperial Government Railways were removed from the control of the Minister of Communications and assigned to a newly created administrative body, the Railway Board. The administration was then decentralized and remains so to-day. The existing system of organization of the State Railways was established in May, 1920, when the said Railway Board was made, by virtue of Imperial Ordinance No. 143, an independent department of the Central Government. According to the regulations, the Department of Railways not only controls the whole of the State lines, but supervises the provincial railways and tramways in Japan proper. It maintains one central and six regional offices. The Central Office is directly governed by the Minister of Railways and manages all matters relating to the State Railways as well as maintaining supervision over provincial railways and tramways. It is composed of eight departments according to the kinds of business dealt with. These are the Minister's Secretariat; Bureau of Local Railway Administration; Bureau of Traffic and Operation; Bureau of Construction; Bureau of Maintenance and Improvement; Bureau of Mechanical Engineering; Bureau of Electricity; and Bureau of Finance and Purchase. The Central Office also controls Regions, District Construction, District Improvement, District Electric Offices and Tokyo Railway Hospital. On April 23, 1930, by virtue of Imperial Ordinance No. 83, a further bureau, the Board of Tourist Industry was created as a separate bureau of the Department of Railways. The bureau is controlled by the Minister of Railways and attends to the business of the tourist industry, its object being to encourage people of other lands, by advertising and in other ways, to visit Japan and see her incomparable scenic beauty, natural charm and national manners and customs, and to encourage Japanese living at home to take trips to different parts of the Empire.

As stated above, the administration of the State Railways is decentralized into six regions, Tokyo, Nagoya, Osaka, Moji, Sendai and Sapporo. Each region is a complete unit and is in charge of a director who is vested with power to conduct, at his own discretion, all affairs relative to his jurisdiction, excepting matters of general and large import for which decision of the central administration has to be obtained.

On the State Railways of Japan the members of the staff are either Government officials or employees. On March 31, 1933, there were altogether 198,848 servants in the employment of the State Railways as against 198,678 in the preceding year. The total salary for the year under review was ¥136,735,245. This shows an increase of ¥2,446,023 (1.8%) from the year before. The average annual salary was ¥688.

Digitized by Google

Finance By Railway Special Account Law, enforced since 1909, the budget of the State Railways was made separate of the general finances of the State. Furthermore, the law provides that all capital expenditure for railway construction and improvement should be met from the revenue accruing from all sources of traffic and that the expenditure should, in case the revenue is not sufficient to cover it, be supplemented by the proceeds of public loans issued as a charge on this special account.

Traffic

Goods and passengers carried by the State Railways in Japan proper since 1914-15 follow:

Fiscal years	Goods	Passengers	Goods revenues	Passenger revenues	Daily average revenue per km.
	metric tons	(unit in 1,000)	(¥1,000)	(¥1,000)	(In yen)
1914-15	35,337,241	166,092	51,750	54,671	88
1919-20	60,899,557	357,881	131,809	161,546	81
1921-22	58,312,333	454,535	167,241	214,519	99
1922-23	65,095,702	512,754	179,220	232,801	103
1923-24	65,818,955	579,288	178,109	249,563	102
1924-25	71,178,263	640,828	194,563	259,047	105
1925-26	73,090,274	683,563	198,786	262,074	103
1926-27	74,780,409	740,333	201,609	266,199	101
1927-28	78,621,788	795,722	211,749	271,523	101
1928-29	79,762,959	847,300	220,686	285,337	103
1929-30	77,224,824	862,939	217,949	279,030	99
1930-31	64,087,099	824,152	184,146	255,086	84
1931-32	60,590,746	787,222	176,124	239,972	77
1932-33	61,732,756	781,149	174,706	233,387	75
1933-34	69,402,000	830,936	191,044	252,144	—

Note: 1933-34 figures are liable to future revision.

Activities of the heavy industries and the expansion of trade were reflected on the railway traffic business, as both the passenger fares and freight receipts went up sharply from the year before. The passenger fares for the year 1933-34 amounted to ¥252,144,000, showing a gain of ¥18,757,000, and freight receipts totalled ¥191,044,000, representing a gain of ¥16,338,000 over the preceding fiscal year.

Motor Car Service The Department of Railways inaugurated a motor car passenger service between Okazaki and Tajimi and between Seto-Kinembashi and Kozoji for a distance of 65 kilometres in the business sphere of the Nagoya Regioned Office during the 1930-31 fiscal year. This was the first venture of the kind, and as the results proved satisfactory the Department opened similar services between Mitajiri and Yamaguchi over a distance of 17 kilometres in the business sphere of the Moji Regional Office and between Kameyama and Mikumo and between Omi and Kurokawa over a total distance of 42 kilometres in the business sphere of the Osaka Regional Office during the 1932-33 fiscal year. Motor car passengers carried during the 1933-34 fiscal year numbered 2,682,764 and motor car goods carried totalled 25,770 metric tons. The passenger fares amounted to ¥496,141 and freight receipts ¥41,269, with a total of ¥537,410. Details are:

Moji	368,863	1,011	110,171	302
Total	2,682,764	7,350	496,141	1,359
Compared with the year before	(in.) 1,472,333	(in.) 4,034	(in.) 259,925	(in.) 712

Ferry Service Ferry boats working under the Department of Railways carried for the year under review 6,757,058 passengers for which the total fares of ¥4,922,154 were received. Goods transported amounted to 2,509,512 metric tons, and the total freight receipts were ¥5,263,032. As compared with the year before, passengers decreased 122,911 and the fares gained by ¥739,262; goods gained by 221,114 tons and the receipts gained by ¥539,162. Details follow:

Regional offices	Passengers		Goods	
	Number	Fares	Tons	Freights
Osaka	731,701	¥289,734	115,231	¥192,637
Moji	5,231,782	3,188,016	1,534,734	1,912,914
Sapporo	793,574	1,514,404	859,547	3,157,481
Total	6,757,058	4,992,154	2,509,512	5,263,032
Compared with the year before	(de.) 122,911	(in.) 739,262	(in.) 221,114	(in.) 539,162

Accidents The number of accidents reported on the State Railways for the year was 5,009, and the casualties numbered 2,918. This shows a gain of 174 casualties over the year before. The railway suicides numbered 2,260, a drop of 327 from the year before. The Department of Railways' shipping accidents totalled 383, a drop of 55 from the year before.

Construction

Railway construction expenses for the 1932-33 fiscal year totalled ¥47,743,368 in contrast with ¥37,706,907 for the 1931-32 year and ¥41,715,774 for the 1930-1931 year. The same for 1933-34 amounted to ¥53,130,133. In 1933-34 the total length of new lines under construction was 1,188.4 kilometres.

Total Length

The total business length of the State Railways for the 1933-34 fiscal year was 15,737 kilometres and the total length of line 25,612 kilometres, showing an increase of 470 kilometres, showing an increase of 470 kilometres in the former and 619 kilometres in the latter. Details are:

Digitized by Google

Regional offices	Business mileage	Total length of rails
Tokyo	1,983 (In kms.)	4,514
Nagoya	1,901	3,255
Osaka	2,957	4,906
Moji	2,757	4,450
Sendai	3,092	4,252
Sapporo	3,044	4,232
Total	15,734	25,612
Compared with the year before	(in.) 476	(in.) 619

Workshops

The number of factory operatives of the Department of Railways at the end of 1932-33 fiscal year was 14,188, to whom the monthly salary of ¥904,027 was paid. The factory production for the year totalled ¥35,965,491, showing a drop of ¥954,821 from the year before. Of this production ¥21,501,139 was for the repairing of rolling stock; ¥2,925,481 for the improvement of rolling stock, ¥1,245,872 for the manufacturing of rolling stock, and ¥10,283,999 for the manufacturing and repairing of railway stores.

Rolling Stock

The total value of rolling stock was ¥642,463,151, representing an increase of ¥8,901,079 from the year before. The amount of rolling stock owned by the State Railways on March 31, 1933, was 3,953 steam locomotives weighing 329,767 tons; 131 electric locomotives weighing 9,272 tons; and 10 special locomotives weighing 210 tons, with the total of 4,094 weighing 339,250 tons, showing an increase of 78 cars and 4,482 tons from the year before.

On the same date, the number of passenger cars was 10,418 with accommodating capacity for 651,389 people showing a drop of 342 cars and capacity of 2,817 from the year before. The number of freight cars was 64,923 with carrying capacity of 864,737 tons, indicating a drop of 215 cars and 4,208 tons from the year before.

On March 31, 1934 there were 3,913 steam locomotives, 141 electric locomotives, and 10, special locomotives with the total of 4,064 weighing 335,233 tons, a decrease of 30 in number and 4,018 in tonnage as compared with the previous year. The number of passenger cars was 10,629 with accommodating capacity for 672,782 people, an increase of 211 cars and 26,393 seats as compared with the preceding year. The number of freight cars was 65,804 with carrying capacity of 873,998 tons, an increase of 881 cars and 9,261 tons as compared with 1933.

Electric Power

The State Railways had four stations, 31 sub-stations and 13 transforming stations on March 31, 1933. The status of these electric stations on March 31, 1933 and 1934 follows:

	Dynamos		Prime motors and converters		Transformers	
	No.	Volume h.p.	No.	Volume kw.	No.	Volume k.v.a.
1933	12	122,244	138	305,653	402	667,944
1934	10	121,944	136	308,653	443	668,694

Electric power supplied by the State Railways' electric power stations for 1932-33 amounted to 139,197,271 kw. h. for which ¥1,300,223 were required. The net expenses per kw. h. was a little more than 9 rin (¥0.009). As compared with the year before, the supply dropped 107,938,492 kw. h. and expenses also ¥639,822, but the kw. h. expense increased 1.32 sen. Power supplied to the sub-stations for the year totalled 287,959,540 kw. h. with expenses of ¥4,564,114. The kw. h. expense was 1.6 sen. As compared with the year before, the power sup-

ply gained 23,694,608 kw. h., and expenses increased ¥194,507. The kw. h. expense declined 0. 7 rin.

Finance

The State Railway revenue for the 1933-34 fiscal year totalled ¥870,165,166 against ¥761,894,098 for the 1932-33 fiscal year, while expenditures totalled ¥770,366,710. Revenue and expenditures since the 1926-27 fiscal year follow:

Fiscal years	Revenue (in yen)	Expenditures
1926-27	947,386,218	825,612,827
1927-28	1,006,458,791	859,806,853
1928-29	1,014,752,892	876,675,990
1929-30	1,004,911,356	892,160,458
1930-31	813,010,038	740,039,289
1931-32	767,657,721	678,774,890
1932-33	761,894,098	691,012,532
1933-34	870,165,166	770,366,710

Fixed assets of the State Railways for the last eight years follow:

Fiscal years	Value at the beginning of the year (In ¥1,000)	Value at the end of the year
1926-27	2,453,092	2,647,453
1927-28	2,647,453	2,858,794
1928-29	2,858,794	3,062,614
1929-30	3,062,614	3,246,724
1930-31	3,246,724	3,374,392
1931-32	3,347,392	3,413,786
1932-33	3,413,786	3,503,893
1933-34	3,503,893	3,613,169

BUSINESS INCOME AND EXPENSES
(In ¥1,000)

Fiscal years	Income	Expenses	Net profit
1926-27	484,082	353,175	130,907
1927-28	506,444	368,277	138,167
1928-29	529,256	393,380	135,875
1929-30	518,016	399,026	118,989
1930-31	458,140	382,552	75,587

Private Railways

General The status of provincial railways in operation and those not yet opened on March 31, 1934, follows:

	No.	Length (kilometres)	Construction cost (in yen)
Railways in operation	265	7,183	1,002,724,369 (estimate)
Compared with the year before	(de.) 3	(de.) 59	969,582,057 (1933 actual)
Railways not opened yet	179	3,493	774,682,515 (estimate)
Compared with the year before	(de.) 4	(de.) 252	(de.) 26,274,415

Traffic Looking over the private railway passenger traffic for 1932-33, passengers carried numbered 427,668,098 (an increase of 6,942,997 over the preceding fiscal year), for which the total fares of ¥55,430,020 (a decrease of ¥1,567,766 from the year before) was realized. The average fare per passenger was, for the year ¥0.129. Goods transported by the private railways totalled 22,212,514 tons (a drop of 552,540 tons from the preceding year), for which freight of ¥17,845,070 (a drop of ¥93,910) was realized. The freight receipts per ton were ¥0.803. Railway accidents for the year numbered 1,844 and the number of casualties 937.

Rolling Stock The number of rolling stock on March 31, 1933, was 994, of which steam locomotives numbered 809, electric locomotives 179 and gasolene locomotives 6, with the total weight of 26,117 tons, showing a decrease of 3 cars and 42 tons. The number of passenger cars was 4,478 with a seating capacity of 307,070, while that of freight cars was 11,558 with total loading capacity of 113,185 tons.

Finance Business income and expenses for the private railways for 1932-33 follow:

Others and total	2,104,840,840	(in.)	67,442,256

Employees The private railway employees numbered 41,572, in 1932-33, to whom monthly salaries of ¥1,721,251 were paid, showing a drop of 760 employees and ¥45,466 a month from the year before. The average salary for one man was ¥52 a month and remained the same as the year before.

Tramcar Service

Lines in Operation Details of the tramcar lines in operation on March 31, 1934, were:

Kinds	No. of lines	Length in kilometres	Capitalization
Electric	94	2,092.75	¥2,058,822,376
Steam	8	127.67	1,861,000
Steam & gasolene	9	101.23	3,795,000
Gasolene	14	136.71	23,257,000

Digitized by Google

Kinds	No. of lines	Length in kilometres	Capitalization
Horse-power	14	137.45	7,425,000
Man-power	7	56.62	210,663
Total	141	2,652.43	2,095,371,089
Compared with the year before	(de.) 3	(de.) 9.33	(de.) 61,882,400

Passenger Traffic Length of operation of passenger cars for 1932-33 totalled 346,814,853 kilometres, a drop of 2,498,918 kilometres from the year before, and that of operation of freight cars totalled 7,184,951 kilometres, a drop of 233,925 kilometres from the year before. The passenger traffic for 1933 follows:

Kinds	Passengers carried	Passenger fares	Average fare of one passenger
Electric	1,462,680,063	¥98,684,998	¥0.067
Steam	1,295,780	172,847	0.133
Gasolene	2,494,325	258,948	0.104
Horse-power	2,021,507	23,754	0.117
Man-power	1,656	219	0.132
Total	1,466,674,331	99,141,266	0.068
Compared with the year before	(de.) 99,801,558	(de.) 6,616,015	—

Freight Traffic The freight traffic for the year follows:

Kinds	Goods carried (in metric ton)	Freight receipts	Average receipt per metric ton
Electric	902,507	¥ 674,652	¥ 0.748
Steam	99,804	181,816	1.821
Gasolene	183,833	314,205	1.709
Horse-power	76,956	63,136	0.820
Man-power	93,821	68,180	0.727
Total	1,356,921	1,251,969	0.923
Compared with the year before	(de.) 126,944	(de.) 116,127	(in.) 0.001

Business Profit The business profit for 1932-33 totalled ¥41,541,733, the total business revenue being ¥109,669,986 and business expenditure ¥68,128,253. As compared with the year before, the business profit went off ¥3,105,303, or 7.5 per cent., the business revenue ¥6,210,792, or 5.7 per cent., and the business expenditure ¥3,104,989, or 4.6 per cent. Details follow:

Kinds	Business revenue (in yen)	Business expenditure (in yen)
Electric	108,548,051	67,066,647
Steam	335,570	282,558
Gasolene	608,436	611,092
Horse-power	107,792	102,676
Man-power	72,137	65,280
Total	109,669,986	68,128,253
Compared with the year before	(de.) 6,210,792	(de.) 3,104,989

Business profit was ¥41,541,733 (a drop of ¥3,105,803 from the year before), other profit ¥85,930,622 (a drop of ¥51,133,680), interest payment ¥24,853,608 (a gain of ¥3,557,784), other losses ¥9,111,339 (a drop of ¥3,533,063), net profit ¥93,507,410 (a drop of ¥25,330,330) and balance brought forward from the year before ¥38,245,503 (a gain of ¥962,262). The disposal of profit follows:

Legal reserve	¥ 4,125,540 (a drop of ¥1,326,780)
Voluntary ,,	4,665,743 (a drop of ¥ 679,384)
Bonuses	1,862,262 (a drop of ¥ 476,968)
Others	36,172,273 (a drop of ¥1,668,372)
Balance carried forward	22,184,956 (a drop of ¥2,214,577)

1934 Railway Business

State Railways The Imperial Government Railways carried 52,373,000 more passengers, loaded 6,918,680 tons more goods and earned ¥41,294,000 more in 1934 (calendar year) than they had in the previous year. Both the State and private lines had the best results in five years. The Government lines' profits tell just below those for the two-depression years of 1928 and 1929, when takings were respectively ¥506,023,000 and ¥496,979,000. State railway goods, as usual, were dominated by coal, with lumber, rice, gravel, fertilizers, charcoal, cement, iron, steel and petroleum following in that order.

December was the busiest month for hauling goods and April saw most passengers and reported the biggest monthly profit. Principal goods transported by the State Railways during 1933 and 1934 follows:

Goods	1934	1933
	(In metric tons)	
Coal	26,901,240	24,862,410
Lumber	6,903,860	5,886,040
Rice	3,343,210	2,923,860
Gravel	2,961,090	2,770,080
Minerals	2,547,090	2,081,980
Fertilizers	1,153,950	1,034,420
Cement	1,237,490	1,199,140
Iron and steel	909,580	704,220
Petroleum	693,780	559,250
Cotton yarn and cloth	589,410	527,910
Flour	331,640	328,410
Sugar	285,580	284,440
Total including others	74,934,350	67,952,770

STATE RAILWAY BUSINESS in 1934

Private Lines The eight leading private lines of the Kwanto had the best profits since 1931, their income totalling ¥21,093,000, compared with ¥20,964,000 for the year before. The eight Kwansai leaders also made more money, income jumping to ¥44,135,000, beating the 1931 mark of ¥43,726,000. April proved the best month for both the Kwanto and Kwansai private cars. April is popular because of the almost general movement of the populace into the country districts to look at the cherry blossoms. Kwanto companies showed better profit rates in both halves of 1934. There has been an increasing tendency for both Kwanto and Kwansai companies to go into sidelines. In most cases the idea is to embark upon some self-supporting business which at the same time attracts passengers. Pleasure resorts are the most common. Traction companies maintain theatres, golf links, bathing beaches, amusement parks and such enterprises. Some have combined department stores with their terminals, to draw suburban trade into the cities. Some supply electric power to the villages along their lines and have gone into real estate development directly and indirctly. Some operate bus lines as feeders to their regular services.

Tourist Industry

Three organizations, viz., the Board of Tourist Industry, the Japan Tourist Bureau (founded in 1912), and the Kokusai Kwanko Kyokai (founded in 1931), a foundation devoting itself solely to the carrying out travel publicity abroad, form the hub, from which radiate innumerable lines connecting it with other important organizations, such as the Society for International Cultural Relations and other cultural bodies, tourist associations in various districts, transportation concerns, hotels and all others that have anything to do with the tourist industry of Japan.

The Board of Tourist Industry is divided into two departments, one for general affairs and the other for business promotion. In addition to them, it has three boards of investigation dealing particularly with tourist resorts, hotel enterprises and treatment of tourists respectively. These boards comprise experts of the government and the public on the respective subjects. The Committee of Tourist Industry holds its general meeting at least once a year, when it decides what course to follow in carrying out any important undertaking.

The Kokusai Kwanko Kyokai runs an office in New York and Los Angeles, though the actual business is carried on there in the popular name of the Japan Tourist Bureau.

The branch offices of the Japan Tourist Bureau, both in Japan and abroad, number about 130 in all. Besides, it has agents in some important cities abroad in order to make the network of its service as extensive and satisfactory as possible.

Since the establishment of the Board of Tourist Industry, tourist organizations of a non-commercial basis have been successively founded in many parts of Japan, and at present the total number is in the proximity of 400.

Railways in Chosen, Taiwan, Manchuria, etc.

Chosen

The first railway enterprise in Chosen dates back to 1899, when a railway linking Keijo (Seoul) with Jinsen (Chemulpo), 29.485 kilometres in length, was laid and opened to traffic by the Kei-Jin Railway Company. The outbreak of the Russo-Japanese War caused the military authorities of Japan to build the Keijo-Fusan, Keijo-Shingishu and Masan lines which were respectively opened to traffic in 1905 and 1906. In 1906 the Imperial Government of Japan nationalized the Keijo-Fusan Line and also took over the Keijo-Shingishu and the Masan Lines from the War Office of Japan, placing all these lines under direct control of the Railway Bureau of the Korean Residency-General. Meanwhile the work of construction was steadily pushed on and in 1910 the Heijo-Chinnampo line was completed. On the spanning of the Yalu River with a swing bridge in 1911 the peninsular railway was brought into connection with the South Manchuria Railway. In 1914 the Taiden-Mokpo and Keijo-Gensan lines were completed, while in 1915 part of the

Digitized by Google

Gensan-Kwainei line was opened. In 1928 the Kankyo line which connects Kwainei to Gensan was completed, and in 1933 the Tomon line which connects Kwainei to Yuki was opened to traffic. The latter is connected with the Keito line of S. M. R. C. at Kainei, thus preparing a new eastern transportation facility between Chosen and Manchoukuo. On October 1, 1933, the total length of the State-owned lines in operation in Chosen was 3,263.9 kilometres. In 1932-33 the State Railways in Chosen conveyed 20,591,638 passengers, while the weight of goods hauled was 6,248,863 metric tons. The coaching receipts amounted to ¥18,111,091 and goods receipts to ¥20,575,819, and the total ¥38,686,904. In 1933 the number of private railway companies was 8. The aggregate length of these private railways open to traffic on March 31, 1933, was 1,139.1 kilometres.

The total length of tramways operated was 75.2 kilometres. (See Chapter XL for fuller informations.)

Taiwan

It was not until the cession of the Island of Formosa (Taiwan) from the Chinese Government to Japan that the island began to enjoy railway facilities, for, prior to that time, the only railroad existing was a small light railway between Keelung and Shinchiku built at the time of the Ching Dynasty. Soon after the cession, the Taiwan Government-General brought forward a plan, with the approval of the Diet, to build a railway connecting Takao with Keelung at the expense of ¥28,800,000. Work was started in 1889 from both termini and finished in April, 1908. This line now forms the trunk line in the island's communication system. The construction of this pioneer line was followed by other lines, that is, the Kyukyodo-Heito section completed in 1912, the Taito line in 1917 and the Giran line in 1924. On March 31, 1934 the total length of the Government lines open to traffic was 881.7 km. In 1933-34 these lines carried 17,140,859 passengers and 5,086,727 tons of goods, bringing in ¥19,331,049.

Karafuto Railway

The first railway in Karafuto (Japanese Saghalien) was constructed by the Military Department in 1906 between Otomari, formerly known as Korsakovsa, and Toyohara, formerly Vladimolocka, 41.83 km. in length. It was a light railway with a gauge of 0.61 metre and exclusively used for military purposes. With the withdrawal of the military Government in April, 1907, the railway was transferred to the control of the Karafuto Administration and opened to public traffic in August of the same year. As traffic went on increasing the gauge was widened to 1.07 metres, some time in 1910, while construction of sections further north of Toyohara was started. Late in 1911 the work on the Toyohara-Sakaehama section being completed, the Otomari-Sakaehama section, 94.13 km. which now forms the trunk line in the island's communication, was opened to traffic. Construction work has been continued since and a branch line linking the Kawakami Mine with Konuma, and the Honto-Noda section on the west coast were completed and opened to business in 1914 and 1920 respectively. In addition, the construction of a branch line which connects Toyohara, the capital of the island, with Maoka on the west coast, was started in 1921 and opened to business in 1928. In 1934 the length of the Government lines was 342.9 km. while that of private railways was 237.5 km.

Digitized by Google

South Manchuria Railway

It was on September 5, 1905, that the Japanese Government, by virtue of Article 5 of the Peace Treaty concluded between Japan and Russia, acquired possession of the railways in Manchuria from Changchun to Dalny, now Dairen, and Port Arthur, now Ryojun, together with its branch lines, all the rights, privileges, and property attaching thereto, including the local mines formerly owned by the Chinese Eastern Railway. On June 7, 1906, Imperial Ordinance No. 142 was issued concerning the establishment of the South Manchuria Railway Company and on July 13 of the same year General Viscount Gentaro Kodama was appointed chairman of the promoters' committee which were composed of 80 members. On July 25, 1906, the presidency was assumed by General Viscount Masataké Terauchi, the then Minister of War, due to the death of General Kodama. The articles of association relative to the company were prepared by the committee on the basis of the Imperial Ordinance and the instructions of the Government. They were approved by the Government on August 18 and the establishment of the company was sanctioned by the Minister of Communications on November 1, 1906. The authorized capital of the company at first was ¥200,000,000, of which ¥100,000,000 represented the total of the appraised value of railways with properties and the mines at Fushun and Yentai as handed over to the company by the Military Field Railway Department. The other half of the capitalization was offered to public subscription and the shareholders were guaranteed a 6 per cent. dividend per annum by the Japanese Government. By March, 1920, 800,000 shares representing 80 million yen were paid up, but with the development of various activities after the World War the capitalization was increased to 440 million,[1] one-half of the increased capitalization being taken up by the Japanese Government. The company is authorized to issue debentures not exceeding twice the amount of paid-up capital, and not exceeding the amount of total capitalization. The company has often issued debentures on the home and foreign markets and on such occasions both the principal and interest have been guaranteed by the Government. At the end of 1933 the authorized capital of the company was ¥800,000,000, paid-up capital ¥512,208,000; the total length of lines open to business was 1,129.1 kilometres. The gauge of these lines was 1.067 metres at first, excepting the Mukden-Antung Line. The company shortly after its establishment rebuilt the lines to the standard gauge of 1.345 metres. The doubling of track between Dairen and Changchun, 705.5 kilometres, was completed in 1915. In 1932-33 the number of passengers was 8,610,159, the tonnage of goods hauled 16,572,816 metric tons, the income from these was ¥99,834,359. (See Chapter on Manchoukuo.)

Motor Transport and Its Development

Behind Japan's motor transport system there is no such history of experimentation and endeavour as characterizes the arrival of the motor car in the West. The first car seen in Japan was one imported from America by a foreign resident of Yokohama in 1897, and then for the

Digitized by Google

next ten years there was no great increase in the number. In 1907 there were only 16 cars in the whole country. Then came a change. In 1912 there were 520 vehicles and a year later 1,000. In 1921, passenger cars numbered 4,683 and business cars numbered 7,439. The great earthquake and fire which destroyed Tokyo and Yokohama in 1923 brought about a great demand for motor cars because rail traffic was interrupted at various places and the help of motor cars was badly needed. In 1924, the number increased to 40,070, of which 27,959 were passenger cars and 12,097 were trucks. The rate of increase for the five years 1921-26 was for passenger cars 100.49 per cent. and for trucks 1,200.6 per cent. This rapid development of motor car transport has driven rikishas, electric cars and provincial railways into the background. Motor car passengers are increasing year after year, while passenger receipts on provincial railways are quickly decreasing. To the present, except in the vicinity of large cities, Japan has not been blessed with good roads, but the construction of first-class motor roads is being pushed ahead in all parts of the country and traffic is bound to make a phenomenal increase as the roads are completed.

Number of Cars The most recent figure on the number of cars in the Empire was taken by the National Resource Bureau of the Cabinet toward the close of 1933. According to this, the number was 106,788, including those cars in the territories. According to the investigation of the same Bureau the total number of motor cars at the end of October 1934, was 121,192.

NUMBER OF CARS

1933 and 1934

	Passenger Cars		Trucks		Special cars		Total
	Japan proper	Colonies	Japan proper	Colonies	Japan proper	Colonies	
1933	61,691	6,528	33,177	2,938	2,032	422	106,788
1934	68,746	7,378	38,346	3,991	2,142	589	121,192

Number of Cars in Principal Prefectures in 1934

	Passenger cars	Trucks	Special cars	Total
Tokyo	17,443	8,583	381	26,407
Osaka	5,034	2,965	165	8,164
Hyogo	2,695	1,475	85	4,255
Kanagawa	3,091	1,842	86	5,019
Aichi	2,852	1,968	62	4,882
Shizuoka	2,267	1,455	95	3,817
Fukuoka	2,462	805	100	3,367
Kyoto	2,492	1,083	58	3,633

Tokyo prefecture had the most and next came Osaka, Kanagawa, Aichi, Hyogo Shizuoka, Kyoto, and Fukuoka prefectures in the order named.

Commercial Passenger Cars Although the available figures are old, the business mileage of commercial passenger motor vehicles by fixed lines at the end of 1930 totalled 122,284 kilometres. If the business mileage of motor trucks by fixed lines be added, the total amounts to more than 160,900 kilometres. There were many cases of duplication of services by competitive lines, but if the actual business mileage is estimated as being one-third of the above total, it will be found that it was more than double that of the

Digitized by Google

Government-owned and private railway and tramcar services combined. The total number of companies and individuals engaged in bus business in 1933 reached 3,491. Among prefectures Fukuoka led with 219. The other prefectures which had over 100 were as follows: Kumamoto 198, Fukushima 197, Hokkaido 133, Oita 122, Kagoshima 107 Saga 100, Akita 100, and Nagasaki 100. These figures do not necessarily represent the prosperity or better facilities for motor transportation in the districts, but in many cases simply indicate the absence of any effective control of the business. The worst instance of the case is a load in Kumamoto where 10 buses are running.

The Ministry of Railways is going to control over such disorder or competition according to the Motor Transportation Business Law promulgated in 1934.

The prefectures which had geographical and geological handicaps had smaller numbers such as Okinawa 12, Tottori 27, Nara 28, Fukui 28, and Kochi 30. The prefectures in which the six big cities are located had comparatively small numbers indicative of a good control, i. e. Tokyo 71, Hyogo 80, Kanagawa 60, Osaka 42, Aichi 83 and Kyoto 62.

(As to the production and supply of motor cars in Japan see Chapter XIX.)

Motor Cycles The number of motor cycles in all Japan at the end of 1914 was 111, which became 265 in 1919, 332 in 1920, 424 in 1921, 519 in 1922, 609 in 1923, 516 in 1924, 962 in 1925, 852 in 1926, 1,008 in 1927, 1,119 in 1928, 1,477 in 1929, 2,213 in 1930, 2,888 in 1931, 3,439 in 1932 and 10,011 on October 31, 1934.

Automobiles Imported

Japan's imports of automobiles and parts are mostly from America. The largest total imports were ¥34,903,822 in 1930. Imports since 1918 have been as follows:

(In ¥1,000)

Year	Value
1918	7,661
1919	11,228
1920	10,478
1921	8,067
1922	7,309
1923	18,482
1924	21,186
1925	11,682
1926	15,722
1927	18,281
1928	32,244
1929	33,608
1930	20,778
1931	16,329
1932	14,821
1933	14,382
1934	32,813

American Cars Used America dominates the Japanese motor car trade, supplying 90 per cent. of the total. At the end of 1927 there were approximately 54,000 motor vehicles in this country, principally of American manufacture. The Ford Motor Company, Yokohama, assembles materials imported from America and sells its products in the Japanese market. General Motors, Osaka, works on the same principles. Sales are well distributed over the utility range, with commercial vehicles in the lead. The growth of the one-yen taxi business brought a strong demand for cheap passenger cars, notably Fords, Chevrolets and Whippets among the Americans, Citroens among the French and Morris cars among the British. One-yen taxi concerns have been formed in all the leading cities of Japan. These concerns rent the cabs to drivers who pay, in addition to the rent, for the gasolene consumed. So great has been the success of the one-yen system that the metred taxicabs have all but disappeared from Japan. Moreover, there has been a considerable change in the type of car used. Cheap cars are

Digitized by Google

principally in evidence, although some second-hand machines, hand-me-downs of the older companies, are to be found.

Tractors Tractors have not found a large market in Japan. Those bought have found their way into industrial fields, for the farms of Japan are small and comparatively few tractors can be utilized in agricultural work, though forestry has found a use for several. About 1,000 are now in use throughout the country.

Aviation

History of Development

The Early Period During the Satsuma Rebellion in 1877, two balloons were built. In 1891, Mr. Chuhachi Ninomiya made a model of an aeroplane shaped like a bird from his own design, and, in 1894, another shaped like an insect. In 1897, Mr. Isaburo Yamada obtained a patent for a kite balloon of his own invention. Two of these kite balloons were used in the siege of Port Arthur during the Russo-Japanese War. In 1907, a balloon corps was organized in the Telegraph Corps at Nakano, and, in June, 1909, a special military balloon investigation association was established. In March, 1910, a gliding test of aeroplane No. 1 of the Hino type was made at Toyamagahara, Tokyo, and, in October that year, a flying test of an aeroplane of the Narahara type was made. On December 19 of the same year, Lieutenant Tokugawa (now Major-General) flew 3,000 metres in four minutes in a Farman aeroplane at Yoyogi, and Captain Hino flew in a Glady aeroplane. This was the first time that an aeroplane flight was carried out in Japan.

The First Civilian Flight In the spring of 1911, airship No. 2 of the Yamada type was taken out of the hangar at Osaki, Tokyo, and made a successful cross-country flight. In March and April of the same year, an American flyer carried out an exhibition flight in Osaka and Tokyo; on April 8, Mr. Shinzo Morita, who had studied flying in France, flew in a 45 h.p. monoplane over the Joto parade-ground in Osaka, this being the first flight by a civilian flyer in this country; and, in April that year, the aerodrome and flying ground at Tokorozawa were completed. In June, 1912, Mr. Atwater, an American flyer, conducted a series of exhibition flights by hydroplane on the sea off Nishinomiya near Osaka; and, in July that year, five officers were selected from each army division to be trained as flying officers. This marks the beginning of instruction in flying to military officers in this country. In the autumn of 1912, a number of aeroplanes and airships participated in the grand military manœuvres. In February, 1913, the Teikoku Hiko Kyokai (Imperial Aeronautical Association) was established; on May 4 that year, Mr. Koha Takeishi, a civilian flyer, started on a Naruo-Osaka-Kyoto flight, but, when landing in the Fukakusa parade-ground in Kyoto, he met with disaster and died as the first victim of civilian aviation in Japan.

Contest of Civilian Aviators In 1914, a contest by civilian aviators was held at Naruo, near Osaka, under the auspices of the Imperial Aeronautical Association, and, during the Tsingtao campaign Japanese military aeroplanes took part in actual fighting for the first time and displayed their ability in scouting, in bombing the enemy fortress and in an aerial com-

Digitized by Google

bat with enemy planes. In 1915, a meet of civilian flyers was held in Osaka, and a military flying battalion was formed. Between January and April, 1916, American aviators visited Japan and performed trick flying at Naruo and other places; and, on April 27 that year, night flying was successfully carried out for the first time in this country. In 1917, the flying battalion was enlarged into the first and second battalions and a balloon corps. In April that year, Mr. Bird Smith, an American flyer, again visited Japan and carried out a series of high-class exhibition flights in Osaka and Tokyo. In April, 1918, Mr. Masao Goto, a private flyer, succeeded in making a non-stop flight between Tokorozawa and Osaka for the first time.

Military Flying School In April, 1919, the Military Aeronautical Department and the Military Flying School were established; and, on October 22 that year, the first mail transport flight between Tokyo and Osaka was carried out with success. In 1920, the Aeronautical Institute was established at Tsukishima, Tokyo; and, in May that year, two Italian aviators paid a visit to Japan by air. In March, 1921, the regulations for the control of aviation were put in force. In the autumn of 1922, the Japan Aerial Transport Institute started a regular flying service between Sakai and Shikoku by hydroplanes. In 1923, the military air force was made an independent arm. The Osaka Asahi Shimbun started a regular air service between Tokyo and Osaka in January and the Japan Aerial Navigation Co., Ltd., one between Osaka and Beppu in July that year. In March, 1924, the dirigible S. S. No. 3 exploded and, in September that year, the trial flight of the newly built airship Astra was carried out.

Air Mail Traffic In April, 1925, air mail traffic was started between Tokyo and Osaka; and, on July 25 that year, an aeroplane of the Asahi Shimbun took off from the Yoyogi parade ground in Tokyo and, on October 27, reached Rome after a flight of 16,000 kilometres (in stages) via Moscow, Paris and London. In 1926, the Japanese Navy purchased from Italy the dirigible S-No. 3, which was one with a semi-rigid envelope, introduced into Japan for the first time. In June, 1927, the Aviation Law came into effect. In May, the Coast Defence Association successfully carried out a flight round the mainland, and, in October that year, the airship S-No. 3 exploded, while participating in the grand naval manœuvres. In April, 1928, Mr. Habuto, a civilian aviator, established a new record by flying 2,000 kilometres in 13 hours and 23 minutes; and, in July that year, aerial defence manœuvres were conducted in Osaka.

The Air Transport Co. In 1929, the Japan Air Transport Co., Ltd., was established and inaugurated a regular air passenger carrying service between Tokyo, Osaka and Fukuoka, later extending it to Seoul and Dairen; and two Army scouting planes of the 88 type flew between Tachiarai and Heito without stopping, making a record of aerial connection between the mainland and Taiwan. On their homeward flight, one of the planes flew for 15 hours and 15 minutes, thus establishing a new record of staying in the air in this country. In 1930, the Japan Students' Aviation League was formed and associations for the study of aviation were established one after another in different universities and colleges in Tokyo and Osaka. Mr. Yoshihara, a civilian flyer, flew from Berlin to Tokyo via Siberia in 11 days and simultaneously, Mr Azuma, also a civilian flyer, reached Tokyo

Digitized by Google

from Los Angeles via New York, London, Berlin and Siberia. In March, 1931, the airship No. 8 which had been made in Japan and belonged to the naval air force at Kasumigaura took off and stayed in the air for a record length of time of 60 hours and one minute.

The Aeronautical Institute In May, the Aeronautical Institute which ranks as the best research station in the world was completed six years after the starting of its construction. In the same month, the aeroplane "Young Japan" belonging to Hosei University, a member of the Students' Aviation League, set off for Europe from the flying ground at Haneda near Tokyo and, at the end of August, reached its destination, Rome. After the outbreak of the Manchurian trouble in September that year, our military planes participated in actual warfare for the first time since the Tsingtao campaign. In October of the same year, the aeroplane (Fokker No. 3-M) of the Japan Air Transport Company succeeded in flying between Taiwan and the mainland. In 1932, as a consequence of the Manchurian trouble, 64 "Aikoku" (Patriotic) planes were constructed with money contributed by the people generally, and, moreover, defence from aerial attack became much discussed in our principal cities and important economic centres. On February 23, our Navy planes fought with enemy planes in the air over Shanghai. In the fighting, Lieutenant Kotani was killed, while Lieutenant Ikuta shot down a Boeing plane of the enemy. The trial night flights between Tokyo and Tachiarai on the nights of April 20 and May 2 that year proved a success.

Present Condition of Civil Aviation

Modest but definite progress of commercial aviation in Japan is indicated in the annual report of the Japan Air Transport Company, which reports mails carried by the company's planes during the year 1934 totalled 1,268,435, recording almost a 50 per cent. increase over the 647,601 of the previous year. Commencing with April 1, 1935, the company has resumed night flying and also has inaugurated a special early morning service bringing Mukden within a day's reach from Tokyo by way of Seoul and Dairen. The early morning service will be extended to Hsinking, the capital of Manchoukuo, on May 1. Further expansion of commercial aviation is expected to be facilitated considerably by the 15-year Government subsidy plan adopted by the Communications Ministry last year with a tentative budget of ¥200,000,000 for the whole period and originally a sum of ¥5,500,000 for the 1935-36 year but later cut to a smaller amount. During the last fiscal year the Japan Air Transport Company maintained the longest route of service totaling 2,118 kilometres between Tokyo and Dairen by way of Nagoya, Osaka, Fukuoka, Urusan, Seoul, Heijo and Shingishu. Of the other aviation concerns Japan Aviation Research Institute maintains a 290-kilometre service between Osaka and Matsuyama in Shikoku, by way of Takamatsu; the Tokyo Air Transport Company a 150-kilometre service between Tokyo and Shimoda; the Tokyo Asahi Shimbunsha, Ltd., a 415-kilometre service between Tokyo and Niigata; and the Japan Marine Air Transport Company a newly opened service between Matsue, Shimane Prefecture, and Hirosaki on th Japan Sea coast. The Tokyo-Shimoda service is operated only between May and September and the Tokyo-Niigata service between May and October. In 1934 the total

Digitized by Google

distance of commercial air routes in Japan was 3,751 kilometres.

Except the Japan Air Transport Company, which has a paid-up capitalization of ¥4,000,000 all Japanese commercial aviation firms are still operated on extremely limited scale, while even Japan Air Transport is assisted by an annual Government subsidy of ¥500,000. The operation of a commercial aviation concern in this country is still impossible without liberal monetary help from the State.

Japan at present has a total of only 152 civil airplanes, of which 34 are in use for regular air services. The Japan Air Transport Company has begun to witness a gradually sinking business since recently with a decrease of Government subsidy. It opened to business in April, 1929, and since its operation to service the company has contributed a great deal to the development of civil aviation in Japan. However, the results have not proved satisfactory, especially with recent years. Its profit rate was dropped considerably of late. Its business results since the opening of business follow :

	Paid-up capital (¥1,000)	Profit	Profit rate (In per cent)	Annual Dividend rate
1st h. 1929	2,500	355	28	5
2nd h. 1929	2,500	622	49.8	6
1st h. 1930	2,500	887	71.0	6
2nd h. 1930	3,955	1,033	52.2	6
1st h. 1931	4,000	979	49.0	6
2nd h. 1931	4,000	390	42.3	6
1st h. 1932	4,000	939	47.0	6
2nd h. 1932	4,000	924	46.0	6
1st h. 1933	4,000	844	42.2	6
2nd h. 1933	4,000	274	13.7	5
1st h. 1934	4,000	379	19.0	5
2nd h. 1934	4,000	254	12.7	5
1st h. 1935	4,000	189	9.5	5

The company will be given subsidy totalling ¥19,970,000 spreading over 11 years after its founding. For the first five years especially three years following its founding the subsidy was larger, but since then the amount has been decreasing. In the third year the subsidy totalled ¥3,580,000, but in the 10th year it will come down to ¥770,000 and in the last year it will be reduced to ¥120,000. The company opened aviation service between Tokyo and Toyama. The service to Formosa will start in January, 1936. The Fukuoka-Shanghai service is on the programme, but this depends on the improvement of Sino-Japanese relations.

REGULAR AIR SERVICE ROUTES IN JAPAN

Route	Distance (in kilometres)	Time required for flying	Carrying	Company or body operating route	No. of flights

Route	Distance (in kilometres)	Time required for flying	Carrying	Company or body operating route	No. of flights
Tokyo-Shimoda	150	55 m.	Passengers and freight	Tokyo Air Transport Co.	Once (both ways) on Monday, Wednesday and Friday each week
Ito-Shimoda	45	25 m.	,,	,,	,,
Shimoda-Numazu	74	35 m.	,,	,,	,,
Numazu-Shimizu	36	20 m.	,,	,,	,,
Tokyo-Niigata	380	2 h. 30 m.	Freight and mail	Asahi Regular Air Service Ass'n	Three times (both ways) each week in summer

Remarks: Except on the Dairen-Shinwiju route of the Japan Air Transport Company, considerable reductions are made for the through rates both for passengers and goods that are carried beyond one fixed section between Dairen and other places.

Flying Grounds

Public and private flying grounds in Japan are as follows:

Public Grounds The Tokyo Airport. The Tokyo flying ground is situated at Suzuki-Shinden, Haneda-machi, Tokyo prefecture (Long. 139° 40′ E. and Lat. 35° 30′ N.). It is a flying ground on land and covers an area of 528,926 square metres. Its runway extends for 600 metres from east to west and as much from north to south. It slopes at a gradient of 1/500 and is divided into 330,000 square metres of exposed land, 198,000 square metres of grass land and 33,000 square metres of concrete paved zone. The usual direction of wind there is from south to north. In the grounds, there are a signal pole, a weighing beam, a compass correction stand, and a factory.

The Osaka Airport. The Osaka flying ground is situated at Kizugawajiri, Funa-machi, Minato-ku, Osaka (Long. 135° 23′ E. and Lat. 34° 39′ N.). It is a flying ground both on land and water in category and covers an area of approximately 350,000 square metres. Its runway extends for 720 metres from east to north and 400 metres from north to south. The ground inclines in a minor degree from north to south and is overgrown with clover. The gliding range for hydroplanes is the sea outside Osaka harbour. The direction of wind there is generally from east to west. Chief provisions in the ground are a signal-pole, two tower-cranes, and a compass correction stand.

The Fukuoka Flying Ground. The Fukuoka flying ground is situated at Najima, Tadara-mura, Kasuya-gun, Fukuoka prefecture (Long. 130° 26′ E. and Lat. 33° 39′ N.). It is a flying ground for hydroplanes and its gliding range extends over the eastern part of Fukuoka Bay. The direction of wind there is generally from south to north. It is provided with a signal-pole, a crane, a weighing beam for hydroplanes, a compass correction stand, a gliding incline, an anchorage, etc.

The Urusan Flying Ground. The Urusan flying ground is situated at Urusan, Urusan-gun, Keisho-Nando (South Kyongsang-do), Chosen. It is a flying ground on land and its runway extends for 600 metres from east to west and for the same distance from north to south.

Digitized by Google

The Keijo Flying Ground. The Keijo flying ground is situated at Nyoito, Ryukomen, Koyo-gun, Keikido (Kyongki-do), Chosen. It is a flying ground on land and its runway extends for 600 metres from east to west and for the same distance from north to south.

The Dairen Flying Ground. The Dairen flying ground is situated at Choushuitzu, Kwantung Province. It is a flying ground on land and its runway forms a circle with a 600-metre diameter.

Private Grounds The Nakajima Aeroplane Works. This flying ground is situated at Minami-Hamakawa, Oi-machi, Yebara-ku, Tokyo, and is for use by hydroplanes.

The Hokkai Times Ground. The Hokkai Times flying ground is situated at Kita Nijushijo and Nijugojo, Sapporo. It is a flying ground on land and its runway extends for 190 metres from east to west and 360 metres from north to south.

The Kawanishi Aeroplane Co. This flying ground is situated at Naruo-mura, Muko-gun, Hyogo prefecture, and is for use by hydroplanes. Its gliding range is on the sea off No. 1, Ohigashi, Naruo, Naruo-mura.

Aeronautical Wireless Stations

The following wireless stations exist with the special object of supplying aeroplanes flying the Tokyo- Dairen and the Osaka-Shanghai routes with weather reports and also of reporting their arrival and departure :

Name	Call signal	Site
Tokyo Wireless Station	JXS	Otemachi Nichomé, Kojimachi-ku, Tokyo.
Hakoné „ „	JXH	Segyodaira, Mishima-machi, Takata-gun, Shizuoka prefecture.
Kameyama „	JXK	Ochizaki, Kameda, Kameyama-machi, Suzuga-gun, Miyé prefecture.
Osaka „ „	JXO	Dojima Nichomé, Kita-ku, Osaka.
Fukuoka „ „	JXF	Najima, Tadara-mura, Kasuya-gun, Fukuoka prefecture.
Itsuhara „ „	JXI	Itsuhara-machi, Shimokata-gun Nagano prefecture.
Tomiyé „ „	JXY	Minami Tomiyé-mura, Matsuura-gun, Nagasaki prefecture.
Urusan „ „	JXM	Hokumen-Dotei, Urusan, Urusangun, Keisho-Nando (South Kyongsang-do), Chosen.
Keijo „ „	JBB	Hommachi Itchomé, Keijo (Seoul), Keikido (Kyonkido) Chosen.

Land Marks for Aviators

In order to secure the safety of aerial navigation, the following places are marked with their names in large white "Kana" letters :

Mark	Place
Numazu	Tsuruta, O-oka-mura, Sunto-gun, Shizuoka prefecture.
Hamamatsu	Matakogawa, Tomizuka-mura, Hamana-gun, Shizuoka prefecture.
Kameyama	Nomura, Kameyama-machi, Suzuka-gun, Miyé prefecture.
Shōdoshima	Shikai-mura, Azuki-gun, Kagawa prefecture.
Imabari	Ohama, Chikami-mura, Koshichi-gun, Ehimé prefecture.
Murozumi	Aburada, Murozumi-machi, Kumaké-gun, Yamaguchi prefecture.
Nakatsu	Tsunoki, Nakatsu-machi Shimoké-gun, Oita prefecture.
Yukuhashi	Yukibashi, Yukibashi-machi, Kyoto-gun, Fukuoka prefecture.
Urusan	Sansanri, Urusanmen, Urusan-gun, Keisho-Nando (South Kyongsang-do), Chosen.
Kwokan	Nasanri, Kwokanmen, Yeido-gun, Chusei Hokudo (North Choongchong-do), Chosen.

Digitized by Google

Taidén	Kudori, Gainamen, Taidén-gun, Chusei Nando (South Choongchong-do), Chosen.
Ten-an	Seiseiri, Ten-anmen, Ten-an-gun, Chusei Nando (South Choong-chong-do), Chosen.
Shariin	Tetsuzanri, Shriinmen, Hozan-gun, Kwokai-do (Whanghai-do), Chosen.
Heijo (Pyongyang)	Jinkori, Seisenmen, Daido-gun, Heian Nando (South Pyong-an-do), Chosen.
Teishu	Jogaido, Teishumen, Teishu-gun, Heian Hokudo (North Pyong-an-do), Chosen.
Shingishu	Mirokudo, Kojomen, Gishu-gun, Heian Hokudo (North Pyong-an-do), Chosen.
Pitzuwo	Pitzuwo, Kwantung Province.

Civilian Aeroplanes Civilian aeroplanes on October 31, 1934, for which certificates of airworthiness and registry certificates have been granted, are as follows:

Classification	Description	Number	Total number
Free from all restrictions	Aeroplanes	17	17
	Hydroplanes		
Not qualified for trick flying	Aeroplanes	122	140
	Hydroplanes	18	
Total	Aeroplanes	136	157
	Hydroplanes	21	

Note: 50 planes were damaged by the typhoon of September 21, 1934.

Civilian Aviators in Japan Licensed Japanese civilian aviators on October 31, 1934, are as follows:

Classification	1st class	2nd class	3rd class	Total
Aeroplane and hydroplane pilots	226	307	89	622
Navigators	19	203	—	222
Mechanics	—	—	—	78
Dirigible balloon pilots	—	—	—	2

Aerial Lighthouses According to the first plan of the Department of Communications 19 aerial lighthouses will be established along the Tokyo-Osaka route and the same number along the Osaka-Fukuoka line. For the former the four larger ones, at Hakoné (Shizuoka prefecture), Yaizu (Shizuoka), Chita (Aichi) and Ikoma (Nara) are already erected. This has been changed and 20 lighthouses have been erected between Tokyo and Osaka. The erection of the same number of aerial lighthouses between Osaka and Fukuoka is also comtemplated. In the following list those under the heading Tokyo and Osaka have already been erected, while those between Osaka and Fukuoka will be erected:

Tokyo-Osaka Place	Prefecture
Totsuka	Kanagawa
Hiratsuka	,,
Manazuru	,,
Jikkoku	Shizuoka

Organizations connected with Aviation

The Aviation Council This body is under the direct control of the Minister of Education and returns reports on matters submitted by him; it also deliberates on important matters concerning the study of the basic theories of flying-machines and makes recommendations to the Cabinet Ministers concerned. It is composed of a president and 20 councillors, and, in case of particular need, councillors ad interim are appointed. The councillors are the Vice-Ministers of the Departments of War, Marine, Education, and Communications, as well as those who have deep knowledge and wide experience, while the councillors ad interim are selected from among scholars and experts.

The Imperial Aeronautical Association The Imperial Aeronautical Association was established in 1913 with the object of encouraging and protecting the development of science and art pertaining to aviation and of flying machines and their parts and accessories as well as diffusing knowledge of, and cultivating taste for, aerial flight among the people. A sum of ¥500,000 granted from the Privy Purse was made a foundation-fund, and, with interest accruing from it and with receipts from dues paid by its members (¥2.00 per member), the Association carries on its undertaking, the principal items of which are presenting persons who fall victims to aviation and accidents connected thereto with condolence money, awarding bounties to persons connected with aviation, and giving lectures, cinema shows, and exhibitions concerning aviation. It also publishes a monthly journal containing aviation news at home and abroad. It has an Imperial Prince as patron and a board of directors of 30 members, including a president, two vice-presidents, and a managing-director. In addition, it has five auditors and over 105 councillors, from whom directors are elected. Its offices are located at No. 7, Sakurada Hongo-cho, Shiba-ku, Tokyo.

The International Aviation Commission This Commission is a permanent organ created in accordance with the provisions of the Treaty relating to Aviation, and makes or receives proposals bearing on alterations and modifications of the provisions of the treaty to and from the signatory Powers, and reports to them such alterations and modifications as are adopted.

The International Aviation Federation This Federation consists of various corporations relating to aviation in different countries and chiefly aims at the progress of civil aviation through mutual consultation and also the promotion of mutual facilities. Besides, it undertakes recognition of world flying records. The Imperial Aeronautical Association represents Japan in the Federation.

The Aeronautical Institute The Aeronautical Institute was first established at Etchujima in Tokyo in

Digitized by Google

April, 1918 by taking over the business of the Commission on Investigation of Aeronautics organized in the Tokyo Imperial University in April, 1916, with the object of making researches in aeroplanes, airships, balloons, motors, aviation psychology and other matters concerning aviation. Subsequently, in the earthquake and fire of 1923, the institute was destroyed and was newly constructed at Komaba in the grounds of the Department of Agriculture of the Tokyo Imperial University in 1927. It is divided into the departments of air pockets, aeroplanes, physics, chemistry, metallurgy and material, and ranks first in the world in point of equipment. The present president is Baron Chuzaburo Shiba, Doctor of Science and Professor at the Tokyo Imperial University.

Training Institutes Below are lists of institutes established for the training of aviators:

CHAPTER XXVI

SEA TRANSPORTATION

Historical Background

The dawn of Japan's history is associated with marine activities. The national mythology is rich in stories of sea adventures. Later authentic records fully demonstrate the energy and spirit of the early Japanese, who had to fight their way through stormy seas in the primitive craft of those days. The period covered by the latter half of the sixteenth century and the beginning of the seventeenth century marks the golden age of marine activity of Old Japan. This was in a great measure due to the stimulus received by the Japanese through the appearance of Portuguese and other foreign ships in Japanese waters. Japanese vessels not only were in evidence in South China and the South Sea Islands, but cruised the Pacific as far as Mexico and fought their way through the Indian Ocean and the Cape of Good Hope to Europe. Military rulers encouraged maritime enterprises and numerous large vessels were built. Thus, the shipping trade between Japan and the South Seas and India, carried on under letters patent and numbering no less than two hundred ships at one time, engaged in commerce with twenty different countries, which were eventually dotted with regular Japanese colonies.

Ban on Shipping Activities Unfortunately, while the maritime prosperity of Japan was thus making progress by leaps and bounds, the Tokugawa Shogunate took the drastic measure of secluding the country and forbidding all foreign intercourse. Its first act was to place a strict ban on the propagation of Christianity in 1613. Subsequently, in 1634, all commercial relations with foreign countries were stopped, and in 1636 the construction of large ocean-going vessels was forbidden. For a long period of more than two centuries thereafter, the ocean trade of Japan was held in a state of forced suspension.

The Well-timed Visit The Commodore's visit in 1853 was well timed, inasmuch as by this time many Japanese amongst the intelligent class were dimly aware of the conditions outside Japan, and the Shogun's Government amid the confusion of opinion took a firm step and signed the treaty. This event was followed in 1854 by the conclusion of similar treaties with leading nations of Europe. Commercial intercourse with foreign countries was thus resumed, and the time-worn restrictions on navigation and ship-building were withdrawn. Then was formed the nucleus of the present mercantile marine of Japan. The Shogun's Government, finding the old Japanese systems of ship-building and navigation utterly out-of-date, promptly decided upon introducing the ideas of the outside world. For this purpose, students were sent abroad, while foreign experts were engaged to work in Japan. A ship-building yard was established in Yokosuka, and a naval school in Nagasaki.

After the Meiji Restoration

The First Steamship Co. In the third year of Meiji the Government promulgated the Mercantile Marine

Digitized by Google

Regulations. In the same year, the pioneer steamship concern was inaugurated and a new leaf in the history of the Japanese mercantile marine was turned. The first company to be incorporated was the Kwaiso Kaisha, or Forwarding and Transport Company, which was later re-named the Teikoku Yusen Joki Kaisha (Imperial Mail Steamship Co.). Mampei Kimura was one of the chief promoters. A regular service was maintained between Tokyo and Yokohama and between Osaka and Kobé. Yataro Iwasaki, founder of the Mitsubishi interests, incorporated a shipping company called Kutsumo Shokai, later re-named the Mitsubishi Shokai in 1870 and inaugurated a regular passenger service between Tokyo and Kochi in Shikoku, from which Iwasaki hailed. Three steamers formerly owned by Lord Yamanouchi, former feudal lord of Tosa, were employed in the service. When the Japanese Government sent a punitive force against Formosa in 1874, all foreign steamship companies interested in the Far Eastern shipping trade declared neutrality and rejected the Government's offer to charter their ships. Perplexed at this, the Government ordered the Mitsubishi Shokai and Teikoku Joki to offer their ships, and thus the transportation of troops was smoothly effected.

The N. Y. K. Comes into Existence Shigenobu Okuma, then Minister of Finance, and Toshimichi Okubo, then Home Minister, made efforts to organize the Yubin Kisen Mitsubishi Kaisha after the termination of the expedition. The above two firms were dissolved and the Government's ships were handed over to the new company. The Mitsubishi interests made large profits under Government protection. Kaoru Inouyé and Admiral Tsugumichi Saigo, who were Okuma's political opponents, organized a corporation to rival the Mitsubishi's as a means of overthrowing Okuma and ordered, in 1882, Eiichi Shibusawa, Takashi Masuda and others to form a semi-Government shipping company under the name of the Kyodo Unyu Kaisha. Keen competition later ensued between the two and threatened to lead them to ruin. Consequently, the Government ordered them to effect a merger. In 1885 the Nippon Yusen Kaisha was incorporated through the investment of ¥5,000,000 by the Mitsubishi and ¥6,000,000 by the Kyodo Unyu. At the time of founding, the company owned 58 steamers with an aggregate of 68,700 tons. The Pacific Mail Steamship Company of America was then operating a regular line between Yokohama and Shanghai with the s. s. Golden Age, the Costa Rico and two other ships, all of which were purchased by the Japanese Government in 1874 for the transportation of Japanese soldiers on the expedition to Formosa. Iwasaki waged a freight war with the Pacific Mail at that time and finally purchased these four ships for $8,000,000. This price included the Shanghai wharf now owned by the Nippon Yusen Kaisha at Whampoo.

The O. S. K. About this time the Osaka Shosen Kaisha was established in Osaka. It was then a small concern maintaining services in the Inland Sea of Japan, but later developed into a large company. The Nippon Yusen Kaisha, while maintaining the services originally inaugurated by its predecessors, opened new lines to Korea and North China, and one between Shanghai and Vladivostok; and in 1891, it inaugurated the service between Kobé and Manila and commenced to despatch occasional ships to Australia. In 1892, the N. Y. K. Japan-Bombay service was opened, the

Digitized by Google

first regular Japanese steamship service with a far away foreign country. The rapid progress of Japanese shipping can be proved by the fact that in the beginning of 1891 the total tonnage owned in Japan was 100,000, and this figure was increased by 10,000, tons in the following year.

The Sino-Japanese War During the Sino-Japanese War of 1894-5, when the greater part of Japanese space was requisitioned for transport purposes, a large number of steamers was purchased by Japanese owners and many others were chartered by them, and Japan, having complete command of the sea, was able to maintain its established oversea services. At the close of the war, Japan found its merchant marine had grown by 100 per cent. compared with the figures of before the war. Meanwhile, the Nippon Yusen Kaisha lost no time in consolidating its established lines and in 1896 it inaugurated three trunk lines, viz., the Yokohama-London-Antwerp line, the Hongkong-Japan-Seattle line and the Yokohama-Manila-Australia line. In 1898 the Toyo Kisen Kaisha was established, and it maintained a few regular fast service between Hongkong and San Francisco via Japanese ports with three fine new passenger boats. The Osaka Shosen Kaisha opened a new line on the Yangtzekiang in 1898. In the following year, this company opened a line from Formosa to Hongkong, via Amoy and Swatow. The increase in Japanese tonnage at that time was remarkable. Whereas, at the end of 1897 it amounted to only 270,000 tons, it suddenly increased at the end of 1898, to 477,000 tons, the ratio of growth continuing, until the gross tonnage of steamers of 1,000 tons and over at the end of 1903 amounted to 521,000.

Foreigners' Services Mention must not be omitted of the valuable contribution made by foreign experts to the development of the Japanese mercantile marine. Through the remarkable foresight of Iwasaki, not only foreign captains, officers, engineers and pursers were freely engaged afloat, but numerous experts, business and technical, were employed on shore to conduct the business of the Nippon Yusen Kaisha. A large number of these foreigners remained in the company's service for a considerable time after its formation. Foremost among them were A. R. Brown, Alexander Macmillan, T. H. James, J. W. Ekstrand, W. H. Hasewell, Hector Frazer, etc., whose names are still familiar to old timers in the Far Eastern shipping trade.

One noteworthy fact in connection with the development of the shipping business is the advance made by Japanese mariners. Japan imported the science of navigation from the West and early in the Meiji Era, captains, chief engineers and mates were mostly foreigners. When the Nippon Yusen Kaisha was first organized in 1884, the company owned 57 steamers with a total tonnage of 60,000 and employed about 174 foreigners, the number being increased to 224 during the Sino-Japanese War. During the Russo-Japanese War, Japanese mariners were centres of praise, and their credit was greatly raised. After the war, in 1907, the number of foreigners was reduced to 87 and in 1920 there was not a single foreigner in a Japanese ship.

The Russo-Japanese War The Russo-Japanese War broke out early in 1904, and Japan found itself compelled to undertake transport work of the biggest magnitude ever known in its history. This situation naturally created the necessity of purchasing additional tonnage, with the result that at the end of 1906 the

Digitized by Google

total merchant marine reached a little more than one million gross tons, and Japan thus ranked sixth among the great maritime Powers of the world. Through the expansion of trade after the war, sufficient employment was found for these steamers. The Toyo Kisen Kaisha opened its South American service before the war terminated. The Osaka Shosen Kaisha started in 1909 its Far East—Puget Sound service. Elsewhere, the expansion was also pronounced, for in 1907 four large Japanese companies trading on the Yangtze-kiang pooled their interests and formed the Nisshin Kisen Kaisha (Japan-China Steamship Company) and the Osaka Shosen Kaisha in the meantime inaugurated the Tsuruga-Vladivostok and the Osaka-Kobé-Moji-Dairen lines. The general slump in the shipping trade which prevailed all over the world during this period was felt in Japan, but the country was not so badly hit as to prevent its further growth, for, at the end of the year when the World War broke out, the total gross tonnage of ships flying the Japanese flag was 1,590,000, of which 1,310,000 tons represented ships of more than 1,000 gross tons each. Turning to the share which Japanese merchant shipping contributed to its foreign commerce, it was found that, whereas, prior to the Sino-Japanese war (1894-5), only 10 per cent. of imports and exports were carried by Japanese ships, the proportion increased to 40 per cent. after the Russo-Japanese War (1904-5), and just before the commencement of the World War, it was further augmented to 48 per cent.

The World War An extensive dearth of tonnage and the consequent pressing demand for space all over the world, caused by the World War, created a unique situation for Japanese merchant shipping, so much so that the total gross tonnage suddenly swelled by a million tons within a brief period and the yearly shipbuilding capacity increased from 50,000 tons to a half million gross tons. The share contributed by Japanese vessels to the transportation of imports and exports increased to nearly 80 per cent., the remaining 20 per cent. being carried by foreign ships. Many new shipping services to all corners of the globe were opened one after another, and besides rendering distinguished service to the cause of the Allies, the Japanese mercantile marine maintained a regular fortnightly Japan-England mail service, and despatched extra ships to European waters during the war. Further more, in response to the call of the United States after that country participated in the War a group of Japanese shipowners delivered a number of steamers aggregating 150,000 tons to the United States Government on charter at rates considerably lower than those which shipowners at that time could have obtained in the open market.

The inevitable aftermath of the war abnormalities—shipping depression—set in early in 1920, and this is still being felt all over the world. Japanese shipping in common with that of all other nations is undergoing a severe test to its perseverance and fortitude. Despite this Japanese shipping has considerably increased. Of the latest developments in Japanese shipping the Toyo Kisen Kaisha transferred all of its Pacific ships to the Nippon Yusen Kaisha, by which the latter became one of the greatest shipping companies of the world.

Aid and Encouragement In 1874, the Government established the policy that the shipping business should receive Government subsidies and it gave to the Mitsubishi Co., which rendered great services during the

Digitized by Google

Formosan affair, thirteen ships and guaranteed to subsidize the company with ¥250,000 for navigation and with ¥15,000 for training seamen for a term of fifteen years. In return for this, the company was to run regular ships on prescribed routes, carry mails without charge, and meet any requisition of ships by the Government. Each succeeding Government has recognized the functions that shipping companies have to discharge in peace and war, and have never failed to apportion money from the national treasury even in times of retrenchment. Some of the principal decrees connected with the encouragement of shipping are as follows:

(1) The first subsidy to the Mitsubishi Company in September, 1874.

(2) The second and third orders to the same company in 1875 and 1881.

(3) The subsidy to the Nippon Yusen Kaisha in September, 1884.

(4) The subsidy order issued to the Osaka Shosen Kaisha in 1886.

(5) Enactment of the Navigation and Shipbuilding Act in 1895.

(6) Amounts to subsidize lines to Bombay, Australia, Europe and America were granted.

(7) Subsidized lines were extended later to the Inland Sea, the Kinkai (near seas), the Yangtze River route, Canton, Tientsin, Dalny, the South Seas, West Coast of America, the South American routes, etc.

Working Agreements

Japan's three largest shipping concerns, the Nippon Yusen Kaisha, the Osaka Shosen Kaisha and the Kinkai Yusen Kaisha, the last-mentioned being a subsidiary of the first, entered into an agreement in April, 1931, on shipping co-operation as a counter-measure for the shipping depression. The basic principles involved in the agreement were the mutual respect of services operated by them, the readjustment of steamship routes, the extension of the pooling system and co-operative management. The agreement is to last for 10 years. As the result of this agreement, the Nippon Yusen Kaisha abolished its South American Atlantic service, leaving its operation to the Osaka Shosen Kaisha. The Osaka Shosen Kaisha discontinued the operation of its Puget Sound line, leaving the entire interest of the service to the Nippon Yusen Kaisha, and the Osaka Shosen Kaisha entrusted the management of its North European line west of Suez to the Nippon Yusen Kaisha. The mutual use of agents, joint acceptance of passenger and goods transportation, joint utilization of shipping, land and sea equipment, and the joint purchase of fuel and ships' materials were agreed on among them.

The Present State

Owing to the improvement of dollar exchange, the earning of freight quoted in the U.S. dollar was reduced by 20 or 30 per cent. Where the freight is quoted in sterling some difficulties were experienced in placing steamers, while the intended boycotting of Indian cotton by the Japanese cotton spinners served also to depress the market. For these reasons, the freight market was not as active in the latter part of 1933 as it was during the earlier season of the year. However, the indication was that it clearly had passed the worst stage such as it experienced in the last several years, and the sea transportation circle looked with much hope for the future for the first time in many years.

To explain the situation more fully, the Nippon Yusen Kaisha, Ltd., showed the possibility to resume the

Digitized by Google

payment of dividend, which had been withheld for many terms. Chosen Yusen Kaisha, Ltd., declared that it would be able to pay dividend of 3 per cent. Meiji Kaiun Kaisha, Ltd., which was able to pay dividend of 4 per cent. in the previous term would perhaps increase it by 1 or 2 per cent. In this manner, the sea transportation circle is in a somewhat buoyant atmosphere, the like of which was not seen for many years.

Tramp Ships The most important overseas work of Japanese tramp ships is connected with the shipment of Oregon lumber from Puget Sound to Japan and other Oriental countries; of Australian wheat to British India and Japan; of Manchurian staple products, mostly beans, to Europe; grain from N. America to Europe; coal from Wales to Port Said; and of Saghalien lumber to Japan. In the near-sea service, the transportation of soy beans and bean cake from Dairen to Japan and Kyushu coal from Wakamatsu to different ports is the most important business. In the ocean-going service, the Oregon lumber freight is taken as the criterion for all other steamer freights and in the near-sea service the Wakamatsu-Yokohama coal rate is the important one.

Government Subsidies

There are eight steamship companies working overseas and domestic services under governmental subsidy. These concerns are the Nippon Yusen Kaisha, the Osaka Shosen Kaisha, the Nisshin Kisen Kaisha, the Nanyo Yusen Kaisha, the Kinkai Yusen Kaisha, the Kokusai Kisen Kaisha, the Kita Nippon Kisen Kaisha and the Kuribayashi Shosen Kaisha. The subsidy is paid to these companies for a period of one year from April to March in most cases, while in certain cases the subsidy runs over a period of three years.

The N. Y. K. Yokohama-London service has Kobé, Shanghai Hongkong, Singapore, Colombo, Suez, Port Said and Marseilles as intermediate ports of call. Its San Francisco line has Honolulu as the only intermediate port of call on both outward and homeward (eastward-bound) trips. On the westward-bound trip it has Nagasaki, Shanghai, and Hongkong as such. The company's Yokohama-Seattle (eastward-bound) service has Victoria or Vancouver as ports of call and its westward-bound service has Kobé, Moji and Shanghai as ports of call. Its South American Coast line between Yokohama and Valparaiso (eastward-bound) has Honolulu, Manzanillo, or Salina Cruz, Callao and Iquique as ports of call and its westward-bound line has as ports of call Kobé, Moji and Hongkong. The N. Y. K. Yokohama-Melbourne service has as ports of call Kobé, Nagasaki, Hongkong, Manila, Davao, Thursday Island, Brisbane and Sydney both ways.

The O. S. K. South American East Coast line (Yokohama-Buenos Aires) for its outward bound trip has as ports of call Kobé, Nagasaki, Hongkong, Singapore, Cape Town, Rio de Janeiro and Santos. On homeward bound the line has Santos, Rio de Janeiro and Christoval as ports of call. The O. S. K. African East Coast line operates between Kobé and Cape Town and on its outward bound has Moji, Hongkong, Singapore, Colombo, Mombasa, Zanzibar, Dar-Es-Salaam, Beira, Lourenço Marques and Durban. On homeward bound the line has Durban, Lourenço Marques, Mombasa, Zanzibar, Singapore and Moji as ports of call. These are the most important steamship lines operated under Government subsidy.

The Kokusai Kisen Kaisha, owner

Digitized by Google

of motor and steam vessels aggregating 310,000 tons deadweight, has reached new heights of prosperity under the able management of Mr. S. Kurokawa, President, the net profit for the half-year ending December 31st, 1934, having amounted to over ¥1,460,000. During the last few years, seven speedy new motor vessels have been built and placed in commission on the Orient-New York express service whilst three 19-knotters now under construction will be added to the fleet early next year. This concern which was mainly engaged in tramp shipping before, now maintains several regular services of international importance, thus contributing much towards the betterment of Japan's foreign payments.

In addition, the Nanyo Yusen Kaisha operate under Government susidy the South Sea Line between Kobé and Sourabaya and Java lines. The former line has Macassar, Sourabaya, Samarang and Batavia on outward trip. Ships sail direct for Kobé on homeward trip. The Nisshin Kisen Kaisha operates the China Coast line between Shanghai and Canton as southern line and between Shanghai and Tientsin or Taku as northern line. The company also maintains the Shanghai-Hankow line with Chenkiang and Nankiang as ports of call, the Hankow-Ichang line with Shasi as port of call, the Hankow-Hsiangtan line with Changsha as port of call, the Hankow-Chagteh line, and the Ichang-Chungching line, all these five lines being known as the Yangtze River services.

The Kinkai Yusen Kaisha, affiliated with the Nippon Yusen Kaisha, operates a subsidized regular service between Kobé and Tientsin or Taku during the winter time with Moji as port of call and also the Yokohama-Newchwang (Yingkow) service with Nagoya as port of call, both under Government subsidy. It also runs a regular service between Hakodaté and Odomari in Karafuto. The N. Y. K., O. S. K. and Harada Kisen Kaisha jointly maintain a Kobé-Tsingtao regular steamer service. The Tsuruga-Vladivostok regular service is operated by the Kita Nippon Kisen Kaisha, which is affiliated with the Osaka Shosen Kaisha. The Kuribayashi Shosen Kaisha, Hokkaido, operates a regular service between Hakodaté and Petropavlovsk in Kamchatka seven times a year during the warm season. Stores and other supplies of daily necessity are carried by ships on the service for Japanese fishermen engaged in Kamchatka fishery. A regular connecting service between Aomori and Muroran is maintained by the Kita Nippon.

Nippon Yusen Kaisha regular liners sailing between Japan and Europe will call on their outward trips at Istanbul and Beirut more than twice every three months, those sailing between the same places will call on their outward and homeward trips at Piraeus more than twice every three months, and those sailing between Japan and the United States will call on their homeward trips at Havana in Cuba once every two months, all under Government subsidy.

Open Ports The open ports in Japan are Yokohama, Kobé, Niigata, Ebisuko, Osaka, Nagasaki, Hakodaté, Shimizu, Takétoyo, Nagoya, Yokkaichi, Uno, Onomichi, Itozaki, Tokuyama, Imaharu, Shimonoseki, Hagi, Moji, Wakamatsu, Hakata, Karatsu, Suminoyé, Kuchinotsu, Miiké, Misumi, Kagoshima, Izuhara, Naha, Hamada, Sakai, Miyazu, Tsuruga, Nanao, Fushiki, Funakawa, Aomori, Otaru, Nemuro, Kushiro, Muroran, Otomari and Maoka.

Promotion of Seamen's Welfare

There are two important organizations for the promotion of seamen's welfare. They are subsidized by the Central Government. They are the Seamen's Aid Society of Japan and the Imperial Society of Life-Saving service.

Shipping for 1934

The general condition of Japanese shipping for 1934 showed a favourable tendency. While the condition of the world's shipping, as a whole, might be said to have emerged somewhat from a severe depression, there was no room for doubt that the demand for tonnage still continued at a low ebb, so that its supply was still in a glutted condition. Japanese shipping did not escape this general influence. A Government policy encouraging the construction of better freighters on condition that old ships be scrapped was announced by the Communications Ministry. The Government would grant subsidies for building new ships. The old ships to be scrapped must be aged more than 25 years and must be registered at home, Korea, Formosa or the Kwantung Leased Territory. The ships to be constructed must be freighters of more than 4,000 gross tons each. In pursuance of the policy, applications for building new ships were filed with the Communications Ministry by the Osaka Shosen Kaisha, Setsuyo Shosen Kaisha, Kuribayashi Shosen Kaisha and Dairen Steamship Company through the Ship Improvement Society. The Osaka Shosen decided to build a 6,300-ton freighter with a speed of 18.5 knots. It is to be fitted with Diesel engines and is to be completed in May, 1936, at the Mitsui Tama Shipbuilding Yard. For building it the Osaka Shosen will scrap two ships. The Setsuyo Kisen decided to build a 6,300-ton ship with a speed of 18.5 knots and powered with Diesel engines. This ship is expected to be completed in July, 1936, and two old ships will be scrapped. The Kuribayashi Shosen will build a 4,200-ton freighter with a speed of 14.5 knots. It is expected to be completed in July, 1936. Two old ships will be scrapped. The Dairen Steamship Co. will build a 5,000-ton ship with a speed of 15 knots. The ship is expected to be completed in June, 1936. Two old ships will be scrapped.

Commencing with April, 1935, a regular steamship service was opened between Niigata and North Korean ports with an annual Government subsidy of ¥20,000. The Japan Sea Steamship Company was founded under joint investment of the North Japan Steamship Company, subsidiary of the Osaka Shosen Kaisha, and the Shimatani Steamship Company. The Korean Government-General also decided to order the Chosen Yusen Kaisha to work the same service with the same amount of subsidy. The Dairen Steamship Company which was looking forward to come in for a share could not attain its object. The new service is destined to assume the leading position of all services in the Japan Sea.

Ship Price Ship price in Japan for 1934 rose considerably over the previous year. They were from 20 to 50 per cent. higher than in 1933. This was due to high prices of iron and steel and the scrapping of many old vessels due to the encouragement of the construction of superior Diesel-engined cargo boats by the Communications Ministry. Ship sale prices in 1934 were :

Digitized by Google

	New Ships	Secondhand Ships	Old Ships
	(In yen per ton)		
Large	170	85	50
Medium-sized	180	90	60
Small	200	100	80

Charter of Foreign Vessels As the price of scrap iron in Japan reached ¥50 a ton, ships imported into Japan in 1934 totalled 30 vessels with a total tonnage of 150,000 tons, a drop of 7 vessels and 125,000 tons from 1933. Ships scrapped in Japan in 1934 numbered 21, having an aggregate tonnage of 96,000 tons and represetning a decrease of 13 vessels of 50,000 tons from 1933. Foreign ships chartered by shipowners at the end of 1934 totalled 380,000 tons, a peak of recent charters. Most of these ships were from China, Norway and England. Partly due to the short period and partly to the high charterage offered by the Japanese, foreign shipowners were inclined to charter their vessels to Japanese. The average charter rates in Japan, compared with 1933, were :

Size of Ships	Charter rates for 1934 (in yen per ton)		Rates year before	
	Highest	Lowest	Highest	Lowest
2,000 tons	4.50	2.90	3.80	2.30
3,000 tons	3.80	2.40	3.25	1.85
5,000 tons	3.50	2.20	2.75	1.60
8,000 tons	2.70	1.80	2.25	1.60
9,000 tons	2 40	1.80	2.20	1.50

The Japanese Government has prohibited importation of foreign ships since May, 1933, except to replace those to be scrapped, and, because of this, chartering foreign ships becomes inevitable. The Government feared that reckless chartering of foreign ships would lead to activities of foreign ships in the Oriental waters, which would eventually hinder the progress of Japanese shipping. The Japan Shipowners' Association also entertained the same fear. But some Japanese shipping concerns did not share the fear. They contended that unless foreign ships were chartered, foreign shipowners would turn their attention to the Oriental waters as a prospective field of exploitation.

Building Programme The most noteworthy decision in the country's shipping circles for 1935 was adoption of a large scale plan providing for the construction of superior passenger boats by the Nippon Yusen Kaisha for its regular Orient-European line. The company's Yokohama-London regular passenger service is operated by 10 ships once every two weeks in competition with British, French, German, Italian and American ships. Four of these 10 ships, the Suwa Maru, the Fushimi Maru, the Katori Maru and the Kashima Maru are already more than 20 years old, and the company has fully realized their building costs. It takes about ¥8,000,000 to build a 10,000-ton passenger boat, since the building cost today is ¥800 a ton. The N. Y. K. has been working the service with these old ships in the face of various disadvantages and, feeling the need of overcoming the recently growing competition, the company decided to build new ships. The company was prompted by the expansion announcements of various foreign companies, which intended to construct new passenger boats for this service. The Norddeutscher Lloyd is planning to build two passenger ships each of 18,000 gross tons, with a speed of 20 knots per hour. These ships will be placed on the Far Eastern Service in co-operation with the Hamburg-Amerika Line. Lloyd Tiriest of Italy placed two superior passenger boats each of 18,000 tons on the new service. The air route between Europe and the Far East made considerable development within recent years. A regular air service between London and Singapore covers the whole distance in eight

Digitized by Google

days, while the N. Y. K. service takes 28 days. The need of building faster passenger boats is keenly felt. Nippon Yusen entered into a contract with the Cunard Line for trans-Pacific, Far East and European passenger services.

The Yamashita Steamship Company changed its business policy of drawing profit by chartering ships to operation of freight lines at its own risk and expense. As the result, it caused its sister institution, the Manchoukuo Sea and Land Transportation Company to buy four ships weighing 30,000 tons from the Nippon Yusen Kaisha, the Osaka Shosen Kaisha and the Fuso Steamship Company. It has also contracted to buy the Heijun Maru, 6,669 tons, and the Heian Maru, 6,694 tons, from the Industrial Bank of Japan, which foreclosed them in default of loans to the Nippon Steamship Company. The Industrial Bank has also decided to sell two other freighters, the Yoko Maru, 10,000 tons, and the Heimei Maru, 6,500 tons, to the Tochigi Trading Company. Formerly these ships were owned by the Nippon Steamship Company, but were taken over by the bank in 1925 upon the dissolution of the Nippon Steamship Company. Under the joint investment of Nippon Steamship, the bank established the Nippon Kyodo Steamship Company. By the sales of these four ships, Kyodo Steamship was cleared of all its ships. The total sales price was ₹1,700,000.

Nanyo Kaiun Kaisha Established A new steamship company jointly owned by the four Japanese companies, Nippon Yusen, Osaka Shosen, Ishihara Industry and Nanyo Yusen, which are interested in the Dutch East Indian service, was initiated at a Communications Ministry conference on June 22, 1935. The name of the new company is called the Nanyo Kaiun Kaisha and its capital amounts to ₹10,000,000. The company will take over the business interests on the Java services of the four concerns and will compete with the Java-China-Japan Line. The company will navigate 14 vessels, of which 12 vessels belong to the four companies, and 2 vessels are chartered ships.

Freighters Japanese freighters are concentrating their energy on the exploitation of Far East-New York cargo service. At the end of 1934 there were 42 Japanese freighters (six Nippon Yusen Kaisha, eight Osaka Shosen Kaisha, four Kokusai Kisen Kaisha, 13 Mitsui Bussan Kaisha and 12 Kawasaki Steamship Company ships) working the same service. This year the number is expected to increase to 55. This large fleet of Japanese freighters are in contrast to 15 freighters belonging to three foreign steamship companies on the same service.

Shipping Income on International Trade Net profit realized in connection with shipping on the international trade in 1933 amounted to ¥120,062,000, showing an increase of ¥26,361,000 over the previous year, according to the Finance Ministry. The income for the year amounted to ¥227,930,000 against the expenses totalling ¥101,868,000. The following table gives Japan's invisible exports and income in connection with shipping for 5 years :

RECEIPTS IN CONNECTION WITH SHIPPING

CHAPTER XXVII

JUSTICE AND POLICE

Judicature

The Judicature's Position

Since the promulgation of the Japanese Constitution in 1889, the right of the sovereignty of the Emperor has been divided into three distinct departments, viz., legislation, judicature and administration.

In accordance with Article 57 of the Constitution, "the Judicature shall be exercised by the Courts of Law according to law, in the name of the Emperor." Judges are appointed from among those possessing such qualifications as are determined by law and they are guaranteed by the Constitution against being deprived of their positions unless by way of criminal sentence or disciplinary punishment. Not only are the judges guaranteed their positions, but they have authority, in exercising judicial power, to judge on their own independent views, using the statutes as the sole standard of judgment, without being in any way swayed by interference from others and unaffected by authority arising from any quarter.

Since the judges are entirely independent of the administration, the results of judicial decisions are equally independent thereof, and the decisions are not affected by the administrative power except in cases of pardon or provisional release.

Composition of the Courts

In Japan, the ordinary Courts of Law for the adjudication of civil and criminal cases consist of (1) District Courts (Ku-Saibansho), (2) Local Courts (Chiho-Saibansho), (3) Courts of Appeal (Koso-in), and (4) the Supreme Court (Taishin-in). The District Courts, the Courts of Appeal and the Supreme Court are all collegiate courts with special divisions, in each of which sit a number of judges.

District Courts The District Courts are presided over by single judges. A three instance system is adopted in the adjudication of all ordinary cases, and any one may lodge an appeal against a judgment rendered in the first instance and demand revision of that rendered in the second instance.

In the matter of civil cases, the District Courts possess judicial power to adjudicate on the following matters in the first instance :

1. Demands for money less than 1,000 yen or for articles, the value of which is less than 1,000 yen.

2. The following cases irrespective of value :

(a) Legal actions brought by lessors against lessees, or vice versa, for the receipt, vacation, use, occupation or repair of houses or other building or parts thereof, or for the seizure of the furniture and fixtures or belongings of lessees by lessors.

(b) Legal actions only concerning the boundaries of real estates.

(c) Legal actions only concerning occupations.

(d) Legal actions brought by employers against employees, or vice versa, for contracts of employment, the terms of which do not exceed one year.

Digitized by Google

(e) Legal actions brought by travellers against hotel or inn keepers, or vice versa, for matters concerning board or lodging, or by travellers against water or land forwarding agents, or vice versa.

(f) Matters concerning bankruptcy.

In criminal cases, the District Courts, as the courts of law for adjudication in the first instance, possess judicial power concerning the following matters, provided they have not been subjected to preliminary examination:

1. Offences punishable with detention or fine.

2. Offences punishable with penal servitude, imprisonment for fixed terms or by imposition of fines, except those punishable with penal servitude or imprisonment for more than one year.

Local Courts In civil cases, the Local Courts possess judicial power concerning the following matters:

1. In the first instance:

Demands other than those falling under the jurisdiction of the District Courts or of the Courts of Appeal.

2. In the second instance:

(a) Appeals lodged against judgments rendered by the District Courts;

(b) Demands determined by law for revision of decisions or orders rendered by the District Courts.

Further, with reference to criminal cases, the Local Courts possess judicial power concerning the following matters:

1. In the first instance:

Criminal cases falling neither under the jurisdiction of the District Courts nor under the special jurisdiction of the Supreme Court.

2. In the second instance:

(a) Appeals lodged against judgments rendered by the District Courts;

(b) Complaints determined by law against decisions or orders rendered by the District Courts, except those falling under the jurisdiction of the Supreme Court.

Courts of Appeal The Courts of Appeal possess judicial power concerning the following matters:

1. Appeals lodged against judgments rendered in the first instance by the Local Courts.

2. Complaints determined by law against decisions or orders rendered in the first instance by the Local Courts, except those falling under the jurisdiction of the Supreme Court.

Powers to adjudicate in the first and second instances in civil cases brought against the members of the Imperial Family belong to the Tokyo Court of Appeal.

The Supreme Court The Supreme Court (Taishin-in) is the highest court of law and possesses judicial power concerning the following matters:

1. In the final instance:

(a) Appeals against judgments rendered by the lower courts;

(b) Complaints determined by law against decisions or orders rendered in the second instance by the Local Courts or by the Courts of Appeal;

(c) Complaints against decisions to reject appeals made by the District or Local Courts.

2. In the first, and at the same time, final instance: Preliminary examination and adjudication of offences against the Imperial House, offences of internal disturbance, and offences committed by members of the Imperial Family, for which punishment heavier than imprisonment should be imposed.

Public Procurators

A public procurator's office, with the necessary number of procura-

Digitized by Google

tors, is attached to each court. The work of the public procurator is, in accordance with the code of criminal procedure, to take legal actions, to go on with necessary legal proceedings, to demand a right application of the law, and to observe the right execution of a judgment. According to the code of civil procedure, he has also rights to ask for a report whenever he thinks it necessary and present his opinions to the court on it, and as a representative of public welfare he carries out his supervising business as laid down by the law in all judicial and administrative matters related to the court. But the public procurator acts absolutely independently of the court.

Court Officials and Procurators

Qualifications Candidates for the office of judge or procurator are chosen by the Minister of Justice from among those who have passed the higher judicial service examination. The selected candidates then have to serve a term of over one and a half years of probation in the courts or in a public procurator's office and pass a further examination, after which, should the report on their estimated ability be favourable, they will receive an appointment as judge or procurator. But those who have been professors of law in the Imperial Universities or lawyers of over three years standing can be appointed as judges or public procurators without examination and estimation.

The following are not to be appointed as either judges or public procurators.

(1) Those who have been convicted of a grave crime, with the exception of those political offenders who have been rehabilitated.

(2) Those who have served sentences on minor offences.

(3) Those who have been adjudicated bankrupt and could not be exempted from the responsibility.

Position of Judges and Public Procurators Judges are permanent officials appointed by His Majesty directly, or by His Majesty's order indirectly, or by His Majesty's approval, according to the grade of their position. Unless by way of criminal sentence or disciplinary punishment judges are not to be moved to another post or place, be suspended from office, be deprived of position, or receive a reduction of salary, without their consent, except in so far as the Minister of Justice may order retirement from service by the decision of a general meeting of the Court of Appeal or the Supreme Court on account of disability caused through weakness of body or mind.

The retiring age is for the President of the Supreme Court 65 years, and for other judges 63 years.

The public procurators are appointed by His Majesty directly or by His Majesty's order indirectly or by His Majesty's approval. Unless by way of criminal sentence or disciplinary punishment the public procurators are not to be deprived of their positions against their own will.

The Procurator-General at the age of 65 years and all other public procurators at 63 years of age must retire from service. A public procurator must obey the orders of higher authorities and judicial policemen must obey the orders issued by the public procurators or through them within the district of jurisdiction of the public procurator's office.

The Jury System

In 1923 the Jury Law was issued, and Japan finally adopted the jury system under which persons other than judges are allowed to take part

Digitized by Google

in criminal trials. The jury system is used in such criminal cases as where the punishment may be capital, or penal servitude or imprisonment for life. Other criminal cases in which the sentence may be penal servitude or imprisonment for a term longer than 3 years are tried by jury only upon demand of the accused and when they come within the jurisdiction of the Local Courts. The following cases are not submitted to trial by jury:

(1) Offences which come under the special authority of the Supreme Court.

(2) Offences against the Imperial House, causing an internal disturbance, helping an enemy, disturbing international relations, and sedition.

(3) Violations of the Peace Maintenance Law.

(4) Violations of the Military Secrets Preservation Law, the Army or Navy Criminal Laws or any other offences in connection with military secrets.

(5) Violations of the Public Election Laws.

The accused can refuse to have his case tried by jury or withdraw his own demand to be tried by jury at any time previous to the statement of the case by the public procurator, under which circumstances the case cannot be referred to a jury.

The jury is composed of 12 men. At the trial, the chief judge, after having heard all the evidence for and against the accused, sums up the facts and main points of the case, and charges the jury to deliberate and render its verdict by a majority vote. The verdict must be a simple statement as to guilt or otherwise. If the court considers the verdict improper the case may be referred to another jury at any stage of the trial.

In a case where sentence has been passed on a jury's verdict of guilt, no appeal can be made to the Court of Appeal, but a demand for revision may be presented to the Supreme Court.

Penal System

History It was in the time of the Emperor Suiko, 620 A.D., that the first written Penal Code was issued in Japan. The code was very simple, but later the Chinese penal code, the "To", was introduced and the Japanese code was drafted in a more systematic manner and promulgated by the Emperor Mombu, in 702, as the "Taiho Ritsu-Ryo." Five kinds of punishment were mentioned, namely, flogging, whipping, penal servitude, exile, and death, but in most cases these could be varied to confiscation of property or payment of a fine. Grave crimes were treason, atrocities, blasphemy, undutifulness to one's parents, adultery, etc. Confession of the accused was required as a necessary procedure of a criminal suit, and naturally torture was recognized as an indispensable means of obtaining such a confession. Several hundred years after the issuance of the Taiho Ritsu-Ryo the Shogunate Governments adopted extremely terroristic penal systems with the purpose of preventing the occurrence of criminal cases. One of the most important of them was the One Hundred Criminal Regulations of the Tokugawa Shogunate. It was a secret criminal code which was not published and was accessible to the judges only, an expression of the despotism of the ruling class that had as its motto, "leave the people ignorant of the niceties of law."

With the downfall of the Tokugawa Shogunate the Great Emperor Meiji abolished the system of intimidation and reformed the old penal code. The codification of Civil Law was carried on under the advice

Digitized by Google

of Monsieur Gustave Boissonade, a French scholar of jurisprudence who had been invited to Japan for that purpose. A new Penal Code and Criminal Procedure Law, the characteristics of which were that, though the lawful punishment of criminals is assured, the penalties are tempered with sympathy toward the accused and are in no ways severe, were enacted and promulgated. "No crime shall be punished unless there is a regulation in the law," (nullum crimen et nulla poena sine lege), is one of the guiding principles of the code, which was formulated on the French penal code of 1810. Within a few years it was found that the new code was out of date and various amendments were discussed from 1884 to 1907, in which year a thorough revision was made and the present Penal Code issued. Since then the social conditions of the people have undergone rapid changes, more advanced theories regarding penalties have been gaining ground and so many defects have been noticed in the present code, that in 1926 the Extraordinary Legislative Committee passed a resolution that the Penal Code should be revised. A special investigation committee set to work and in 1931 an outline and draft of a revised penal code and prison law was drawn up. It is expected that the thorough study of the draft that is now going on will soon be completed.

Penalties Penalties are divided into six kinds, namely, the death penalty, penal servitude, imprisonment, monetary penalties, custody, and fines. Confiscation is recognized as an additional punishment. The death penalty is by hanging and is carried out in prison. Penal servitude and imprisonment are for limited terms and for life; limited terms extend from one month to 15 years. Under penal servitude labour is compulsory, but a prisoner serving a term of imprisonment is not compelled to work, though he may be allowed to do so at his own request. A monetary penalty is 20 yen and above, unless made lighter on decision. Custody is from one to under 30 days, and a fine is from 10 sen to less than 20 yen. Those who cannot pay monetary penalties and fines are kept in workhouses as an alternative.

The classified number of penalties imposed during the five years 1929-1933 follows:

Year	Death Penalty	Penal Servitude for life	Penal Servitude for a term	Imprisonment for life	Imprisonment for a term	Detention	Total
1929	13	38	23,932	—	134	5,237	29,354
1930	15	43	27,007	—	360	5,765	33,190
1931	19	38	28,065	—	316	5,500	33,938
1932	22	57	31,339	—	378	4,491	36,287
1933	28	61	34,493	—	440	4,458	39,480
Average for 5 years	19	47	28,968	—	326	5,090	34,450

Suspension of Sentence and Provisional Release The present penal law allows probation. The execution of a penalty often leads to self-abandonment and turns comparatively harmless people, who are not yet addicted to criminal deeds, into habitual jail-birds. This is found to be especially so when the penalty is one of penal servitude for a short time, and it is, therefore, far better for people convicted of light and incidental offences to be excused from the real infliction of the penalty

Digitized by Google

under special conditions and to be given proper admonitions in order to make them repentant by self-examination. Consequently, the Japanese courts are empowered, under certain conditions, to postpone the execution of sentence for from one to five years, beginning with the day of the sentence and according to the nature and condition of the case, on persons sentenced to penal servitude or imprisonment for less than 2 years.

Probation is cancelled (1) when the probationer, during the time of probation, commits another offence and is sentenced to imprisonment or is given a heavier sentence, (2) when the probationer is sentenced to imprisonment or a heavier penalty is imposed because of some other crime committed before the granting of probation, and (3) when, in cases not mentioned above, the probationer is found to have had at some previous time a sentence of imprisonment or some other heavier penalty inflicted on him. Should the term of probation expire without being revoked the sentence is automatically cancelled thereby. The draft of the penal code of 1931, besides confirming the system of probation, admits the principle of postponement of passing sentence in specially pitiable cases of a non-serious nature.

Release on parole was practised as early as 1790 in the House of Correction at Ishikawajima, Yedo; the present law admits it and it is widely practised. As reformation is one of the chief aims of punishment, when convicts are evidently repentant and there is no fear of their committing further crimes, it is unnecessary to continue the punishment. Therefore, it is stated in the present Penal Code, "when the convicts who are under penal servitude or imprisonment are found to be evidently repentant, provisional release may be authorized by the administrative office after they have finished one-third of the limited term or ten years of the term for life" (Article 28).

Provisional release may be cancelled (1) when the persons on parole have committed another offence during the term of the release and have been sentenced to a monetary or heavier penalty, or (2) when they are sentenced to a monetary or heavier penalty because of some other offence committed before the provisional release, or (3) when they were sentenced to a monetary or heavier penalty because of another offence committed before the provisional release and that penalty must now be fulfilled, or (4) when they break the provisional release rules. In this case the rest of the term of sentence must be served.

Juvenile Criminals Article 27 of the Code of Criminal Procedure says, "public suit may not be instituted when the suit is found unnecessary because of the character of the criminal, his age and environment, the condition of his crime and his behaviour after the incident," and leaves the decision as to whether proceedings should be taken to the public procurator. The existing criminal system of Japan is thus inclined to some extent to subjectivism, putting emphasis on the offender himself rather than on the offence. Its evident expression is found in dealing with young offenders. According to the provisions of the Juvenile Criminal Law, 1922, young boys or girls who are under 18 years of age are called juveniles and their offences are dealt with, not under the penalty system, but by a system of protection. Even when they are punished, the penalty is inflicted in a special way. Protective measures are (1) to give

Digitized by Google

admonitions, (2) to leave them to the guidance of school principals, (3) to let them solemnly declare their sincere repentance in a written statement, (4) to place them, under certain conditions, in the care of their parents, (5) to place them under the care of temples, churches, protective bodies or other proper persons, (6) to hand them over to the care of the juvenile probation officers, (7) to send them to reformatories, (8) to send them to houses of correction, and (9) to put them under proper treatment in hospitals. These measures may be continued till the juveniles reach the age of 23 years. When juveniles are admitted to probation or provisional release they are not put under police supervision as is the case with the adults, but are left to the care of the juvenile probation officers. For the protective disposition of juvenile offenders juvenile courts have been established.

Special Measures for Juveniles Special measures for the penal punishment of juvenile offenders are:

(1) The death penalty or penal servitude for life is not inflicted upon a person who is under 16 when the crime is committed. When the crime is so grave that the death penalty or penal servitude for life should be passed, the sentence is mitigated to penal servitude or imprisonment for 10-15 years.

(2) When a juvenile criminal should be sentenced to a penal servitude or imprisonment of more than three years at its maximum, the minimum and the maximum limits are fixed within the scope of the penalty to be inflicted on the crime committed. And when he should be sentenced to a penalty of more than 5 years at its minimum, the term is diminished to 5 years. That is to say, in case of a juvenile convict an indeterminate sentence is admitted.

(3) Juveniles sentenced to penal servitude or imprisonment are put in a special jail or in a section of the common prison secluded from adults. If they reach the age of 18 during the term of confinement they may still be kept secluded till they reach the age of 23.

(4) Juveniles sentenced to penal servitude or imprisonment can obtain provisional release (a) after 7 years in case of a life-term sentence, (b) after 3 years in case of (1) above mentioned, (c) after serving one-third of the time in case of (2) above.

(5) Juveniles are not sent to work houses.

Second and Habitual Offenders

In case of those who repeat criminal deeds and commit other offences, especially in the case of professional and habitual offenders, it is necessary to put them into confinement for considerable lengths of time in order to give them time to reform their character and at the same time protect society at large from their depravations. To deal with these people Japanese criminal law provides a system of aggravating penalties for the recidivists and admits special dealing with habitual thieves as a complementary system.

Repetitious Offenders (Art. 56-59, Penal Code) When a person commits another crime and is sentenced to limited penal servitude within five years from the day of release from former penal servitude or from remission of execution of a penalty, he is classified as a second offender. Under the name of repetitious offenders come all second offenders and up. The cases of remission of penal execution are extinction of prescription, special pardon and the case stated in the Penal Code, Art. 5. Amnesty and probation not only

Digitized by Google

remit penal execution, but also cancel the effect of the penalty altogether, and the crimes concerned cannot be taken as the basis for forming a repetitious offence. Again, when a person commits a crime during a term of probation the offence for which the probation was admitted is not counted as the first offence. The penalty inflicted on a repetitious offender is aggravated.

Habitual Thieves Habitual offenders are most numerous in burglary and larceny cases. The habitual offenders often regard prison as their residence and repeat crimes immediately after their release, to the great harm of the community, in order to get back "home". They have, therefore, to be separated from society by the infliction of comparatively long sentences. In many cases it has been impossible to increase the penalty, or when it has been increased it has still been too short, and as there is no provision in the existing Penal Code for unlimited imprisonment the Thief Prevention Law was enacted in 1930. According to this law, when persons commit burglary or larceny habitually by the use of weapons, or by forming a band of more than two, or stealthily breaking into houses by night, they are punished by being sent to penal servitude for more than 2 years in the case of a thief and more than 7 years in that of a burglar. The draft of the revised penal law of 1931 adopts the system of incarceration for unlimited terms for habitual offenders (draft, Article 91-95).

Peace Preservation

Penalties are imposed as deterrents, but are not always effective, especially in the case of insane people and habitual drunkards, as well as in that of habitual offenders. For that reason it is advisable that, in addition to meting out punishment for any wrong-doings, it should be possible to segregate such people from law-abiding society. To meet this need, most of the countries of the world have a supplementary system of Peace Preservation Laws, which restricts to a certain extent the freedom of released persons as long as their dangerous character is unimproved. In Japan the existing Penal Code makes no provision for such a system, but the draft of 1931 suggests four kinds of peace preservation regulations, namely, preventive surveillance, curative treatment, compulsory labour, and preventive detention.

Surveillance When persons who are defective in mind or body or are deaf-and-dumb are to be sentenced to imprisonment or some heavier penalty, the Court can decide to place them under surveillance. In case the sentence has already been passed for one reason or other, surveillance will follow the execution of the sentence, but in some cases it may be carried out before the commencement of execution or at any time during its course, (draft, Art. 127). Those who are put under this measure are to be kept in the surveillance house and receive treatment for their defectiveness, while being under surveillance. They may be released when further surveillance is found unnecessary by order of the administrative offices. In principle the time of surveillance is 5 years, but this may be renewed by the Court when thought necessary. When the sentence of penalty and the surveillance disposition are pronounced at the same time, the Court may choose either one of them as either of the two became unnecessary by the enforcement of the other.

Curative Treatment When drunkards or users of narcotics commit

Digitized by Google

offences while in a state of intoxication or insensibility and it is found necessary to correct them of their bad habits, the Court may order them to be kept in Homes of Correction for a period of 2 years and receive proper curative treatment.

Compulsory Labour When persons who habitually commit crimes because of vagrancy or hatred of labour are to be sentenced, the Court may order compulsory labour together with the regular sentence for a period of 3 years, during which time they are to be kept in compulsory labour houses and compelled to work diligently under strict discipline in order to acquire the good habit of work. The chief official of the labour house may send them to work for the Government or to public or private factories, to farms or other places of labour, allowing them to stay outside the Compulsory Labour Houses, if deemed expedient.

Preventive Detention When the convicts who are to be released at the expiration of a term of penal servitude are found to be addicting to incendiarism or likely to commit murder or burglary, the Court may order them to undergo preventive detention, (draft, Art. 139). They are to be kept in Houses of Prevention and get the treatment necessary for leading them to full repentance. The duration of the treatment is 2 years in principle, but may be prolonged by the Court. This measure is to take effect after the expiration of the regular term of penal servitude, (draft, Art. 140-142).

Criminal Compensation System

A nation has the responsibility of compensating innocent persons who have been wrongfully punished or have been kept in detention during trial. The Criminal Compensation Law was enacted in 1931. Cases to be compensated according to the Law are as follows:

(1) When a verdict of "not guilty" or an acquittal has been given by the examining judge to a person who has been kept in detention, the State makes compensation for the loss caused by the detention.

(2) In case a verdict of "guilty" is reversed by a higher court and the accused has already suffered the execution of the penalty or was kept in detention before the execution, the State makes compensation for the loss caused by the penalty or detention.

When the accused is dead, the bereaved get the compensation. The bereaved in the terms of the Law are meant to be the spouse, children, grandchildren, parents, grandparents and those whose names were in the same census registration at the time of the death of the accused.

As compensation for unlawful arrest or detention, a sum of less than 5 yen is paid against the warrant of arrest or for each day of detention after the arrest or for each day of detention after the execution of the warrant of detention.

As compensation for penal servitude, imprisonment, or detention, a sum of less than 5 yen is paid for each day of the whole period. The same rule applies to detention before the execution of the death penalty.

As compensation to the bereaved of a person who has mistakenly suffered the death penalty, a sum of money considered reasonable by the Court is given in addition to the compensation for detention.

As compensation for a monetary penalty or fine wrongly imposed, the amount of money corresponding to that of the monetary penalty or fine already paid is given back. In case a person was unable to pay the amount imposed and in lieu was kept

Digitized by Google

in a labour house a sum of 5 yen for each day of detention is paid as compensation.

Claims for compensation should be made to the Court returning the verdict of "not guilty" or to the Court in which the examining judge pronounced the acquittal.

Statistics

In the following there are attached a number of statistics relevant to the judicature of the country for reference:

I NUMBER OF COURTS (Oct. 1, 1934)

	Supreme Court	Courts of Appeal	Local Courts	Branch Courts	District Courts	Branch Offices
	1	Tokyo	11	17	64	413
		Osaka	9	12	43	277
		Nagoya	6	9	30	203
		Hiroshima	6	13	36	252
		Nagasaki	8	17	53	284
		Miyagi	6	16	36	228
		Sapporo	5	3	20	96
Total	1	7	51	87	282	1,753

II CLASSIFIED NUMBER OF CASES INVESTIGATED BY THE PUBLIC PROCURATORS (1933)

Name of Offence	Number of cases new	old	Persons examined	Prosecutions cases	persons
Criminal Code Offences					
Against the Imperial House	37	10	67	10	12
Against the execution of official duties	1,048	38	87	227	316
Escaping from prison, etc.	30	—	33	14	14
Giving shelter to a criminal or destroying evidence	116	1	217	21	32

Prison System

Historical Background

A short historical retrospect of our penal system will show that it is only in comparatively modern times that "Imprisonment" became the recognized method for the punishment of crime.

Up till recent times the idea at the root of the Japanese penal system was minatory. In other words, the so-called principle of general prevention by warning the people at large against the commission of crimes by imposing heavy punishments upon criminals was adopted. Accordingly, the punishments were principally capital and corporal and extremely cruel in character. For instance, the Criminal Code of the Yedo Period (1502-1867) recognized the exposing in public of the heads of persons executed; crucifying, burning at the stake and other similar cruel punishments were imposed. In those days the jails were used merely as places of detention for various offenders until their trial, not as places for reforming offenders. Imprisonment was a very unusual form of punishment, for prisons were unknown and imprisonment was not a legal penalty.

Exile and Banishment Punishments which brought loss of liberty for specified periods to the criminal were exile and banishment. Persons punished with exile were sent to distant islands and places such as Satsuma, islands of the Goto group, Oki, Iki and Amakusa, and there they were forced to work under such miserable conditions that most of them died of starvation. Banishment was a penalty designed to expel persons convicted of crimes from certain fixed areas, and, as the result of the enforcement of this punishment in certain districts industries declined and farms and fields lay waste, giving rise to many social evils such as the increase in the number of ronin (masterless samurai), mushukumono (vagabonds) and other dangerous elements. In 1778, therefore, as a remedial measure, the Tokugawa Shogunate instituted the system of kozan-yékifu (mine labour) and, in 1790, that of ninsoku-yoseba (places for the detention of convict-coolies). The system of kozan-yékifu dealt with vagabonds with no previous convictions. These were sent as coolies to pump water out of the Sado gold-mine. In and after 1788, those who had been punished with flogging or marked with tattooes as ex-convicts and were homeless or those who, it was feared, might perpetrate crimes in the future were sent there also.

Prototype of Present Prisons The ninsoku-yoseba were to all intents and purposes the prototype of present day prisons and penal servitude. These places for the detention of convict-coolies were located at Ishikawajima and Tsukudajima in Yedo and at Kamigo-mura, Tsukuba-gun, Hitachi province, and there vagabonds and those who had been punished with flogging or marked with tattooes as ex-convicts were detailed to work as oil pressers or at other kinds of labour for a fixed wage, with the ulterior object of giving them such instruction and training as would fit them to lead the lives of respectable members of society. In and after 1820 those who were punished with banishment heavier than that from the confines of Yedo (Tokyo) were put to forced labour for a fixed period of time in lieu of that punishment. Thus the ninsoku-yoseba, which had been instituted as workhouses for vagabonds, were turned into prisons for the reclama-

Digitized by Google

tion of criminals through ordered life and labour. In its correctional idea ninsoku-yoseba was entirely identical with the London "Bridewell," which was established in England in 1550 "to punish, correct, and reform by labour of a diversified nature," and the Amsterdam workhouse (tuchthuis) founded at the end of the 16th century and well known for its motto, "Schrick niet! ick wreeck geen quaet, maer dwing tot goedt, straf ist myn handt, mar lieflijck myn gemoedt." (Do not fear! I will not take revenge upon you for your misdeed; on the contrary, I wish to lead you to good. Although I am rigorous in handling you, my heart is filled with kindliness towards you.) In and after 1790 the prisoners detained in the ninsoku-yoseba who behaved well and showed notable signs of penitence were liberated on certain conditions and this may be taken as the enforcement of provisional release of prisoners for the first time in Japan. When it is remembered that the system of provisional release of prisoners in Europe originated in a favoured release of prisoners from a convicts' colony in Australia in 1791, it is an interesting coincidence that the same system was inaugurated simultaneously both in the West and the East.

Improvement of 1872 In 1871, with a view to carrying out a great improvement in our prison system, the Emperor Meiji despatched the Vice-Director of Prisons, Mr. Jinsai Obara, to Hongkong and Singapore to inspect and study the prison systems there, and, as a result, the Prison Regulations, the first written law concerning prisons in Japan, were promulgated in 1872. According to the provisions of these regulations, the reclamation and education of the inmates of prisons should be based on love and benevolence. At the beginning of the Regulations, it is stated: "Prison is a place for the incarceration of criminals for chastisement. They are placed there because of love and benevolence towards them and not because of any desire to inflict cruelty upon them; prison is intended for chastising them and not for subjecting them to hardships. Punishment is imposed on them because it is unavoidable and because it is a means of removing evil from the State. The authorities of prisons shall conscientiously observe this principle in treating prisoners." The Regulations were framed on a progressive system and on very advanced lines, but subsequently their operation was suspended for a time, and, in 1881, the Revised Prison Regulations were published. The Regulations were again revised in 1889, and, with the revision of the Criminal Code in 1907, the existing Prison Law was enacted that year and published the following year.

Management of Prisons

Prisons are placed under the control of the Minister of Justice. Prior to 1900, they were under the control of the Minister of Home Affairs, but, since that year, they have come under the supervision of the Minister of Justice. With the transfer of affairs relating to prisons from the Department of Home Affairs to the Department of Justice, the Bureau of Prisons was established in the latter Department for the administration of matters concerning the execution of sentences, prisons, provisional releases of prisoners, and the identification of criminals by finger-prints. A Director, several secretaries and a hygiene official of the Department, several clerks and three assistant-experts in finger-prints were appointed to conduct the business of the Bureau.

Digitized by Google

Today there are 52 ordinary prisons, 3 reformatory prisons for minors, and 103 branch-prisons, and of 1933, was 56,627. (See Table IX, p. 763.)

The kinds and regular number of prison officials are as follows:

Governor (officials of sonin rank)	43
Assistant-governors (officials of sonin rank)	34
Doctors (accorded treatment as officials of sonin rank)	93
Chaplains (accorded treatment as officials of sonin and hannin ranks)	142
Instructors (accorded treatment as officials of hannin rank)	37
Industrial work experts (accorded treatment as officials of sonin rank)	19
Assistant industrial work experts (accorded treatment as officials of hannin rank)	421
Assistant doctors (accorded treatment as officials of hannin rank)	44
Pharmacists (accorded treatment as officials of hannin rank)	10
Chief warders (officials of hannin rank) (including 5 chief wardresses)	479
Interpreters (officials of hannin rank	4
Warders (accorded treatment as officials of hannin rank) (including 171 wardresses)	6,669
Workers, miscellaneous	627
Total	8,622

Prison superintendents are appointed from among officials ranking as governors and assistant-governors by the Minister of Justice, and branch-prison governors from among assistant-governors and chief warders.

Classification

In the Japanese prison system there are four kinds of prisons: (1) prisons for those sentenced to penal servitude; (2) prisons for those sentenced to imprisonment; (3) houses of detention for persons destined to spend time in detention, and (4) prisons of confinement for (a) those sentenced to death, (b) those awaiting trial. In view of the different characters of these prisons, they should, in principle, be established independently of one another, and, in the case of their being erected in the same area, they are usually separated. At present, workhouses are not classified as prisons, but are attached to prisons for the sake of convenience.

Treatment of Prisoners

Object of Treatment As to what is the primary and fundamental purpose of punishment of imprisonment, nothing is stated in the Criminal Code or in the Prison Code now in force. Some Japanese jurists are of opinion that punishment must remain in its essence retributive and deterrent, accordingly a prisoner must be made to expiate his offence by a dull, soulless, and monotonous servitude, but such new scholars of criminal law and penology as Dr. Yeiichi Makino, Professor of Criminal Law, Tokyo Imperial University, Prof. Kameji Kimura and Dr. Akira Masaki, Assistant Director, Bureau of Prisons, Department of Justice, interpret it as a form of education and emphasize its socializing effects. Be that as it may, Japanese juridical authorities have for more than ten years endeavoured to reform prisons on the latter principle. On April 4, 1924, Dr. Kisaburo Suzuki, the then Minister of Justice, declared at a meeting of officials connected with prisons and criminal affairs, "The enforcement of punishments consists in the adoption of such measures as may improve the quality of convicted persons and socialize them as good and law-abiding members of society." Further, at a meeting of the governors of prisons and reformatory prisons for minors held on October 11, 1927, Dr. Kado Hara, the then Minister of Justice, gave the following instructions:

"The object of enforcing punishments on the inmates of prisons is to cause them to reflect on and repent their offences and to turn

Digitized by Google

them into good members of society. There are many and various means of attaining this object, but they are, in the final analysis, to cultivate their character, to give them training for different occupations, and to maintain their health in good condition, while improving the circumstances which constitute the causes of their offences so as to enable them to lead a decent life. In order to realize the end aimed at, therefore, a mere confinement and watching of them is not sufficient; on the contrary, it is necessary to know their individual characteristics and to inquire into and ascertain the motives and causes of their crimes, giving them thereby appropriate treatment."

Classification System Inasmuch as punishment by the restriction of personal liberty is enforced today principally with a view to education, criminals are properly classified according to ages, characteristics, terms of imprisonment, numbers and kinds of offences, and are then confined in different prisons so as to facilitate the enforcement of adequate measures for their education in accordance with their categories and, further, to prevent prisons from becoming breeding-places of crime through mutual contact and contagion as the result of promiscuous confinement of all grades. When it is impossible to distribute them among independent prisons and they are confined in the same area, prisoners are usually classified strictly and confined separately according to their categories. There are prisons for minors at Odawara, Kawagoyé, Himéji, Okazaki, Iwakuni, Kurumé, Morioka, and Hachioji and in Hokkaido for the confinement of those under 18 years of age sentenced to penal servitude or imprisonment, prisons for aged persons at Hamamatsu and Yonago and for women at Tochigi, Miyoshi and Miyazu. Further, there are prisons for the confinement of persons sentenced to terms of imprisonment exceeding 10 years at Kosugé, Takamatsu, Hiroshima, Okayama, Miyagi, and Abashiri; the Abashiri agricultural prison is intended for training prisoners as agricultural labourers. At Uraga, located in an old warship anchored off the port, is a branch of the Odawara prison for minors. There juvenile offenders are given training as fishermen, and sometimes engage in coastal and deep-sea fishing in sailing-vessels or steamers.

In addition to the above-mentioned classified confinement, with a view to proper individualized treatment, they are examined by doctors, alienists, psychologists and educationists to find out their psychopathic idiosyncrasies, hereditary natures, physiological peculiarities, adaptabilities to occupations, educational possibilities, etc. in different prisons previous to their confinement. Further, a "social diagnosis" is made by collecting reports on them from city, town and village offices, police stations, schools, and organizations devoted to their protection in order that they may be suitably classified for treatment.

Progressive System A treatment on the progressive system is accorded to convicts who form the bulk of the inmates of prisons. This treatment aims at leading them to repent and their treatment is graded in proportion to their aspiration and diligence, thereby gradually bringing them to the conditions of ordinary social life. The relaxation of the enforcement of penalties not merely extends the scope of the personal liberty of convicts, but serves to cultivate a sense of responsibility on their part and strengthens their will for self-reclamation. In short, its chief pur-

Digitized by Google

pose is not to make "good convicts", but to turn them into "good citizens." The treatment in question does not apply to persons who are sentenced to imprisonment for less than 6 months, aged and decrepit persons, and those of unsound mental or physical faculties. Any prisoner committed for the first time is kept in solitary confinement for a certain period of time and a close study is made of him. In the basis of the results he is classified according to character, physical and mental condition, number of convictions, age, nature of crimes, term of service, home, health and thought.

The Four Stages The stages of the progressive treatment are: (1) those under investigation; (2) those in course of correction and training; (3) those in process of improvement; and (4) those who have developed a sense of responsibility. After being subjected to a study of character, convicts are received into the first class to begin with. Those who are accorded this treatment are given fixed marks according to the terms of imprisonment and promotion to higher classes is given only when a sufficient number of marks have been earned by diligence, good conduct, and growth of the sense of responsibility and of the will for self-improvement. Those belonging to the first and second classes are kept in confinement in association, while those belonging to the third class are kept in confinement in association in the day time, but in solitary confinement at night, those belonging to the fourth class are confined in a special room.

The Treatment Governors of prisons may cause convicts in each workshop to elect some from among them to keep the workshop in good order and look after other necessary matters. The elected ones must be popular, trustworthy and belong to the third class. Prisoners belonging to the third class must jointly, once a month, carry out the work of cleaning and sweeping of prison grounds and keeping them in order. Except in cases of special need, prisoners belonging to the fourth class do not undergo physical examination or have their cells searched, and, further, are permitted to talk with one another so long as it does not interfere with the maintenance of discipline. They are also permitted to elect two representatives that they may express their desires to the authorities. These representatives are nominated by the governor of the prison concerned from among several candidates elected by prisoners belonging to the fourth class. Prisoners of the fourth class may be permitted to take a walk in a place designated for that purpose in the prison grounds in hours of recess, or hold meetings, take a walk in a group, or hold athletic meetings on days free from labour. They give a pledge to the governor, holding themselves responsible for the physical examination of those of their own class, for the search of their cells and keeping them in order, and the maintenance of order among themselves. In case of any one of them violating the pledge, the privileged treatment will be suspended for a part or all of them. Any one of those belonging to the first class who earns more than ¥5.00 for labour may be permitted to use less than one-fifth of the monthly total in buying postage stamps and in other ways that are deemed necessary; any one of those belonging to the second class less than one-fourth of the monthly total; any one of those belonging to the third class less than one-third of the monthly total; and any one of those belonging to the fourth class less than one-half of the monthly

Digitized by Google

total. While those of the first class are not permitted to change the kinds of labour they engage in, those of the second class and up are permitted to do so. Those who have superior skill or high efficiency and belong to the third class are charged with the task of directing industrial work and those who are similarly qualified in the fourth class are given the task of directing and supervising it. Those of the third class who have particularly superior skill and high efficiency are permitted to work for their own profit in time other than working hours, but that time is limited to two hours per day.

Moral Education Prisoners belonging to the first and fourth classes are chiefly given individual moral and religious instruction, while those belonging to the second and third classes receive the same instruction en masse. Listening to music broadcast on the radio and listening to the playing of gramophone records is permitted to those belonging to the second and higher classes. The time for the enjoyment of this privilege is fixed at twice a month for those belonging to the second class, which may be increased to three times and four times for those belonging to the third and fourth classes respectively. The governor may permit members of the third and fourth classes to hold moral cultural meetings, the number of times being limited to once for those belonging to the third class and twice for those belonging to the fourth. Prisoners of the fourth class are permitted to read books or see pictures in the prison library on days free from labour and may also borrow suitable newspapers and magazines from it. Those of the third and fourth classes may be permitted to play athletic games, the number of times for such amusements being limited to once a month for those of the third and twice for those of the fourth class. While those belonging to the first class are permitted to interview or send letters only to their relatives and those who are concerned with their protection, those belonging to the second and higher classes are permitted to interview or send letters to those who do not interfere with their moral instruction, besides their relatives. The number of times of interviews and of writing letters increases in proportion to advances in class.

Provisions, drinks and other articles for the maintenance of the health of prisoners are uniform and do not differ according to classes. Those belonging to the fourth class are given white garments, are permitted to decorate their cells with flowers or pictures, and are lent table-ware and other sundry articles for common use.

Suspension of Progress In case any prisoner violates the prison regulations, the treatment on the progressive system may be suspended for up to a period of 3 months, but, in case it is recognized that there are certain circumstances which have to be taken into consideration before the suspension or in case the prisoner shows signs of sincere penitence, the enforcement of the sentence of suspension may be postponed for a fixed period of time. If he further violates the prison regulations during that period, the sentence of suspension will be enforced, but, if he passes the said period without any further violation, it will not be carried out. Further, in case a prisoner shows marked signs of penitence after the sentence has been delivered, this will be taken into consideration and the sentence repealed in full or in part. In case a prisoner who has been punished with suspension of the treatment

Digitized by Google

again violates the prison regulations, he may be transferred to a lower class according to the circumstances of the case. When a prisoner who has been punished with such degradation shows marked signs of penitence, he will be restored to his former category without reckoning his marks.

When any person of the fourth class has served one-third of his term of imprisonment and the prison governor considers him fit for provisional release, his case should be reported on to the Minister of Justice. Even one who belongs to lower classes and who has served one-third of his term and shows notable signs of penitence and is considered to be fully adapted to social life may be specifically granted provisional release, subject to the approval of the conference for provisional treatment on the progressive system.

Prison Labour

Paragraph 2 of the Japanese Criminal Code provides: "Any convict sentenced to penal servitude shall be detained in a prison and subjected to a fixed amount of labour." This "fixed amount of labour" constitutes prison labour. It is not legally imposed on convicts punished with imprisonment or custody, but its imposition is permitted in case they desire it. Since the institution of the ninsoku-yoseba at Ishikawajima, hard labour has been recognized as an essential part of the discipline of prisoners, and present-day criminal theory in Japan is opposed to punishment by the restriction of personal liberty without the imposition of hard labour. Accordingly, the prison authorities are encouraging industrial work at their own request by prisoners punished with imprisonment or custody.

The Three Systems Industrial work in prisons is managed on three systems, viz.: the public account system, the "made-to-order" system, and the contract system. Under the public account system, a prison itself purchases materials, provides itself with the necessary machinery, implements and tools and makes prisoners manufacture or repair articles or carry on labour under the direction of prison officials, and sells the products. Under the "made-to-order" system, the chief materials are supplied by the outside buyers and prisoners either manufacture or repair articles under the direction of industrial work experts and assistant industrial work experts on the prison staff, and, when the articles are either manufactured or repaired, the wages of the workers and the cost of requisites in the manufacture or repair are calculated and the prices of the articles fixed by the standard of current prices. The articles are then delivered to the buyers on payment of the account. Under the contract system, applicants have to supply not only materials, machinery, implements and tools, but also experts for the direction of work, a prison only offering the labour of prisoners and receiving their wages in exchange. In the contract system now in force in Japan, the prison authorities undertake the supply of provisions, etc. to prisoners as well as their supervision and selection for work and nothing like the lease system that was in vogue in South American countries at one time is recognized.

Among the above-mentioned three different systems, the public account system does not permit any third party other than the prison officials to direct prisoners in the prosecution of their work as in the case of the contract system and, moreover, enables the prison authorities to select and impose on pris-

Digitized by Google

oners such kinds of work as are suited for their moral instruction and vocational education. In these respects, it is considered to be the most desirable for the enforcement of penological measures and its adoption is greatly encouraged.

Current Prices Considered When the selling prices of the articles produced in prisons are lower than current market prices, there is a fear of their adversely affecting private undertakings generally. Paragraph 17 of the prison industrial work regulations, therefore, provides : "The selling prices of the manufactures and agricultural products turned out under the public account system shall be calculated by the standard of current market prices, after taking into account the cost of materials and wages paid for the work, but the prices of articles intended for self-supply need not be fixed by the standard of current market prices." As, however, prisoners' wages are low, the selling prices are liable to become low, and the cry that prison products compete unfairly with products of private industries was heard many years ago, and as early as 1891, the competent authorities issued to the prisons throughout the country the following instructions, "As industrial work by prisoners may, it is feared, obstruct the business of the local people by reason of the methods adopted for its execution, care shall be exercised lest the local industrialists of minor standing should suffer or those private undertakings that bid fair to develop be nipped in the bud by using an excessive number of prisoners in one line of industry or by starting such industries as have hitherto been carried on by many local inhabitants and conducting them on a large scale." At the present day, the prisons principally adopt the "State use system", namely, a policy of manufacturing articles needed by the Government offices and public organizations and are taking pains to avoid competition with private undertakings as much as possible.

Training for Occupation In imposing work on prisoners, the most suitable kinds of work are given them not only by taking into consideration health, economy, terms of imprisonment, ability, occupations in free life, and future means of livelihood, but also by scientifically examining their individual adaptabilities to occupations. Industrial work in prisons is the most suitable means of giving moral instruction to prisoners ; in particular, to train them in certain lines of work in the course of detention is the best way to prevent their again perpetrating crimes. Since 1926, therefore, houses for the training of prisoners for occupations have been erected in different prisons throughout the country and there prisoners have been trained for occupations requiring special skill such as those of carpenters, joiners, furniture-makers, tin-smiths, plasterers, timber-mill workers, painters, smiths, shoemakers, etc. The term of training is 6 months, during which fundamental theories and practice are taught.

Reward Given as Favour Working hours are from 12 to 13 hours a day and differ according to months. It is permitted to give educational or moral instruction to prisoners or allow them to take exercise within these hours. A time of recess—15 minutes in the morning and 25 minutes in the afternoon—is given them. All the income from the work of prisoners goes into the national treasury, irrespective of whether it arises from work or from wages. A prisoner who has worked may receive a reward as a favour. This gratuity varies from ¥0.20 to ¥10.00 per month and the sums are fixed

Digitized by Google

according to conduct, character, kinds of work, and the results of the work done. Any one who does particularly superior work is given an additional reward not exceeding ¥10.00. The reward for his work is, in principle, not given a prisoner until he is released from prison, but (1) in case a prisoner is entitled to ¥10.00 a month or more, and the money is needed to support his father, mother, wife, child, or to compensate the sufferer from his crime, or to purchase books or other necessary articles, one-third of the amount may be given him while in confinement, and (2) in case it is particularly necessary to do so for the sake of a prisoner, the entire reward may be handed over to him, irrespective of its amount and the way of spending it. In case a prisoner has been injured or has fallen sick while at work, and has died in consequence or has become unable to carry on any work, he may be entitled to a pecuniary reward according to the circumstances of the case. This reward is fixed within the limit of from ¥50 to ¥180 according to the details of the case.

The Hito Prisoners are given moral instruction en masse on national holidays, on the first two days of January and the 31st of December, or on Sundays. The same instruction is also given prisoners individually in case it is deemed necessary. It is chiefly given by chaplains appointed from among priests of the Shinshu sect. Adult prisoners who are uneducated and those under age receive an elementary school education. The latter are also given military training, which gives very satisfactory results in the way of moral instruction. Prisoners are permitted to read books and look at maps and pictures, unless it is injurious to the good order of the prison, but writings concerning current topics are forbidden. As, however, it is needful to keep them acquainted with changes in the condition of society, lest they should fall behind the times, a specially edited newspaper "Hito" (Man) is issued and distributed among them.

Aid of Discharged Prisoners

In its initial stage of development, the aid of discharged prisoners was largely undertaken by the Government. As already stated, the systems of "kozan-yekifu" and of "ninsoku-yoseba" were the origin of punishment by the restriction of personal liberty and incidentally of Government provision for the protection of ex-convicts. After the Meiji Restoration, in 1881, a system called "betsubo-ryuchi" (detention of discharged prisoners in separate quarters) was instituted, under which discharged prisoners who, after the expiration of their terms of sentence, had no one to go to, were detained in special quarters in prisons to enable them to make a living and to be protected by the authorities. As, subsequently, the number of these ex-convicts increased, this system had to be abolished in 1888, but, feeling that if those who had served their terms and had no one to look to or live with were allowed to live as they were inclined after their liberation, they might, it was feared, again lead a life of crime, the Government encouraged charitably disposed persons to carry on work for their welfare. Thus, the aiding of discharged prisoners by individuals and private organizations grew in scope.

The Organizations Among these organizations, one noted for its systematic constitution and management was the Shutsu-gokunin Hogo Kaisha (Ex-Convicts Protection Co.) established by Mr. Meizen Kinbara in Shizuoka prefecture. In 1907,

Digitized by Google

the Government decided to make an appropriation of ¥10,000 from the national treasury every year for the encouragement of the work and, later in 1912, the sum was increased to ¥30,000. With the development of the work, the number of organizations grew and was returned at 211 throughout the country at the end of 1912. In 1913, Baron Hachiroyemon Mitsui, head of the House of Mitsui, donated ¥750,000 to the work, and with this money the Hosei-Kai, a foundation, was established for the control of, and extension of help to, various organizations interested in the work throughout the country. In 1925, the Government subsidy was increased to ¥100,000, and, moreover, since 1923, the Imperial House has made an annual grant to encourage the work, with the result that the work has made a steady development, the organizations today number approximately 800.

The Beneficiaries The persons protected by these organizations are not limited to those who have served the terms of their sentences, but include those who have been provisionally released; those, whose prosecution is suspended; those, the enforcement of whose sentences is suspended; and those who have been released from punishment for minor offences; as well as the members of the families of those who are detained in prisons. The method of protection is roughly classified into (a) quarters and protection, (b) indirect protection, and (c) temporary protection. Those to whom the method (a) is applied are quartered in places specially selected by the above-mentioned organizations and are given board, lodging and clothes as well as employment. Those to whom the method (b) is applied are not directly protected, but visits are paid to their fixed places of residence from time to time so as to give them advice and suggestions. Those to whom the method (c) is applied are given only temporary help at the time of liberation from prisons such as providing them with clothes and other necessaries and journey money.

Today, there exists in the Department of Justice the Section for the Protection of Ex-Prisoners which undertakes the direction and supervision of the welfare work of various associations, but as it cannot be expected that a small Section can thoroughly undertake such widespread work, it is increasingly advocated in different quarters that a system for the promotion of the welfare of ex-convicts should be instituted and the work connected therewith conducted by the State.

Police System

Its Fundamentals

There are two aims of the national administration. One is the administration of political affairs for the direct benefit of the nation as a whole, and the other is to protect the public welfare of the individuals who compose the nation. The function of the police is to look after the latter. There is a judicial function of the police that goes side by side with the first one, but the principal significance of the establishment of the police system is in its protection of public welfare. The work it performs can be considered more in a negative aspect than a positive one for it does not promote welfare work so much as it prevents and roots out matters which are, or may be, detrimental

Digitized by Google

to peaceful social life. The police are endowed with authority to enforce the law or to give orders to the people. Police authority forms a part of the sovereign power of the State.

Authority Vested in State In Japan police authority is entirely invested in the State and is not delegated to other public bodies. In European countries, there are commonly the state police and the local police, the latter being under the jurisdiction of local authorities. In Japan all the police come under the direct administration of the State and no chiefs of local governments or local governments themselves have power over them except in a very few limited subjects. The police are administered in the name of the Emperor by the Minister of Home Affairs through the Superintendent-General of the Metropolitan Police, in Tokyo prefecture, governors of other prefectures and the Hokkaido procurator. Although nominally under the Governor of Tokyo prefecture, the Superintendent-General of the Metropolitan Police Board in Tokyo takes his orders direct from the Home Minister as the Board has many political responsibilities unknown in other prefectures. The appointment is actually a political one, the ordinary police business being carried out by the Chief of Police. In the Hokkaido and other prefectures the highest police official is the Chief of the Police Division. Under the Chiefs of Police are the police superintendents, inspectors, assistant inspectors and policemen. A police superintendent is appointed chief of a police station or secretary of a Police Division or in Tokyo and Osaka prefectures he may be appointed inspector over several police stations. A police inspector or an assistant police inspector may in some cases be appointed chief or secretary of a police station. Policemen are divided into sergeants, indoor and outdoor service men, special service men, and police-detectives.

As mentioned above, police officials carry out judicial functions, and when acting in the capacity of judicial police officials and under the dictates of the public procurators they execute warrants of arrest or detention and arrest persons in flagrant offence. They may seize private possessions or search a house by order of a Court of Justice, an examining judge or a public procurator, or help a public procurator in the investigation of criminal cases.

In Time of Peace and Crisis In times of peace the maintenance of public order rests with the police. Individual policemen wear sabres. Pistols are carried only in special cases though in the police force there are troops of armed constables, while if matters become too serious and on special occasions, the gendarmerie is called on for help. The gendarme is a kind of military policeman, but at such times as the police force is too weak to keep public order, a Governor may ask for the aid of the gendarmerie. Moreover, at a time of crisis or extraordinary social disturbance, the army takes the place of the usual police force and acts with a despotic authority without limitation of the Law. The occasions which may call forth the military power for keeping public order are as follows: (1) when the country or a district is placed under martial law in times of war, (2) when a district is put under martial law for the maintenance of public order, (3) when the governor asks for the help of the army for subduing social disturbances, and (4) when a Divisional Commander recognizes the need of military power for keeping local

Digitized by Google

order in an emergency in which the request from other authorities is too late.

Police Business

Police business in Japan is many-sided, and may be classified into 4 main lines and 24 kinds:

Public Peace (a) supervision of publications. The publication of all kinds of printed matter should be reported and a copy of each must be sent to the authorities. Secret publication is strictly forbidden. A sum of money as guarantee of good faith has to be deposited by the publishers of newspapers or periodicals which deal with political problems. The name of the person responsible for any publication must be printed on the publication. Secret matters which come under the control of the public procurators, the Ministers of War and Marine, and the Minister of Foreign Affairs must not be reported in newspapers or periodicals. The Home Minister may prohibit the publication of a periodical or any other printed matter which he considers detrimental to public welfare and morals.

(b) Supervision and care of public meetings, organization of societies and mass movements. According to the Public Peace Police Law, all public meetings on political questions and some other meetings which come under control of the authorities must be reported to a police-station beforehand. A policeman may be present at such a meeting and may stop a speech or close the meeting. The organization of such associations or societies as may endanger the existing form of Government and system of private property is strictly forbidden. The said P. P. P. Law inflicts heavy penalties on those who break these regulations.

(c) Supervision of businesses or commercial shops. Most businesses are free, but in some cases some kind of police supervision is necessary in the interests of public welfare, hygiene, prevention of damage, the safety of traffic, and social economy. For instance, such shops and businesses as inns, public baths, employment exchanges for geisha and prostitutes, credit information businesses, barbers, seal or stamp engravers, old clothes dealers, peddlers and stall-holders are inspected or taken care of by the police. Pawnshops and curio or second-hand shops are under special regulations and police inspection and supervision is thoroughly practised as many stolen articles find their way into these shops, and lead to excellent results in the arrest of thieves and burglars. Guides, scribes and employment exchanges for profit are also under special regulations and strict supervision.

Number of shops and houses under police supervision at the end of 1933 was as shown below:

(Items less than 10,000 are omitted)

Pawn shops	13,300
Dealers in second-hand articles	270,968
Hotels	49,552
Boarding houses	10,436
Doss-houses	14,442
Restaurants	63,084
Cafés and bars	85,200
Geisha houses	20,949
Bath-houses	22,235
Eating houses	159,340
Employment exchanges	12,879
Printing houses	13,705
Barber's shops	74,694
Woman hair-dressers	55,095
Game houses	20,398
Building contractors	31,125
Shipping agents	11,839
Waggon-business men	149,446
Taxicab garages	23,381
Scribes	18,640
Bicycle dealers	37,676
Rikishamen	20,468
Factories	74,701
Theatres	85,095
Cinema theatres	77,577
"Yosé" (Story-telling houses)	16,302
Licensed prostitution houses	10,281

Digitized by Google

(d) Religion. It is the duty of the police to prevent the desecration of shrines and breaches of the peace in temple grounds. Superstitions and superstitious actions are prohibited by the Police Penal Law.

(e) Accidents. The police take charge in cases of fire, floods, explosions, of people being injured, etc. Regulations are issued on the handling of guns and explosives; the wearing of swords or the like is strictly forbidden; the handling or selling of poison is under a special regulation. Sulphur and oil businesses are under police care also. Buildings are under police supervision for their beauty, fire-proofness, and hygiene; factories, warehouses, theatres, and public resorts receive special attention. Crematories, slaughter-houses and incinerators must not be within residential or commercial districts of cities. Regulations regarding buildings are stricter than in Western countries because of the large number of wooden houses liable to fire and the constant fear of earthquakes. Electricity and gas businesses must not endanger the lives of people. Mines are under a special police regulation as they are most liable to fatal accidents. Prevention of floods also comes into the sphere of police business.

For the prevention and extinction of fires, fire-brigades are established in cities under the control of the Chief of the Police Division in the prefecture. In Tokyo prefecture, a fire division is established in the Metropolitan Police Board and fire-brigade stations are located in different parts of Tokyo. In the larger cities, Osaka, Kyoto, Yokohama, Kobé and Nagoya special fire-brigade stations are established by the State. In the smaller municipalities fire-guilds are established at the expense of local self-governments. The firemen are volunteers and differ from those in the said cities who are officials of the State.

Statistics of fires happened during recent five years are as follows:

NUMBER OF FIRES AND AMOUNT OF DAMAGES

	1929—1933				
	1929	1930	1931	1932	1933
Number of fire	11,983	14,610	16,286	18,334	18,300
Number of houses damaged	25,174	22,280	22,334	25,690	19,461
Amount of damages estimated (In 1,000 yen)	67,343	55,637	54,976	61,780	35,397
Average amount of damages per one house (Estimated)	¥ 2,675	2,497	2,461	2,402	1,844

NUMBER OF PERSONS SUFFERED FROM THESE FIRES

	1929—1933								
	Firemen			People			Total		
	Dead	Injured	Total	Dead	Injured	Total	Dead	Injured	Total
1929	16	1,618	1,634	457	1,139	1,596	473	2,757	3,230
1930	20	2,204	2,224	415	911	1,326	435	3,115	3,550
1931	17	1,806	1,823	473	922	1,395	490	2,728	3,218
1932	28	1,981	2,009	451	1,169	1,620	479	3,150	3,692
1933	20	1,761	1,781	570	960	1,530	590	2,721	3,311

(f) Public morals. The police look after the maintenance of good public manners and morals. Japan has a licensed prostitute system and forbids private prostitution and conniving at it. Through the efforts of

Digitized by Google

Christian and other religious and public bodies and the growth of other means of pleasures prostitution is growing less, but it is a duty of the police to see that the prostitutes are treated as humanely as possible as long as the term exists. All pleasure resorts such as theatres, places of performances, wrestling, movies, etc. are carefully supervised and any obscene or immoral performances prohibited.

Restaurants, dining rooms, bars, cafes and other eating places are under police supervision. The laws for prohibiting liquors and smoking to minors, the prohibition of lotteries, misbehaviour in the street or outdoors, and the regulations regarding street advertisements and the erection of monuments must be enforced.

(g) The care of men who are a danger to public peace and welfare, juveniles who are addicted to bad habits, ticket-of-leave men, the insane, beggars and vagrants are supervised by the police.

(h) Actions which may harm others such as forcing an interview, extorting contributions, blackmail, causing disturbances, obstruction, etc., are forbidden by the Police Penal Law. Deceitful actions, spreading false reports, and the mishandling of dead bodies come under the care of the police. Obstructing officials in pursuit of their duty is strictly forbidden. The care of lost articles, prohibition of deceitful religious actions, the supervision of "mujin-ko" and "tanomoshi-ko" or mutual financing associations come under police power to some extent.

Public Hygiene The problem of the health and hygiene of the people is one of the greatest concerns of the Department of Home Affairs, and in many points the responsibility of looking after such cannot be confined to the police alone, though in its direct management the police have much to do.

(a) Prevention of epidemics. For the prevention of epidemics there are many laws in force, the most important of them being the Epidemic Prevention Law, the Regulation for the Medical Inspection of Aviators, the Seaport Quarantine Law, the Vaccination Law, the Tuberculosis Prevention Law, the Trachoma Prevention Law, the Leprosy Prevention Law, the Venereal Diseases Prevention Law and the Parasites Prevention Law. The water police help in the medical inspection of passengers and goods arriving in vessels from abroad. The annual compulsory cleaning of individual houses and public buildings, drains, wells, dumping grounds etc. is supervised by the police. When an epidemic breaks out policemen are used to try and confine it to as small an area as possible.

(b) Medical. As the health and welfare of the people depend on proper medical attention, doctors, dentists, midwives, nurses, masseurs and acupuncturists are under special regulations, as also are druggists and pharmacists. Poisonous chemicals are well looked after.

(c) General Health. A law is in force prohibiting the sale of unwholesome food, and utensils for eating, drinking and preparing food are under police supervision. (See Chapter XXXII.)

Traffic Police (a) Road. The police are responsible for safety on the streets. "Walk on the left" is the rule of the road in Japan.

(b) Vehicles. Railroads, electric cars, automobiles, trucks, waggons, rikishas, bicycles etc. are under police supervision.

(c) Water police. The water police look after foreign-going vessels entering and leaving open ports, navigation in closed ports, rivers

Digitized by Google

and lakes, and the business of steamship companies doing a coastal trade.

(d) Ocean navigation has many international ramifications and though there are countless matters which ought to come under police supervision it is separated from common police business and put under the administration of the Department of Communications.

(e) The aviation police are put under the management of the Minister of Communications.

(f) Colonial police come under the control of the Minister of Overseas Affairs except in some cases which may come under the supervision of local governments.

Number of accidents caused by traffic is as shown below:

	1929	1930	1931	1932	1933
Walkers					
No. of cases	25,517	27,666	26,776	26,933	24,110

Police and the People

The function of the State, as far as it concerns the economic life of the people is largely protective and administrative and certain laws and ordinances of the State have to be imposed on various businesses in order that the people shall be fully protected. The police works by orders from higher authorities at the request of the Ministers of Agriculture and Forestry, Commerce and Industry, and Finance.

(a) Banks, savings banks, mutual financing associations, negotiable security businesses, trust businesses, insurance businesses, commercial exchanges, the central wholesale markets in the six largest cities, foreign trade business in important articles, weighing and measuring machine businesses, and auditors partially are under police supervision or limitations.

(b) Agriculture is supervised by the police in such matters as the prevention of the spread of noxious insects, the control of plants imported or exported, the fertilizer industry, agricultural warehouses, the sericulture industry and the control of rice imports and exports.

(c) The hygiene and prevention of epidemics among domestic animals is looked after by the police. Many laws are enforced regarding the improvement of animals, and

Digitized by Google

police power is needed for a proper practice of them, especially in connection with horse-racing.

(d) Forestry police mainly prevent damage to the forests.

(e) Fishery police protect the propagation of aquatic animals and at the same time look after the safety of the fishermen. There are many laws and regulations on fisheries, whale-fishing, fishing boats, etc.

(f) The hunting of beasts and birds is limited to those mentioned in the revised Game Laws of 1918, the seasons and districts of hunting are put under police regulation.

(g) For the protection of labourers there are numerous laws in force, for instance, the Factory Law, Laws on the limitation of age of factory or marine workers, the Labour Accident Prevention Law, the Mine Law, Ordinance regarding the enlistment of workers. Policemen either help factory or mine inspectors or directly handle matters mentioned in these laws. Labour movements and disputes many times call for the use of police power.

Police Stations and Officials

At the end of 1933 there were 1,199 police stations, 24 water-police stations, 4,551 branch stations, 14,056 police-boxes.

At the same time there were 52 chiefs of police divisions, 339 police-superintendents, 1,632 police inspectors, 3,604 assistant police inspectors, 59,835 police sergeants and policemen, total being 65,462.

EXPENDITURES FOR POLICE BUSINESS

CHAPTER XXVIII

EDUCATION

Historical Background

Chinese letters and Confucian books were first introduced to Japan in the third century, and it was then that the civilization of the country made a real start. From the nearby peninsula of Korea came sericulture, weaving, brewing, and the art of the blacksmith. It was about this time that the Imperial Prince Wakairatsuko established a Court School.

In the sixth century Buddhism came to the Island Empire to give added material progress to the Japanese civilization, and in 607 the Imperial Prince Shotoku-taishi (see Chapter III) caused the Horyuji Temple to be built at Nara and there he established a school in the temple. These were the earliest schools of Japan.

In the latter half of the seventh century a college in the capital and some provincial schools were established to educate officials, according to the Taiho Laws. Later, in the Heian Age, the courses of study became encyclopædic and both public and private schools were established. In the Muromachi Age school education suffered a decline and only two places of study were recorded, namely, the Kanazawa Library and Ashikaga School, although there might have been private lecture halls kept secretly by scribes and Buddhist monks.

The Tokugawa Shogunate encouraged the study of Confucianism and several schools of this moral system and Chinese philosophy were introduced, and education extended to the common people. There were established many schools; the highest one was called the Shohei Hill Academy or Shohei School, which was established by the Shogunate. The central government had many other schools, while each local clan government also had its own schools. In addition to these, private schools and "tera-koya" appeared all over the country for the education of the people in general.

"Tera-koya" Education

The "tera-koya" needs some special explanation, as it played the most important part in the education of the masses before the Meiji Era, and laid the foundation for the remarkable progress of elementary education in new Japan which has surprised the world.

The word "tera" means Buddhist temple and "koya" children's house, so the tera-koya was a school for children established by a Buddhist temple. It was originated many years before the time of the Tokugawa Shogunate by Buddhist monks, but at first it was rather for the privileged class of people and the number of these schools was limited. The orderly system of national politics of the Tokugawa Shogunate inaugurated an age of peaceful life for all classes of the people, and civilization and culture made unusual progress. Side by side with the governmental schools for the samurai class, tera-koya education spread among the common folks in business and farm quarters. It gradually ceased to be entirely in the hands of the monks, and assum-

Digitized by Google

ed a form and nature quite different from the original.

The school-house was no longer in or attached to a temple; teaching was not restricted to the monks; the teacher might be a samurai, monk, doctor or Shinto priest. "Tera-koya" became merely a general name, and the founders of tera-koya schools chose any name they liked for their own. The size of the schools was diverse, the largest one accommodating as many as two or three hundred pupils. There was rarely more than one teacher, but in the larger schools there might be an assistant. The age of the pupils ranged from 6 to 15 years. It was co-education, although the sexes sat apart. The courses of study were commonly penmanship, Japanese literature, and the use of the abacus, with such optional subjects as Chinese literature, poem compositon, sewing, flower-arrangement or tea ceremonies. Many textbooks on moral precepts and letter writing were published and used in these schools. These schools were usually kept up largely out of the pocket of the school master himself, for his work was entirely voluntary, inspired by pure devotion to service, for which he gained the honour and respect of the community. According to the report of the Department of Education, there were 15,862 tera-koya in Japan at the beginning of the Meiji Era, or just before the establishment of the new elementary school system. No wonder that the rate of school attendance falls little short of 100%, although it is compulsory now.

It must be remembered also that technical schools had made considerable progress in old Japan. Medical schools in particular were established in the Taiho Era, and medical science made steady progress toward the middle of the Yedo Age. The Tokugawa Shogunate established a medical school in 1765, and local clan lords followed this example. There were several private ones well known to the people. But these taught the Chinese method of the science, and the "materia medica" was almost entirely of herbs and animal matter. The modern or Western medical science and its system and practice were introduced through Dutchmen at the end of the Yedo Era, so we may say that medical science was the earliest of all the sciences that were learned by the Japanese people from the Westerners.

Educational Administration

The present educational system of Japan dates from 1872, the 5th year of Meiji, when elementary education was made compulsory. Its principles are stated in the Imperial Rescript on Education issued on Oct. 30, 1890. This world-renowned rescript was published to lay down leading ideas and principles for the guidance of the Japanese, and it reads as follows:

"Know ye, Our Subjects!

Our Imperial Ancestors have founded Our Empire on a basis broad and everlasting and have deeply and firmly implanted virtue; Our subjects, ever united in loyalty and filial piety, have from generation to generation illustrated the beauty thereof. This is the glory of the fundamental character of Our Empire, and herein also lies the source of Our education. Ye, Our subjects, be filial to your parents, affectionate to your brothers and sisters; as husbands and wives be harmonious, as friends true; bear yourselves in modesty and moderation; extend your benevo-

Digitized by Google

lence to all; pursue learning and cultivate arts, and thereby develop your intellectual faculties and perfect your moral powers; furthermore, advance the public good and promote common interests; always respect the Constitution and observe the laws; should any emergency arise, offer yourselves courageously to the State; and thus guard and maintain the prosperity of Our Imperial Throne, coeval with heaven and earth. So shall ye not only be Our good and faithful subjects, but render illustrious the best traditions of your forefathers.

The way here set forth is indeed the teaching bequeathed by Our Imperial Ancestors, to be observed alike by Their Descendants and subjects, infallible for all ages and true in all places. It is Our wish to lay it to heart in all reverence, in common with you, Our subjects, that we may all thus attain to the same virtue."

The 30th day of the 10th month of the 23rd year of Meiji.

(Imperial Sign Manual)

(Imperial Seal)

All school education in Japan is supervised by the State, being partly entrusted to local public bodies such as the prefectural councils, towns and villages.

Private individuals are also allowed to found schools and universities, although here too the Government does not give much latitude of method or scope, and the uniformity of school education in all parts of the Empire has worked well in bringing the degree of advancement in modern ways and thought to almost the same level throughout the land, and greatly strengthening the national spirit and unity of the people.

The points entrusted to local public bodies are chiefly financial matters, pertaining to the establishment and maintenance of schools, some of which are obligatory while some are left to the discretion of local bodies. The obligatory matters are the establishment by Hokkaido and the prefectures of normal schools, middle schools for boys and girls, schools for the blind and for the deaf-and-dumb, technical schools by order of the Minister of Education, and that of ordinary elementary schools by cities, towns and villages. Municipalities may not establish higher normal schools, and Hokkaido and the prefectures alone are authorized to establish universities, higher schools and normal schools.

The main principles regarding the nature and objects of schools, their scholastic terms, curricula, organizations, entrance qualifications, qualifications for the teachers, equipment, means of meeting the expenditure, and tuition fees are prescribed by Imperial Ordinances. The establishment of schools by public bodies or private individuals must be approved by the local supervising authorities, which also exercise control to a certain extent over their methods of education and finances.

Religion is, on principle, excluded from the educational agenda of schools. In all schools established by the Government and local public bodies, and in private schools whose curricula are regulated by laws and ordinances, it is forbidden to give religious instruction or to hold religious ceremonies either in or out of the regular curricula.

Education in the colonies comes under the control of the colonial governments, and the military schools belong to the War and the Navy Departments, while there are some technical schools which come

Digitized by Google

under the supervision of other Departments. But with these exceptions, it may be safely said that the Minister of Education has charge of all matters relating not only to school education, but also to what may be termed social education, such as art, science, literature and religion. He is assisted by the parliamentary councillor in the conduct of political affairs and in matters which are connected with the business of the Imperial Diet. The vice-minister assists him in the business part of the Department.

Of the affairs within the jurisdiction of the Department, those that are related to education, art, science, and literature are distributed respectively among the Bureaux of Higher Education, General Education, Technical Education, Social Education, School Books, and Student Control, and those pertaining to religion are under the direction of the Bureau of Religion. Those affairs which do not properly belong to any one of these bureaux are dealt with in the Minister's Secretariat. In addition there are school superintendents, who inspect schools and directly supervise educational affairs; supervisors of social education who direct and supervise social educational affairs; superintendents of compilation who compile and examine text-books; and supervisors of school hygiene who look after the sanitary conditions of schools. Various advisory committees with prominent men in and out of office as members are instituted to help the Minister of Education in matters of wider scope.

The Minister of Education is authorized to direct and supervise the Superintendent of the Metropolitan Police and the local governors in matters under his control.

The prefectural governors direct and supervise their subordinate officials and exercise supervision over the public and private schools, kindergartens and libraries within their jurisdictions. There is a Division of Educational Affairs in each prefecture which has control of matters relating to education. School inspectors and sub-inspectors in it inspect schools and conduct educational business directly.

The mayors of cities and towns and the heads of villages deal with affairs regarding elementary schools and exercise control over them. The mayors of cities, moreover, have authority to make recommendations to prefectural governors in the appointment of the principals and teachers of elementary schools. The municipalities have school boards to look after elementary schools.

School Education

As is shown in the following tables, Japan is well provided with schools, ranging from kindergartens up to universities. Almost all the elementary schools are controlled by public bodies.

Conditions are different when we come to secondary education, for which there exist a considerable number of private schools, and in the case of schools of the highest grade the private establishments quite outrange in number those under official control.

Only 17 out of the 46 existing universities were built by the Government, 5 by public bodies and the rest by private bodies.

The total number of schools in Japan proper and their enrolment in the last five years, 1928-1933, is shown below:

Year	Schools	Students
1933	45,793	13,408,971
1932	45,766	13,073,854
1931	45,898	12,847,730

Digitized by Google

Year	Schools	Students
1930	45,803	12,549,320
1929	45,610	12,287,660

Classified according to types, the number of schools in Japan proper in the year 1933, with the number of students enrolled, was as follows:

	Schools	Students
Elementary Schools	25,697	10,714,196
Middle Schools	558	329,459
Girls' High Schools	963	361,739
Business Schools	1,024	298,893
Business Continuation Schools	15,091	1,270,874
Higher Schools	32	20,589
Universities	47	70,162
Colleges	116	67,341
Higher Trade and Industrial Colleges	54	22,546
Normal Schools	103	36,867
Higher Normal Schools	2	1,790
Higher Normal Schools for Women	2	839
Special Institutes for the Training of Teachers	4	154
Institutes for the Training of Business School Teachers	4	371
Institutes for the Training of Business Continuation School Teachers	42	1,039
Schools for the Blind	78	4,613
Schools for the Deaf and Dumb	59	4,376
Miscellaneous Schools	1917	203,123
Total	45,793	13,408,971
Kindergartens	1,708	129,001
Young Mens' Training Institutes	15,546	835,723

The figures for schools refer to those existing on March 31, while the figures for students refer to those on March 1.

Elementary Education

Elementary education in Japan is compulsory and has attained to its present high level of excellence through many improvements since the promulgation of the School Ordinance in 1872. In the Imperial Ordinance relating to Elementary Schools the object of elementary education is defined as follows:

"Elementary schools are designed to give children the rudiments of moral education specially adapted to make of them good members of the community, together with such general knowledge and skill as are necessary for the practical duties of life, due attention being paid to their bodily development."

According to the system of compulsory education all children from 6 to 14 years of age are called school-age children, and those who exercise parental authority over them, or their legal guardians, must send them either to the ordinary elementary schools established by the cities, towns or villages until they complete the required course of study, or to schools established by the Government, prefectures or by private individuals, recognized as equal to the ordinary ones above mentioned. The law is not enforced when a child is unfit for study owing to physical or mental deficiency or cannot be sent to school by reason of extreme poverty. There is a provision which requires the employers of school-age children to see that the work imposed does not interfere with their going to school.

The responsibility of establishing ordinary elementary schools is placed upon cities, towns and villages, and they are making efforts to maintain schools even in the dire depression of the past few years. At the same time, however, special provisions permit the State Treasury to bear part of the expense, and the diffusion of elementary school education in Japan proper is all but ideal, the number of the school-age children attending schools maintaining the rate of 99% for the past five years.

The full figures are as follows:

These figures represent the condition existing on March 31 of the respective years.

Digitized by Google

Year	School-age Children	Children Attending Schools	Children not Attending Schools	Percentage of Children Attending Schools
1933	10,754,962	10,708,930	46,032	99.57
1932	10,392,794	10,344,642	48,152	99.54
1931	10,105,941	10,056,530	49,411	99.51
1930	9,883,785	9,832,847	50,938	99.48
1929	9,717,057	9,663,586	53,471	99.45

Elementary schools are divided into two grades, namely, ordinary or lower and higher. The former are for the beginners and their course extends over six years. The latter are for those who have completed the lower course, and their courses are of two or three years' duration. The subjects taught are morals, Japanese language, arithmetic, Japanese history, geography, science, drawing, singing, sewing (for girls only) and gymnastics. In the higher courses, either one or more subjects out of handicraft, agriculture, industry, commerce and domestic science (for girls only), are added, and if local circumstances make it advisable, handicraft in ordinary elementary schools and foreign languages and other useful subjects in higher elementary schools may also be taught.

An elementary school may comprise both the ordinary and the higher elementary school courses and may equip itself with a supplementary course of not more than two years.

Under the present system of compulsory education the father's responsibility ends when his child has graduated from the lower elementary school. But the ordinary elementary education of children is not sufficient for the existing conditions of society, and many cities, towns and villages establish higher elementary schools either independently or in connection with ordinary ones. For the same reason, many business continuation schools are established to give elementary school graduates such education as may be of use in various trades.

The following table will give a general idea of the conditions of elementary schools as they were in 1933.

Schools	Governmental	Public	Private	Total

Teachers and Salaries There are more male teachers than female in the Japanese elementary schools, and they are classified according to their education and special abilities, as (1) elementary school teachers (2) lower elementary school teachers, (3) teachers on special subjects, (4) assistant teachers, and (5) substitute teachers. The teachers belonging to the first two classes are regular teachers properly qualified for the elementary education of children.

ELEMENTARY SCHOOL TEACHERS CLASSIFIED

(March 1, 1933)

Ordinary Elementary Schools	Male	Female	Total
Regular teachers	112,074	53,329	165,403

Secondary Education

For the secondary grades there are middle schools for boys, girls' high schools, business schools and business continuation schools.

Middle Schools The course of the middle school extends over five years, and its object is to give boys such a higher general education as will fit them to be useful members of society after their graduation. The subjects taught are morals, civics, the Japanese language and Chinese classics, history, both Japanese and foreign, geography, a for-

Digitized by Google

eign language (either one of English, German, French or Chinese), mathematics, science, technical studies, drawing, music, practical work (carpentering, gardening, etc.) and gymnastics.

From the fourth year upwards, the subjects are selected and arranged into two groups, the pupils making choice between the two. Under special circumstances, however, the Minister of Education may authorize a school in which either of the two groups may be dispensed with. This dual system of curriculum is of benefit on the one hand to the pupils who wish to take up employment immediately upon graduation, and on the other to those who wish to advance to higher-grade schools.

To the regular course a supplementary course of one year or less may be added, and, if local circumstances require, a preparatory course of two years may also be provided. A boy who desires to enter a middle school must complete either its preparatory course or the full course of an ordinary elementary school. Those who are twelve or more years of age and in possession of adequate scholastic attainments may be admitted upon examination. Those who have completed the fifth year (the course of the ordinary elementary school ends with the sixth year as mentioned above) of an ordinary elementary school and are physically well developed and have shown excellent scholarship are allowed to apply for the entrance examination, even though under twelve years of age; this is to give a chance to specially gifted boys.

The following are the figures for middle schools and their pupils on March 1 of each year:

Year	Schools	Pupils
1933	558	329,459
1932	558	336,186
1931	557	345,691
1930	555	348,584
1929	546	343,709

A general idea of the condition of the middle schools in 1932-1933 may be obtained by the following table of figures:

	Governmental	Public	Private	Total
Schools	2	435	121	558

Girls' High Schools The system of high schools for girls is made flexible to suit practical requirements. A girl who has completed elementary school or has equivalent scholastic attainments and is twelve years or more of age may be admitted to a girls' high school. The course of the girls' high school extends over four or five years, and those schools whose entrance requirement is the completion of the higher elementary school or the possession of the same or higher scholastic attainments are allowed to shorten their course to three years. There is another kind of girls' high school which is called Girls' Domestic High School, where domestic science is the main course of study, and its regular course extends over two to four years. Girls who wish to take only one part of the course are allowed to do so on application. A supplementary course of two years or less may be provided for the benefit of those who wish to continue their study after completing the regular course, and a post-graduate course or a higher course of two or three years for the purpose of giving higher education. In the cases of the higher course, higher qualifications are required of the teachers and its standard is brought up almost to that of the higher school for boys.

The subjects taught in a girls' high school are the same as those taught in the middle schools, but with the addition of domestic science and sewing, the required hours of study being from 28 to 29 a week. In the case of the Girls' Domestic High School, technical study is added and the hours for domestic science and sewing are double those of the ordinary high school, the time allowed for other subjects being shortened, and foreign languages omitted altogether. Under special circumstances the foreign language, drawing and music may be omitted, and if local circumstances require, pedagogics, manual arts, technical studies and other useful subjects may be taught in addition to the normal curriculum. In such cases the total weekly hours may be increased to a little over 30. The curriculum of a domestic course of three years, the entrance requirement of which is the completion of the first year of the higher elementary school, is to be suitably drawn up on the basis of that of a domestic course of two years, the entrance requirement of which is the completion of the higher elementary school, and be submitted to the Minister of Education for approval.

The progress of female education is phenomenal in modern Japan and girls' high schools have taken very marked strides in recent years both in number and quality. At the end of March, 1932, there were 980 girls' high schools in Japan proper, many of them being provided with, or contemplating the provision of, a post-graduate course or a higher course.

The number of schools and girl students on March 1 of each year was as follows:

Year	Schools	Girls
1933	968	361,739
1932	980	362,625
1931	975	368,999
1930	970	367,726
1929	940	359,289

Business Schools Business schools of secondary grade are established for the purpose of giving young people the practical knowledge and skill necessary in various vocations, and much is left to the discretion of the founders as to the systems of schools in order to suit the special needs of different industries, trades and localities. The courses may extend from two to five years according to the nature of the school. A period of not longer than one year may be added to the maximum prescribed course. Further provisions are allowed to meet the needs of those who desire to take only a part of the curriculum, for those who, after completing the prescribed course, still desire to remain for further study, and for those who wish after completing the course of a middle school or girls' high school, to enter a business school with the object of receiving business education; and lastly for those who wish to receive instruction in a simple way for only a short period.

On March 1, 1933 there were 1,024 business schools. The figures for the years 1929-1933 are given below:

Year	Schools	Pupils
1933	1,024	298,893
1932	1,003	292,015
1931	975	288,681
1930	957	280,904
1929	911	267,041

Business schools are divided into two classes, A and B. Those schools which belong to A class admit boys and girls who have completed the course of the ordinary elementary school, while those which belong to B class admit those who have completed the course of the higher elementary school. And they are of six kinds, namely, Technical, Agricultural, Fisheries, Commercial, Navigation and Practical. Figures relating to these business schools in 1932-1933 are given below.

BUSINESS SCHOOLS (A)

	Schools	Teachers	Pupils	Graduates	Applicants	Admitted	Left school
Technical	93	2,265	33,553	6,892	19,594	9,698	1,958

Digitized by Google

Of these schools, 13 technical, 14 agricultural, 133 commercial, and 126 practical schools were under private management.

According to the report of the Business Education Bureau, Ministry of Education, the number of business schools on April 20, 1934, was 1,025 and that of students 342,299; (a) 821 schools with 303,537 students, (b) 206 schools with 38,762 students. Of the total, 294 schools were established by private bodies or individuals, where students numbered 100,011.

Business Continuation Schools The object of these schools is to give to boys and girls engaged in vocations after graduation from the ordinary elementary school useful knowledge and skill relating to these vocations and at the same time to furnish education necessary in daily life. Their courses are technical, agricultural, commercial, navigation, fisheries and sewing; each school providing one or even all of these. The whole course is divided into two terms, the first extending over two years and the second over two or three years according to the nature of studies. The number of hours taught in a year ranges between 200 and 420 in the first term, and 160 and 420 in the second, according to studies and the grade of the class. Those who have completed the ordinary elementary school or are up to that standard may be admitted to the first term, and those who have completed the course of the first term and the higher elementary school or are up to the same standard may be admitted to the second term.

A business continuation school may, if local circumstances require, provide itself only with the first or the second term. It may give further instruction to those who have completed the second term. Under special circumstances, a business continuation school of higher grade may be established for the purpose of giving specialized teaching.

The number of business continuation schools and that of their pupils for the years 1929-1933 were as follows:

Year	Schools	Pupils
1933	15,091	1,270,874
1932	15,083	1,271,971
1931	15,248	1,277,338

Higher Education

The institutions for higher education are higher schools, universities, colleges, and higher trade and industrial colleges.

Higher normal schools, institutions for training teachers of higher education, post-graduate or supplementary courses in secondary educational institutions and higher grade classes of the special educational institutions are mentioned under other headings, though they might be included here with the other higher educational organs.

The number of schools under this heading, higher normal schools and teachers training institutions and that of students on March 1 of each year follow:

Year	Schools	Students
1933	261	183,792
1932	254	183,809
1931	258	183,952
1930	254	179,038
1929	243	170,154

Higher Schools (Koto Gakko) The higher school is primarily an institution whose object is to complete the general education of young men. But it is as a matter of fact a preparatory school for universities or higher trade and industrial colleges in present-day Japan. No women are admitted. It is divided into two courses, the higher and the lower. The former extends over three and the latter over four years, making seven in all. A post-graduate course of one year may be taken after the higher course. Some schools have the higher course alone. On May 30, 1933, the higher schools with the higher course alone numbered 24, while those with both lower and higher courses numbered 8.

The entrance requirements for the lower course are practically the same as those for the middle schools. The higher course is divided into the literature and science courses and a candidate must be one who has completed the lower course of the same school or one who has completed the fourth year of the middle school or whose scholastic attainments are equal or superior to the same standard.

There are about the same number of preparatory courses of universities which correspond to higher schools and are directly attached to universities. The following figures for 1932-1933 refer to the higher schools only.

Digitized by Google

HIGHER SCHOOLS
(1932—1933)

Schools	32
(Schools which have lower course)	(8)
Teachers	1,266
Lower Course	149
Students	18,150
Lower Course	2,489
Graduates	5,506
Lower Course	543
Applicants	32,236
Lower Course	3,460
Entrants	5,665
Lower Course	615
Left School	678
Lower Course	68

Of the 32 schools, 25 are governmental, 3 public and 4 private.

Universities A university (Daigaku), in its regular form, consists of several faculties, but a single faculty may also constitute a daigaku. Each faculty is required to have a post-graduate course, and in those universities which include several faculties a university hall may be established for keeping the various post-graduate courses in touch with one another. Under special circumstances a preparatory course may be provided.

Admission to a university is extended to the graduates from higher schools and from preparatory courses of its own, and to those who have the same scholastic attainments. When a student has studied in the university for three years or more (four years or more in the faculty of medicine) from the date of his entrance, and has passed a prescribed examination, he may assume the degree of "Gaku-shi" (lit. "learned gentleman") or Bachelor. He is also qualified to enter the post-graduate course. In many universities facilities are provided for those who wish to pursue studies only in some particular subjects according to prescribed regulations.

A university is authorized to confer a doctor's degree on persons who have pursued studies for a period of two years or more in the post-graduate course and whose theses have been approved by the faculty council. Those who have not pursued studies in the post-graduate course may also submit theses and apply for doctor's degrees. The degree is conferred when the faculty council is satisfied with the theses.

The oldest of the 46 universities is Tokyo Imperial University, which was founded in 1886. Keio-Gijuku and Waseda were founded much earlier, but they were raised to the present standard in 1920 according to the ordinances enacted at that time.

Of the total number of students and pupils, that of regular university students was 46,975 and that of pupils in the preparatory course or elective courses was 23,187.

The following figures as they stood on March 1, 1932 and 1933 show the number of students in these universities classified according to faculties.

	1933	1932
Post graduate course	2,071	2,069

Tokyo Imperial University

To give an idea of Japanese universities the following information on Tokyo Imperial University is given here.

The university is situated in Hongo, Tokyo, occupying about one hundred acres. It fell a victim of the quake-fire of 1923, and one-third of the total floor space of the entire

Digitized by Google

buildings was thrown out of use, while the remainder had to be repaired.

Besides ¥2,000,000 appropriated by the Government for immediate emergencies, the extraordinary session of the Diet held in the summer of 1924 made a grant of over ¥40,000,000 to enable the university to complete reconstruction in about 15 years. At present the restoration of all buildings, books, equipments is nearing completion.

History In 1854 the Tokugawa Shogunate opened the Yogaku-sho or an institute for foreign learning. The name of the institution was changed several times; for instance, the Kaisei-gakko in 1868, the Daigaku-nanko in 1869, the Tokyo Kaisei-gakko in 1874. Another institute was opened by the Tokugawa Shogunate in 1857, which was called the Shuto-kwan or an institute for vaccination. This in time developed into a medical school and became known in 1874 by the name of the Tokyo I-gakko or Tokyo Medical School. In April, 1877, the above two institutions were merged into one institution, known by the new name of the Tokyo Daigaku or Tokyo University. A little later the Tokyo Law School and the Technical College were united with it under the name of the Imperial University in March, 1886. The university had five faculties: law, medicine, engineering, literature, and science. The Tokyo Agricultural and Forestry School was incorporated into it in 1890, and in June, 1897, the university assumed its present name of Tokyo Imperial University.

Organization The university is a State institution and is organized in accordance with the Government's requirements for a university. It is composed of 7 faculties: law, medicine, engineering, literature, science, agriculture, and economics.

Besides the 7 faculties above mentioned there is a library in connection with the university. Hospitals and Dispensaries are connected with the Faculty of Medicine. An Institute for Historical Compilation is a part of the Faculty of Literature. Connected with the Faculty of Science are the Botanical Garden and the Marine Laboratory. Forests, farms, and the Institute for the Training of Agricultural School Teachers, are connected with the Faculty of Agriculture.

The Institute for the Study of Infectious Diseases, the Institute of Aeronautics, the Tokyo Astronomical Observatory, and the Earthquake Research Institute are also institutions attached to this university.

The Faculty of Law includes the 2 courses of law and politics, with 34 professorial chairs. The Faculty of Medicine includes the 2 courses of medicine and pharmacy, with 35 professorial chairs. The Faculty of Engineering includes the 10 courses of civil engineering, mechanical engineering, naval architecture and engineering, aeronautics, technology of ordnance, electrical engineering, architecture, applied chemistry, technology of explosives, mining and metallurgy, with 58 professorial chairs. The Faculty of Literature includes the 19 courses of Japanese literature, Japanese history, Chinese philosophy, Chinese literature, Oriental history, Occidental history, philosophy, Indian philosophy, psychology, ethics, theology and history of religion, sociology, pedagogics, esthetics and history of fine arts, philology, Sanscrit literature, English literature, German literature, and French literature, with 41 professorial chairs. The Faculty of Science includes 10 courses of mathematics, astronomy, physics, chemistry, zoology, botany, geology, mineralogy, geography, and seismology, with 41

Digitized by Google

professorial chairs. The Faculty of Agriculture includes the 6 courses of agriculture, agricultural chemistry, forestry, veterinary medicine, fishery, and agricultural economy, with 42 professorial chairs. The Faculty of Economics includes the 2 courses of political economy and commerce, with 17 professorial chairs.

Those of adequate learning, aged 19, or above, who are desirous of attending the lectures or experiments for one or more subjects prescribed in the faculty courses, may be admitted as elective pupils in the Faculties, but only when there are vacant seats.

Auditors may be admitted to the faculties on application, when the study of the students is not inconvenienced by their presence. They must conform with the conditions prescribed by the faculties, unless they are entrusted by the Japanese or foreign governments. In addition, there are practical courses of agriculture, forestry, and veterinary medicine in connection with the Faculty of Agriculture. Applicants for admission must be graduates from middle schools, or those who are recognized as having equal attainments.

Students who remain in one course for more than 6 years (in the course of medicine, 8) are struck off the school roll. The practical courses in the Faculty of Agriculture run for 3 years.

The period for scientific research by students in the University Hall is fixed at 2 years. If their research necessitates the prolongation of this period, the President may permit it, on their application, to the extent of 5 years. They are under the control of the dean of the faculty whose curriculum they follow. As to their teacher or teachers, the faculty concerned decides.

The university officials are the president, 234 professors, 156 assistant professors, 3 secretaries, 1 administrative official, 5 officials for student affairs, 2 librarians, 284 assistants and 29 minor officials.

In May, 1934 the number of students was 8,050 in all. Post graduate students were: law 71, medical 22, technical 28, literature 374, science 97, agricultural 56, and economics 28. Under-graduate students were: law 2,358, medicine 694, technology 1,039, literature 1,284, science 351, agriculture 1,034, and economics 1,290.

Tuition is ¥120 a year for under graduates and ¥75 for post graduates.

Annual salary of the professors is from ¥1,130 to ¥4,050 besides the stipend attached to a chair from ¥500 to ¥1,600.

The Budget The budget for the fiscal year 1935-1936 is as follows:

REVENUE

Ordinary	
From the Government	¥3,728,852
For business teachers' training	39,783
Miscellaneous income	4,070,520
Total	7,839,155
Extraordinary	
From the Government	120,000
From University forestry	83,460
From the Endowment Fund	795,817
Contributions	80,000
Total	1,079,277
Total revenue	8,918,432

EXPENDITURE

Ordinary	
Salary	¥2,174,305
School disbursements	5,210,401
Salary of foreign professors	71,322
Pension allotment	375,374
Miscellaneous	7,753
Total	7,839,155
Extraordinary	
Buildings and repairs	811,629
Equipment and others	267,648
Total	1,079,277
Total expenditure	8,918,432

University Library Before the 1923 quake-fire the library contained ap-

Digitized by Google

proximately 700,000 volumes of books, but most of them were destroyed by the disaster. In order to make the loss good Marquis Yorimichi Tokugawa offered the university the whole of his Nanki Library with its precious collection of about 100,000 volumes, mostly Japanese and Chinese books. Contribution of books from nations of the world of over 325,000 volumes followed. The cases of books received from the British Committee for collecting English books financed by the British Government amounted to 271 in 1932. Gifts of books from all parts of the Empire amounted to 220,000 volumes, including those of the Nanki Library. The acquisition of books by purchase, including those bought with the Government Fund and the Rockefeller Fund reached over 495,000 volumes.

In December, 1924, Mr. John D. Rockefeller, Jr. of New York offered a fund of ¥4,000,000 for the reconstruction of the library. The plan of the new library was completed in 1925 and the building in November, 1928. The building is fire-proof and earthquake-proof, and has a floor-space of 5,100 tsubo. The largest reading room contains seats for over 1,200 persons. The number of books now exceeds 1,000,000 volumes.

Summary of Doctor's Degrees The following is a summary of doctor's degrees awarded during the past 46 years, or from May, 1888 to the end of 1934.

Colleges, and Higher Trade and Industrial Colleges "College" is the usual translation of the Japanese "Semmon Gakko" or Speciality School, but they are very different from colleges among Western nations and are organs for training the young people in some kind of professional studies.

The required length of the course of a college is three years or more. For admission to an art or music school, the completion of the third year of the middle school or the girls' high school or the possession of equal or higher scholastic attainments is required, while for admission to all other colleges the completion of the course of the said second grade schools or similar or higher scholastic attainments is required.

In March, 1933, there were 116 colleges, 8 of them being founded and maintained by the Government, 9 by public bodies and the rest by private bodies. They may be classified as follows according to their nature:

Other Education

Besides the schools stated above, there are kindergartens, schools for the blind, schools for the deaf and dumb, and miscellaneous schools.

Kindergartens Kindergartens are found chiefly in larger towns. With

Digitized by Google

general social progress, however, the necessity of their improvement and diffusion being greatly felt in spite of the recent financial depression, an Imperial Ordinance for Kindergartens has lately been issued to encourage their further development. Kindergartens receive children from 3 years of age to school age or full six years of age.

The following table gives the number of kindergartens and that of children attending in the years 1929-1933 :

Year	Kindergartens	Children
1933	1,708	129,001
1932	1,622	126,564
1931	1,510	121,975
1930	1,397	114,749
1929	1,294	107,236

Education for the Blind and the Dumb It has been the educational policy of the Japanese Government since the beginning of the Meiji Era that there shall be no illiterates in the country. Therefore, even persons with physical defects are admitted to elementary, middle or girls' high schools, provided that they are fit to attend a greater part of the lessons. But boys and girls who are blind or deaf and dumb are encouraged to enter schools specially founded for them. A special ordinance relating to the schools for the blind, and schools for the deaf and dumb has lately been issued for the purpose of perfecting their elementary and secondary education. The following table gives the number of them and that of their pupils in the years 1929-1933.

Year	Schools	Pupils	Blind	Deaf & Dumb
1933	137	8,939	4,613	4,326
1932	136	8,694	4,550	4,144
1931	125	8,137	4,306	3,831
1930	122	7,728	4,088	3,640
1929	119	7,232	3,768	3,464

Miscellaneous Schools Under the heading of "Miscellaneous Schools," the Japanese Government includes for convenience' sake all schools which do not fully come into any definite category of schools under the provisions in the laws and ordinances.

The following table gives the number of miscellaneous schools and that of their pupils in the years 1929-1933 :

Year	Schools	Pupils
1933	1,917	203,123
1932	1,935	196,903
1931	1,932	217,257
1930	1,879	228,512
1929	1,795	227,104

Since the establishment of miscellaneous schools is left to the discretion of the founders, there can be no uniformity as to the courses and subjects of study. Some aim at simple and quick completion, while some keep high standards and their work is equivalent to or even higher than that of colleges mentioned in the foregoing passages. Some, again, resemble the middle school, the girls' high school, or the technical school. Among miscellaneous schools, there are not a few which are to be highly estimated as educational institutions in their ideals and new methods of education. Many of the Christian schools are included among them.

New Educational Movements The educational system of Japan is so complete, as is specially the case with primary school education, that there has been hardly any room for such free educational movements as in Europe and America. The progress in other lines of national life, however, naturally stimulated the awakening of scholars and practical educators towards the end of the Meiji era. The development of major cities presented a large field for the

Digitized by Google

experiment of new educational work. Influenced by Western thoughts and guided by scholars who gave expositions on European and American educational thoughts so as to adapt the characteristic environments in Japan, many new schools have been established in Tokyo and Osaka. Their scope of influence as well as their number is limited, and the new movement, which is more or less radical, is going through difficult times owing to the reactionary tendency in these years; but the existence of such schools as Mrs. Masako Yoshano's Bunka-gakuin, Mrs. Motoko Hani's Jiyu-gakuen, and Mr. Kuniyoshi Obara's Seijo-gakuen proves the demand for and appreciation of new education among the more advanced quarters of urban population. The new educational movement among primary school teachers must not be overlooked. Their curriculum cannot deviate very much from that fixed by the government, but their efforts for handling materials so as to adapt the local environment of the pupils and to take in the projective method are bringing about good results. The representative schools are Tajima Primary School in Kawasaki, Urashima Primary School in Yokohama, etc. Primary schools of a similar kind may be found in many places throughout the country.

Training of Teachers

The Japanese Government, alive to the necessity of having a large supply of capable teachers, has spared no efforts in the completion of organs for their training. To give an outline of the present system, Hokkaido and the prefectures are called upon to establish and maintain at least one normal school each, and an institution for the training of business continuation school teachers when circumstances make it necessary, a responsibility which is also imposed on the cities. The Government itself undertakes the training of teachers of normal schools, middle schools, girls' high schools and technical schools by establishing and maintaining higher normal schools, higher normal schools for women, special institutes for the training of teachers, etc., and the students of these schools are given scholarships, covering part of their expenses, either by the Government or by the local public bodies. Moreover, such of the students of universities, colleges and the like as intend to become teachers, receive aid out of public funds or may be exempted from the payment of fees. Persons who have proved themselves deserving extended aid are chosen for studying abroad in order that they may be better qualified to teach higher arts and sciences.

The following table gives the number of schools for training teachers and that of their students in the years 1929-1933:

Year	Schools[1]	Students
1933	157	41,060
1932	167	44,609
1931	175	49,226
1930	178	53,308
1929	174	54,963

Organs for Training Elementary School Teachers The principal organs for training elementary school teachers are the normal schools, while the training course B grade of the Tokyo Academy of Music trains music teachers for elementary schools.

A normal school consists of the regular and the post-graduate courses, the former is divided into the first and second sections. The course of study of the first section extends over five years and it takes

1 Note: There are 2 colleges and their students are included in this as well as in the number of the table on colleges.

Digitized by Google

in the graduates of higher elementary schools of a two years' course or persons of over 14 years of age who have similar attainments. The course of study of the second section runs for two years and it takes in graduates of middle schools, girls' high schools and persons of similar scholastic attainments.

The following table gives the number of normal schools and that of their students and graduates in the years 1929-1933 :

Year	Schools	Students	Graduates
1933	103	36,867	12,611
1932	104	38,868	11,033
1931	105	43,852	15,524
1930	105	47,444	16,895
1929	104	48,930	18,128

Organs for Training Teachers for Secondary Education As organs for training the teachers of secondary education, there are the higher normal schools, higher normal schools for women, special institutes for training teachers, the training course in drawing of the Tokyo Academy of Fine Arts and the training course, grade A of the Tokyo Academy of Music. The systems differ more or less with the schools or the main subjects taught, but their entrance requirements are, generally speaking, the completion of middle school, girls' high school and normal school, or the possession of the same or higher scholastic attainments, and their courses extend over four, three or two years, with additional post-graduate and special investigation courses.

The following table gives the number of the schools for the training of secondary school teachers and that of their students and graduates in the years 1929-1933 :

Year	Schools	Students	Graduates
1933	10	4,421	925
1932	15	4,245	—
1931	20	4,747	—
1930	22	4,189	—
1929	21	4,432	—

In addition to the foregoing, teachers' certificates are issued without examination to graduates of high grade schools both in Japan and in other countries in order to meet the deficiency in the supply of secondary school teachers. The main conditions are that the schools in question must be equal to or higher than the higher normal schools of Japan in entrance requirements and in curricula. Including those who passed examination there were 10,840 persons who received such certificates in 1932-1933.

Organs for Training Business School Teachers For the purpose of training teachers of practical subjects in technical schools, institutes are attached to the Government universities and colleges. They are of a three year course, the scholastic standard corresponding to that of the colleges.

The following table gives the number of such institutes and that of their students and graduates in the years 1929-1933 :

Year	Agricultural		Technical		Commercial		Total		
	Schools	Students	Schools	Students	Schools	Students	Schools	Students	Graduates
1933	1	116	2	150	1	105	4	371	113
1932	1	121	2	150	1	103	4	374	116
1931	1	117	4	151	1	97	6	365	113
1930	1	120	4	157	1	96	6	373	120
1929	1	89	2	162	1	90	4	341	123

Digitized by Google

As further means of providing business school teachers, certificates are issued without examination to graduates of certain specified schools. Including those who passed examination the number of persons who received such certificates in 1932-1933 was 410.

Organs for Training Teachers of Business Continuation Schools For this purpose there are institutes which Hokkaido, the prefectures and cities alone are authorized to establish. They are of one or two year courses above the secondary education. The following table shows the number of these institutes and that of their students since the system was introduced in 1927 :

Year	Institutes	Students	Graduates
1933	42	1,039	618
1932	44	1,122	656
1931	44	1,232	856
1930	45	1,299	873
1929	45	1,280	977

Training of High-grade Professors No particular schools are instituted for the training of high-grade teachers. Scholarships, however, are given to students of the post-graduate courses of higher normal schools for training such professors. Further, persons of adequate career and experience are sent to foreign countries for a further prosecution of studies, their expenses being met by the Government. The following are figures concerning such persons at the end of March, each year :

Year	Students abroad	Year	Students abroad
1933	184	1930	361
1932	191	1929	428
1931	219	1928	437

As a further means of supplying higher grade professors, a professor's licence is granted to persons holding doctor's degrees and those who have graduated from universities and colleges. In 1932-1933 the number of persons who received Higher School Professor's licences was 1,012, of which 7 were women.

Training of Special School Teachers and Nurses of Kindergartens Teachers for the blind and the deaf and dumb are trained in the training courses in the Tokyo School for the Blind and the Tokyo School for the Deaf and Dumb. The nurses of kindergartens are trained in the training courses provided in women's normal schools, special courses in the higher normal schools for women and in the special institutions for the purpose established by private bodies. In 1932-1933 the number of kindergarten nurses' certificates without examination was 943.

Teacher's Certificate Given by Examination Persons who have similar scholastic attainments with the graduates of the schools mentioned above, may ask for an examination to get a teacher's licence. They have to undergo a strict examination by the special examination committees of the Educational Department. The number of persons who passed the examinations during 1932-1933 was 5,288. These may be classified as follows :

Teachers of	Applicants	Passed examination
Elementary School and Kindergarten	35,881	4,585
Normal School, Middle School and Girls' School	7,328	574
Higher department of Higher School	125	13
Business School	894	116
Total	44,228	5,288

Digitized by Google

Physical Education and School Hygiene

With a view to promoting the rational development of the young and to encourage and further the spread of gymnastics, games and athletic sports, both eastern and western, there was established in 1924 a national Institute for Research in Physical Training, where research work is now in active progress.

For school hygiene, special attention is paid to buildings and equipments, and efforts are being made to improve and strengthen the physical constitution of pupils and students by employing school physicians, dentists and nurses, by taking measures for the prevention of infectious diseases in schools, by making plans for open-air schools, vacation colonies, school feeding, school clinics and the like.

For the administrative organs responsible for the work referred to, Hokkaido and prefectures have school hygienic experts and directors of physical training, while the Department of Education has the Section of Physical Training, Supervisors of School Hygiene and the Institute for Research in Physical Training. In addition, there are provided in the Educational Department a School Hygiene Investigation Committee and a Physical Training Investigation Council, which investigate and make researches in important questions submitted to them by the Minister of Education.

Social Education

For the diffusion and development of social education there has been created a Bureau of Social Education in the Department of Education, and a certain number of supervisors of social education are appointed in the Department, and directors of the same in the local governments.

Adult Education For the benefit of those adults who have had little or no chance to receive regular education, the Department has requested some of the schools under its direct control or under that of the local governments to start a series of lectures. Most of the adults who are gathered to these lectures are labourers or farmers, and fuller reference to this is made in the chapter on labour.

Libraries The spread of libraries in Japan has been rather slow because of many reasons, but the place of the library in social education has been understood more and more clearly with the advancement of national and international life in recent years. The Government, therefore, established a national library at Ueno, Tokyo, and at the same time has given encouragement to local public bodies for establishing their own libraries by granting subsidies to them. It also tries to help them by holding short period courses for training capable librarians. The results of these efforts have been a notable progress in libraries, as may be observed in the following table:

Year	Public Libraries	Books (Unit, 1,000)	Readers	Daily average of readers of a library
1933	4,686	10,563	24,766	20
1932	4,609	10,138	24,980	21
1931	4,609	9,636	23,355	19
1930	4,553	9,276	22,835	19
1929	4,490	8,592	22,847	20

Digitized by Google

In November, 1931, the Tokyo Science Museum was established by the Government. It is located in Ueno Park, Tokyo and exhibits 1,579 technical and machine models and 100,858 specimens of natural science. In 1932-1933 224,854 people visited it in 356 days.

Cultural Work In order to promote the national spirit, as well as to effect the betterment of manners and mode of living, the Department of Education has taken up the task of furthering cultural work by giving encouragement to the activities of bodies and individual persons connected generally with national education and social enlightenment. Special efforts are being made to attain the object in view by establishing institutions and organs of various kinds, thus forming a cultural network throughout the country.

Young Men's Training Institutes A young men's training institute is designed to give mental and physical culture to young men with a view to maintaining and improving national standards. These institutions which are found all over Japan, side by side with the business continuation schools, are now reaping a good result. The following are the figures for such institutes and their pupils in the years 1929-1933.

Year	Training Institutes	Students
1933	15,546	835,723
1932	15,550	796,132
1931	15,617	794,171
1930	15,687	806,454
1929	15,766	843,702

Young Men's and Young Women's Associations With the object of giving mental and moral culture to those young men and women who are no longer cared for in the schools, the organization of young men's and young women's associations has been encouraged so that there is at present hardly any city, town, or village where they are not established. These associations work, on the whole, according to the principle of self-government, quite different from the foregoing Training Institutes, and along the lines which they choose in view of the circumstances peculiar to themselves.

The following table shows the number of young men's and young women's associations and that of their members in the years 1929-1933 :

Year	Y.M.A.	Members	Y.W.A.	Members
1933	15,300	2,497,166	13,378	1,522,041
1932	15,365	2,518,173	13,394	1,534,125
1931	15,202	2,495,708	13,225	1,567,123
1930	15,144	2,553,192	13,322	1,550,460
1929	15,295	2,534,326	13,043	1,514,459

Boy Scouts and Girl Guides The boy scout movement, which is also an important item in the social education of the young, has made much progress since the organization of the Japan Federation of Boy Scouts in 1922. The President of the Federation was the late Count Shimpei Goto, and its head office was located in the Department of Education building. The boy scouts which are affiliated with the Federation are scattered all over the Empire except 4 prefectures in Japan proper and the South Sea Mandated Islands. In 1925, the Marine Branch was established and it owns a training-ship.

The number of boy scout organizations and that of the members were approximately 1,100 and 90,000 respectively in March, 1935. The Federation is led by Count Yoshinori Futara at present.

The girl guide movement was first introduced into Japan in 1920. The earliest organizations appeared in Tokyo and Morioka, and the movement gradually spread over dif-

Digitized by Google

ferent parts of the country, although it has not yet achieved such progress as the boy scout movement, having only 27 guides with about 300 girls in 1931.

Educational Expenditure

Education in Japan, as previously mentioned, is principally controlled by the State, though it is partly delegated to local public bodies and partly carried on by private individuals or organizations by permission of the Government, and the expenditure incurred is met from these three different financial sources.

Part of the educational expenses of local public bodies, however, is met by the State Treasury in order that the teachers may be sufficiently paid and the burdens on the ratepayers may not be too heavy. Formerly the sum of ¥10,000,000 was yearly defrayed for this purpose, but it has been recently increased to ¥85,000,000 or more, and destitute municipalities receive special consideration in the apportionment of the grant.

Local governments are required to pay additional salaries at certain rates for long service to the teachers of schools for which they are directly responsible. To meet part of these expenditures, the Government allocates a sum of money fixed annually in the National Budget and divides it among Hokkaido and the prefectures in proportion to the number of teachers. In cases where a city, town or a village undertakes to pay for residences of elementary school teachers, the higher local body is required to share part of the expense.

No investigation having been made, by any authoritative body, as to the amount of private money spent on education, the figures given in the following tables refer only to the amounts expended by the Government and local public bodies. In recent years educational undertakings have been greatly extended and the treatment of teachers considerably improved in accordance with the post-war programme of the country, and this has caused the educational expenditures to swell in a remarkable degree. The following table shows the total governmental and public educational expenditures during the years 1929-1933 :

Year	State Treasury	Prefectures	Cities	Towns and Villages	School Associations	Total
1933	¥148,083,243	97,885,783	87,580,024	199,345,796	89,838	532,984,684
1932	137,239,255	106,856,178	77,676,969	197,723,655	87,829	519,583,886
1931	143,320,002	111,298,987	81,642,411	213,334,298	71,733	549,667,431[1]
1930	144,373,338	114,502,616	96,687,293	235,899,221	79,182	591,542,150
1929	134,902,101	113,295,483	101,832,676	256,132,052	61,740	606,224,052

1 Note: The figures refer to the settled accounts of the fiscal years. For instance, the year 1931 means the fiscal year April, 1930—March, 1931.

The above table does not include the amounts expended on local educational administration.

In order to show the total expenditures, both governmental and local, the year 1932-1933 is taken and full details of the items of expenditures are shown :

GOVERNMENTAL EDUCATIONAL EXPENDITURE

1932—1933

Administration	¥2,750,269
Elementary and Secondary education	90,664,294
Business education	601,980
Social education	2,135,113
Blind, Deaf and Dumb education	159,614
Universities and libraries	31,705,808
Miscellaneous	20,066,165
Total	148,083,243

Deaf and Dumb Schools	143,470	82,932	—	—	226,402
Miscellaneous Schools	57,767	283,240	57,792	—	398,799
Young Men's Training Institutes	—	1,023,319	3,762,461	625	4,786,405
Kindergartens	—	931,554	462,487	—	1,394,041
Libraries	507,512	631,242	251,579	—	1,390,333
Miscellaneous	33,404,229	2,196,862	4,398,096	2,833	40,002,020
al	97,885,783	87,580,024	199,345,796	89,838	384,901,441

The total amount of educational expenditure in Japan proper borne by private bodies is estimated at ¥36,000,000 a year, as may be seen from the following table:

School	Year	Expenditure
Middle Schools	1931—1932	¥4,471,645
Girls' High Schools	,,	6,752,057
Miscellaneous Schools resembling Middle and Girls' High Schools	1932—1933	1,788,780 (estimate)
Girls' Domestic High Schools	1931—1932	306,429
Business Schools	,,	6,477,753
Higher Schools	1932—1933	408,800 (estimate)
Colleges	,,	6,646,900 (estimate)
Universities	,,	8,698,700 (estimate)
Total		35,901,014

Other Schools

There are schools in Japan proper which do not come under the control of the Educational Department, and they have been excluded from the foregoing sections. But to complete the chapter on education we cannot pass without some mention of them. Fuller explanations may also be found in other chapters.

Peers' Schools They belong to the Department of the Imperial Household, and the purpose of their establishment is the education of the nobility, but admission to them is by no means restricted to children of titled families. They are called the Gakushu-in and Joshi (woman) Gakushu-in. The former is for boys and is composed of three departments, namely, elementary,

Digitized by Google

middle school, and college. In Sept., 1933, it had 69 teachers and 917 pupils. The latter is composed of two departments, namely, high school and college. In Sept., 1933, it had 69 teachers and 735 pupils.

Two Special Schools The Department of Foreign Affairs has two schools; one is the To-a Dobun Shoin (Tung Wen College) in Shanghai and the other the Russo-Japanese Association School at Harbin.

The Jingu-kogakkan This was established by the Home Department and is a Shinto seminary.

The Fisheries Institute This is under the Department of Agriculture and Forestry.

In the Territories, schools are under the control of the Territorial Governments, as a matter of course, and full descriptions of them may be found in the chapters on Territories. However, a list of the various universities and colleges is here appended.

CHOSEN
- Keijo (Seoul) Imperial University
- Keijo Imperial University Preparatory School
- Keijo Law College
- Keijo Medical College
- Keijo Technical College
- Suigen Agricultural and Forestry College
- Keijo Commercial College
- Eight private colleges

TAIWAN
- Taihoku Imperial University
- Taihoku College
- Four other colleges

KWANTUNG
- Ryojun (Port Arthur) Technical University
- Preparatory College for the same
- Four private colleges

Foreign Teachers and Students

The number of teachers and professors from Western countries engaged by Japanese schools or sent by Christian denominations in foreign lands in recent years was on the increase, and the fact shows that Japan and the Japanese are still eager to learn from the West. It may be safely said that the relations between Japan and the Western nations are becoming more intimate with the advancement of Japanese civilization and the international spirit of the people at large. The number of foreign students is also on the increase, the majority being young men from China, but the Manchurian incident affected their number for the time being. The number of foreign teachers and students at the end of March, 1933, was as follows:

Schools	Teachers male	Teachers female	Total	Pupils & Students male	Pupils & Students female	Total
Elementary	—	4	4	143	83	226
Higher Normal	5	—	5	146	—	146
Woman's Higher Normal	—	1	1	—	29	29
Middle Schools	39	8	47	11	—	11
Girls' High Schools	2	53	55	—	2	2
Higher Schools	70	2	72	81	—	81
Universities	123	2	125	473	13	486
Colleges	130	66	196	186	44	230
Business Colleges	66	—	66	80	—	80
Business Schools	37	14	51	4	—	4
Miscellaneous	70	367	437	563	374	937
Total	542	517	1,059	1,687	545	2,232

The comparison for the five years, 1929-1933, is as follows:

Year	Teachers	Students
1933	1,059	2,232
1932	908	2,761
1931	940	4,983
1930	871	3,588
1929	902	3,252

CHAPTER XXIX

RELIGION

General Survey

From prehistoric ages Japan has had an indigenous cult which is now known as Shinto. Confucianism and Buddhism were introduced through Korea and China later, and Christianity more recently still. Islam, however, never gained a footing on her soil, though its literature has been introduced to some slight extent.

Shintoism has had nothing to do with the thought and life of the people, apart from its relations with the functions of the guardian deities of the nation and communities. It resembles the primitive Greek or Roman cults, but is much simpler and purer, both as regards the nature of its deities and the motives of its worshippers. It is now divided into two, namely, national Shintoism, which is represented by the shrines, and sectarian Shintoism, which developed towards the end of the Tokugawa Shogunate.

Confucianism is rather a code of moral precepts than a religion, except in that it teaches some vague ideas regarding a heavenly God. In the realm of moral culture it has exerted great influence on the minds of the Japanese people and on their principles of daily life; that influence being very noticeable in the Imperial Rescript on Education of the Emperor Meiji. Further mention of Confucianism will be omitted here because it has no meaning as a religious cult.

Buddhism has had still greater influence on all phases of Japanese life. Its fatalism has had a retarding effect on the material progress of the Japanese as with other Oriental nations, but has induced a habit of dauntless composure in their behaviour, and its broad philanthropy gave rise to a spirit of mutual help among the people, subduing egoism or individualism. Its philosophical literature fed the national thought, while its fine art has left many masterpieces enriching the cultural life of the Japanese. This cult is still the most powerful among religions in Japan.

Christianity has made valuable contributions toward the civilization of Japan with its world-wide nature and positive teachings on human life. The number of believers is comparatively small, but its influence on the people's thought and morals is said to be even greater than that of Buddhism. It has raised Japan's moral standards, waging war against licensed prostitution, the low position of women, drinking and smoking, and polygamy as practised in a certain section of society. It has still to amalgamate itself with the life of the people in order to exert great influence upon them, but its future is hopeful.

Shinto Shrines

Most Shinto shrines are supervised by the Shrine Bureau of the Home Department, which consists of one chief official and 64 minor officials. The budgets of the Bureau for the fiscal year 1934-35 and 1935-36 are as follows:

Running expenses	1934-35	1935-36
Isé Great Shrine	¥230,000	¥230,000
Other national shrines	750,000	750,000
Ceremonies and rituals	7,105	7,105
Soldiers' shrines	14,255	14,255
Total	1,001,360	1,001,360

Digitized by Google

Incidental expenses	1934-35	1935-36
Repairs	¥396,500	¥849,000
Education of priests	11,066	11,066
Investigation	26,575	20,066
Reconstruction	35,040	35,184
Total	469,181	915,316
Sum total	1,470,541	1,916,676

The increase of repairs in 1935-36 is for shrines damaged by the typhoon of September 21, 1934.

The Isé Great Shrine is the most honoured of all the shrines as the first national shrine. The Goddess enshrined in it is Amaterasu-O-mikami, which may be translated as Heaven-Shining-Great-God. According to the Japanese mythology, Amaterasu-Omikami sent down her grandson to the Nippon Islands to rule the people by the Kingly Way, giving him the Three Sacred Treasures, which have been handed down even to the present Emperor as the sacred symbols of the Imperial Throne (see Appendix, The Constitution of Japan; The Imperial Household Law Article X; and Chapter III). In the Great Shrine and appendant shrines more than 10 gods, who represent the Imperial ancestors or personify natural powers, are installed beside the principal Goddess.

The name of the shrine comes from its location in Isé province or more accurately on the Isuzu river, city of Ujiyamada, Miyé prefecture. The whole sacred area of the Great Shrine includes 13,135 acres.

About 87 priests are attending it under a chief priest. There are established a seminary for the education of priests, a police station, two museums, and a library in connection with the shrine.

The budget for the fiscal year 1932-1933 was ¥1,457,044, its fund amounting to ¥2,026,432.

According to the report of the Shrine Bureau, the Home Department, the number of other shrines in 1932 was as follows:

Governmental and national shrines (in the whole Empire)	200
Prefectural and village shrines (in Japan proper)	49,454
Private shrines (in Japan proper)	61,500
Soldiers' shrines (in Japan proper)	123

The number of private shrines in Japan proper has been steadily decreasing since 1889, lessening from 136,783 in that year to 61,500 in 1932. There were many too superstitious and barbarous ones among them and the decrease speaks of the healthy progress of the religious ideas of the people and the radical policy of the government.

The total area of the sacred campus of these shrines (not including soldiers' shrines) covered 76,948,646 tsubo, 65,721,332 of it being government property.

The settled accounts of the 200 governmental and national shrines in the fiscal year 1931-1932 were as follows:

Income (yen)	Disbursement	Balance
3,699,601	3,409,045	290,556

In the income, there is included the contributions of worshippers amounting to ¥2,068,265. There were 11 shrines at which the contributions amounted to over ¥50,000. The sum total of the different kinds of fund possessed by these shrines amounted to ¥11,777,045 in the same fiscal year.

The total number of priests in Japan proper at the end of the year 1932 was 15,375.

For the education of priests there are one seminary of college grade at Isé as mentioned above, a department in Kokugakuin (Japanese literature) College of junior college grade, a middle school grade seminary affixed to the one at Isé, and 26 smaller places for giving a course of study, the total number of students being not more than 2,100.

Digitized by Google

It may be said, therefore, that the education of Shinto priests is much lower than that of Buddhist priests or Christian pastors.

Sectarian Shintoism

Shinto Sect This sect is called by the general name given to the national cult when by this name the various Shinto branches were known. The principal ideas of the sect are to develop the Great Way of the Gods, and to propagate the national cult indigenous to the people of this country. Its believers and devotees consider it their most important duty to cultivate reverence for the gods, cherish the spirit of patriotism, elucidate Heavenly Reason and Humanity, pay homage to the Emperor, and observe all the Imperial ordinances.

Kurozumi Sect This was founded by Munetada Kurozumi (1780-1850), who was born at a small village of Okayama prefecture. His main idea was to inhale, while contemplating the Goddess Amaterasu-Omikami, the energy of the sun, and thereby to fill up the heart with satisfaction and complaisance. He teaches to avoid the following seven evils, which are against the will of the gods: (1) to be faithless to the country of the gods in which one was born; (2) to get angry and to worry over things; (3) to be arrogant and spiteful; (4) to entertain evil desires from seeing others do evil; (5) to neglect one's household affairs while in good health; (6) not to have sincerity even when one is entering upon the path of sincerity; and (7) not to accept things gratefully for which one ought to be grateful every day.

Shinto-Shusei Sect Kunimitsu Nitta (1829-1902), who was born in the province of Awa, was the founder of this sect. According to its tenets, the great source of the Way issues from the three gods: Amenominakanushi-no-kami, Takamimusubi-no-kami, and Kamimusubi-no-kami. All human beings get their spirits originally from these gods, and our spirits, which are essentially as pure and as good even as the gods themselves, must be lovingly cherished and preserved. In order to do this, a doctrine is needed, which will keep our spirits under discipline, that is, well in order and in perfection.

Taisha Sect This was revived through the efforts of Sompuku Sengé (1845-1918), and teaches to revere and observe the divine will of the God Okuninushi, whose ideas of administration and spirituality constitute the Great Way of the Gods. When this is elucidated and the heavenly nature of the people is preserved, one's duty to the state is fulfilled, and all will be good, law-abiding citizens.

Fuso Sect The founder was Takekuni Fujiwara (1541-1646), and the one who furthered it was Han Shishino. Its chief doctrine is to worship the spiritual virtues of the three gods. Amenominakanushi-no-kami, Takamimusubi-no-kami, and Kamimusubi-no-kami.

Taisei Sect This was founded by Shosai Hirayama (1815-'90). The principal point of his teaching is to enhance the Great Way of the Gods. Its tenets are: (1) to worship the heavenly gods and the earthly gods and pay homage to the Imperial Sanctuary as well as to the august spirits of the successive Emperors; (2) to revere the divine ordinances infinite as heaven and earth, to extend the national principle of this country; (3) to illustrate in practice the moral codes ordered by heaven; (4) to discipline oneself in morality and truth, to fix the basis of faith wherein one gains peace

Digitized by Google

of mind; (5) to abide in the One Truth which unifies the two realms of the Manifested and the Hidden, to get enlightenment on the true meaning of life and death; (6) to undertake scientific investigations and encourage various enterprises; and (7) as regards the divine rites and ceremonial affairs, to follow the traditional standards which have been bequeathed by the successive courts.

Jikko Sect This sect, founded by Hanamori Shibata (1809-'90), makes it its principal teaching to promulgate the Great Way of the Gods, which is to be put into practice in our everyday life. We read in its tenets: (1) to enhance the Great Way of the Gods; (2) to study the ceremonial codes of this Divine Land; and (3) to spread the doctrine original to this country.

Shinshu Sect The founder of this sect was Masamochi Yoshimura (1839-1916) of Mimasaka province. He teaches to worship the heavenly gods and the earthly gods, to practise the divine rites according to the ceremonial codes of the successive courts as well as according to the formulas bequeathed by the family of Onakatomi, and to enhance the Great Way of the Gods.

Ontaké Sect Its teachings chiefly consist in following the Perfect Way of the Gods, enhancing the great principles of reverence to the gods, honour to the Emperor, and patriotism, and engaging in mission work in accordance with the laws of the state. The chief gods to whom worship is offered are Kunitokodachi-no-mikoto, Onamuchi-no-mikoto, and Sukunahikona-no-mikoto, who are called the Great Gods of Ontaké. Their spirits are believed to have been incorporated in Mount Ontaké, which means literally the "honourable mountain," on which the gods taught mankind the arts of medicine and magic. The origin of the sect is considered to lie in this legend.

Misogi Sect The Misogi Sect, or the Sect of Water Purification, was founded by Masakané Inouyé (1790-1849) of Isé province. This sect is an extension of the Shinto doctrine which teaches purification and keeping evils away. These two practices are divine deeds which originated with the Gods Izanagi and Susano-o-no-mikoto.

Shinri Sect The Shinri Sect, or the Sect of the Reasons of the Gods, was founded by Tsunehiko Sano (1834-1906). In his exposition of the ancestral doctrine, he urges us to honour the spirits of all the heavenly gods and the natural reason inherent in all things, and thereby to find the way to faith.

Konko Sect The founder of this sect was a farmer called Bunjiro Kawaté (1814-1883) who became, while alive, Daijin Konko, or the Great God of Golden Lustre by the divine order of the heavenly god he believed in. His main teachings are to pay homage to the God Konjin of north-east, to elucidate the great principles of heaven and earth, to cherish patriotism, and to propagate the idea of oneness of this and the other world, and faith in the reason of life and death.

Tenri Sect This sect, which means the Sect of Heavenly Reasons, was founded by a woman called Miki Nakayama (1798-1887) of Yamato province. She teaches that the gods must be reverenced, patriotism encouraged, Heavenly Reason and Humanity elucidated, the Emperor honoured, and the Imperial ordinances obeyed. It lays great emphasis on practical discipline, and tells us that eight forms of dust must be swept away, which are: (1) grudging; (2) desires; (3) impure attachment; (4)

Digitized by Google

hatred; (5) enmity; (6) anger; (7) covetousness; and (8) arrogance.

Oomoto Sect Oomoto-kyo was founded by a woman, Nao Deguchi, in 1892. She was born in 1836 in a little town of Fukuchi-yama, Kyoto prefecture. It is said that this woman was often possessed by God since 1892, and her principles and teachings were left in "O-Fudésaki" or sacred creeds written by her own Japanese pen in the dark through a revelation in trance, and were further expounded by Onisaburo Deguchi, whom the believers call "Master." The word "Oomoto" means the "great basis" or "foundation" of the universe. Its four mottoes are: (1) purification of mind and body, (2) unity of social classes, (3) optimism, trusting in God's plan, and (4) progress or improvement of the world. The gist of its teaching is as follows: Complete harmony among men must be the condition for attaining peace and happiness. The bringing about of world union will have to be done by spiritual means and not by political or military methods. Therefore all earnest believers in Christ, Buddha and God the Father should gather together under the holy banner of Peace. It is moreover God's will that his children should unite in one and the same worship. God is the spirit present in everything in the universe and men are the administrators of the world. One of the essentials for attaining a Heavenly Kingdom on earth consists in unselfish toil for the evolution and progress of society. Master Onisaburo Deguchi proposes to realize a new world organization believing in the God, the Heavenly Truth, the Common Way of heavens and earth, and through other diverse means.

This sect is not yet recognized by the Government as a legitimate one, having only a short history of 40 years, and it is hard to get an accurate number of believers. But it has increased to a considerable number especially after its union with some mystic sects in Manchoukuo and China a few years ago, and there are believers among the peoples not only in the Orient, but also in many of European and American countries. According to the report of the head temple which is now located at Kameoka near Ayabé mentioned above, there are 20 large temples, 17 smaller temples, and 1,700 branch offices, with 6,200 preachers altogether. The number of followers of this sect is roughly estimated at 3,000,000.

Buddhism

It was in the thirteenth year of the Emperor Kimmei (552 A.D.) that Buddhism, first founded in India, came over to Japan after passing through China and Korea. The devotion of Prince Shotoku at the time gave a great impetus to its propagation throughout the country. Six schools of Buddhism, that is, Sanron, Hosso, Jojitsu, Kusha, Ritsu, and Kegon were introduced one after another. In the reign of the Emperor Kwammu (782-805 A.D.), Tendai and Shingon flourished. New schools such as Jodo, Zen, Shin, Nichiren and others then gradually developed. Through these long periods of its history, Buddhism further differentiated itself, owing to differences in the exposition of the doctrines and in the methods of propagation, into many sub-sects. Eleven of the principal sects still in existence are Hosso, Kegon, Ritsu, Tendai, Shingon, Yuzunembutsu, Jodo, Shin, Ji, Zen, and Nichiren; and these eleven are sub-divided into fifty-eight branches. Principal teachings of the eleven Buddhist sects follow:

Digitized by Google

Hosso Sect This sect was introduced into Japan by Dosho (628-700), a Buddhist priest who went to China in 653 and studied the teachings of this sect under Hsuan-tsang. The main teachings of Hosso are that all sentient beings find Salvation in accordance with the difference in character and endowments, of which five yanas are to be distinguished, that the doctrinal system of this sect and its scriptural texts are in full correspondence with the truth, that as all things are merely manifestations of pure consciousness, there are no real ego-souls and no real objects, and that the great fruit of Bodhi and Nirvana is attainable in and through the reality of the Middle Path which is neither existent nor non-existent.

Kegon Sect Roben (688-776) of Todaiji Temple, Nara, the first propagator of this sect in Japan, learned its doctrines from the Chinese Buddhist priest Dokei who visited Japan during the Tempyo era (729-749). The teachings of this sect are based upon the Kegon Sutra, which says that the ultimate reason of Suchness is absolute and infinite; the Ultimate and the Manifested are mutually related and intimately intertwined; each Manifestation too is so thoroughly and interminglingly related to another Manifestation that between the two there is no wall of individual separation. The teachings of the sect are, therefore, called the Perfect Doctrine. Those who, in accordance with the doctrine, understand the mystery of the mute evolution of the spiritual cosmos, and who practise goodness and are guarded in their conduct, are sure to attain Buddhahood and to realize the Ultimate Reason. The head-temple of this Sect is Todaiji in the city of Nara.

The term "Shinnyo", or tathatva, which we have translated "Suchness" in the foregoing, is a very comprehensive word, signifying "truth", "reality", or "the first principle of emptiness". The first character, "Shin", means "that which is true without any admixture of error". The second "Nyo", is the same as is usually translated "like". The two taken together have come to mean "the Absolute Itself". There are three main interpretations of it. The Kegon Sect, as one of these interpretations, identifies the absolute and the relative, the noumenal and the phenomenal, asserting that each separate phenomenon, being endowed with the qualities of the Absolute, has unlimited power to produce other phenomena. The doctrine derived from the Kegon Sutra teaches that even a single particle of dust has the manifold, infinite and absolute virtues of all things in the universe, and that so, if a man observes a certain practice, he is at the same time doing all other religious practices.

Ritsu Sect The Ritsu or the Sect of Moral Discipline ("Vinaya" in Sanskrit) was first propagated in Japan by Ganjin (686-763), a Chinese Buddhist priest, who came to Japan during the Tempyo era (729-749). It obtains its name from the Vinaya-pitaka, according to which its followers strictly regulate their daily conduct. It teaches to observe, as ordered by Buddha, all the precepts ("sila" in Sanskrit) such as the Five Precepts, the Eight Precepts, the Six Novitiate Precepts, the Ten Precepts, or the Two Hundred and Fifty Precepts. Toshodaiji in Nara prefecture is the head-temple of this Sect.

Tendai Sect The founder of this sect was Chisha Daishi (537-597) of the Sui Dynasty.

A Japanese priest Saicho (Denkyo Daishi, 766-822) went over to China

Digitized by Google

in the year 782 during the Yenryaku era, and studied the principles of Tendai there. On his return to Japan, he became the chief exponent of the sect in this country. The teachings of the Tendai Sect are comprised in two divisions, metaphysics and meditation. It critically systematized in its metaphysical part all the teachings of Sakyamuni, drawing a clear line between what is mere expedient and what really represents the spirit of the founder of Buddhism. As the result Tendai has come to consider Saddharma-pundarika Sutra (that is, The Lotus of Good Law) the doctrine of Sakyamuni, in which the reason of his appearance on earth is truthfully explained. The meditation part consists in applying our minds to all that is taught in the Sutra and realizing it in our daily practical life. Ten grades are distinguished in the practice of meditation, while its main object is to put a stop to disturbing thoughts and to get enlightened on the principles of the four classes of Buddhist doctrines. The ultimate end of all this is the realization of the mysteries of the Pundarika. When you perceive that the Hidden and the Manifest are of one and the same essence and realize that state of mind which is known to the Buddhas only and to nobody else, you have the central teaching of Tendai, that is you have attained the final enlightenment in which the spiritual and the material are thoroughly unified.

They have three sub-sects or branches in this sect, each of them having its own head-temple. They are: (1) the Tendai Branch, whose head-temple, Yenryakuji, is situated in Shiga prefecture; (2) the Jimon Branch, which has its head-temple in Onjoji of Shiga prefecture; and (3) the Shinsei Branch, the head-temple of which is Saikyoji of Shiga prefecture.

Shingon Sect The first exponent of this sect in Japan was Kukai (Kobo Daishi, 773-835), who went over to China soon after Saicho, the Japanese founder of Tendai. According to this sect, there are three fundamental conceptions, which are, Substance, Appearance, and Function. The Six Universals—earth, water, fire, air, the void, and consciousness —are Substances. The four systems of Mandala, that is, Great Mandala, Samaya Mandala, Dharma Mandala, and Karma Mandala, are Appearances. The three Secrets — body, words, and mind—are Functions. The Six Universals are the elemental substances of which all things are constituted. They take Appearances, which, though innumerable, can be classified under four headings. The first is the Great Mandala representing all living beings such as Buddhas, Bodhisattvas, Gods, evil spirits or human beings. The second is the Samaya Mandala which consists in Mudras and symbolic instruments of Buddhas, Bodhisattvas, devas, and spirits. The third is the Dharma Mandala containing all the names or titles of the Buddhas and other beings. The fourth and last one is the Karma Mandala in which are represented all the Functions as well as the outward bodily attitudes assumed by Buddhas and other beings. As the six Universals are infinite and mutually intermingle and are most intimately related, so the four Mandalas are also mutually related and intermingled. That is to say, the Buddhas' four Mandalas are also our own just as they are in the Buddhas, and conversely, our own Mandalas are those of the Buddhas. When the four Mandalas or Appearances are symbolized in our bodies and our fingers are "knotted" after the regular formulas, and the mouth recites

Digitized by Google

the various Mantram and Dharanis, and the mind contemplates the sameness of the mind, Buddha, and all sentient beings, then the Functions of the three Secrets are completed. Let this completion be attained, and we are Buddhas while we are in this material existence.

"Mandala" has a large number of different meanings. It is often applied to concrete objects such as an altar, a platform, a circular plate, a picture, and possibly an image; but it came to have the abstract meaning of "growth", "perfection", or "a complete collection of all virtues."

This sect is sub-divided into eight branches, which are: Koya, Omuro, Daikakuji, Daigo, Toji, Yamashina, Ono, and Senyuji.

Three hundred years after the death of Kukai, the Japanese founder of Shingon Sect, a priest called Kakuban known as Kokyo Daishi (1094-1143), established a new school of Shingon. Under this there are two branches now, one of which is Chizan and other Buzan. The head-temple of the former is Chishaku-in, Kyoto, while that of the latter is Chokokuji (Hasedera), in Nara prefecture.

Yuzu-nembutsu Sect This was founded in 1117 by Ryonin, known as Showo Daishi (1071-1132). Its principal teachings are that as all things are essentially of one nature and intimately related, the virtues of one person must be also those of all others, and conversely; that the merits of the Buddha's name invoked by all earnest hearts will mutually grow, establishing a spiritual communion with one another in a most thorough manner; that therefore the invoking of the Buddha's name and contemplating him, even during this short period of one's earthly life, must bear the great fruit, if it is most sincerely done, of making us all attain to Buddhahood through the perfection of infinite merits.

The head-temple of this sect is Dainembutsuji of Osaka prefecture.

Jodo Sect The founder of this sect was Genku, known as Yenko Daishi or Honen, (1133-1212), and it was established in 1174. The basis of the doctrines of the Jodo Sect is laid upon the original prayers of Amitabha Buddha. Being convinced of the general sinfulness of human nature, which makes us incapable of enduring all the painful process of self-discipline and self-perfection, Jodo teaches us to throw all our reliance upon the strength of the original prayers of Amitabha Buddha. When we thus, absolutely believing in him, invoke his name with all the sincerity of the heart, we shall be born in future in his Pure Land. The head-temple, Chion-in, is in Kyoto.

One of Genku's disciples, called Shoku (1176-1247), established a new separate school at Nishiyama, which is known as the Seizan Branch of Jodo. This branch is again subdivided into three: (1) Zenrinji, its head-temple bearing the same title, is in Kyoto prefecture; (2) Komyoji; and (3) Fukakusa, Seigwanji, Kyoto, is its head-temple.

Shin Sect Shinran (1173-1262), who is known as Kenshin Daishi, founded the Shin Sect. He was a disciple of Genku, and the main doctrines do not vary so very much from those of his master except in this: that we, the ignorant, have no real existence, and however strenuously we may exert ourselves, we have no "causal germ" in us which will develop into Buddhahood. The priests of the sect can marry and eat flesh. The original prayers of Amitabha in which the invocation of the Buddha's name is highly recommended, testify that the causal germ

Digitized by Google

of Buddhahood, by virtue of the efficiency of the prayers, will be planted in us, which means that all that is necessary for us to be reborn in the Pure Land of Amitabha is now sufficient and fulfiled.

There are at present ten branches of the Shin Sect: Hongwanji, Otani, Bukkoji, Takata, Kibé, Kosho, Idzumoji, Yamamoto, Seishoji, and Sammonto.

Ji Sect This was first promulgated by Ippen (1239-1289). The principal ideas of the sect are: Life is a frail and impermanent thing, and as every moment of it flits away, every act of ours must be regarded as the last one on earth. When, perceiving the truth of this fact, we do not neglect in every thought of ours to invoke the name of the Amitabha Buddha, we shall surely reach the final blissful state of Buddhahood.

The head-temple, Shojókoji, is in Kanagawa prefecture.

Zen Sect Under this name three Sects are comprised: Rinzai, Soto, and Obaku.

The Rinzai Sect of Zen was first taught by Yeisai (1140-1215) who came back from China in 1192. Soto finds its first Japanese exponent in Dogen (known as Joyo Daishi, 1199-1253) who studied zen in China during the Sung dynasty and returned to Japan in 1234. Obaku was introduced to Japan by a naturalized Chinese priest Yin-gen (1592-1673) in 1653.

The Zen Sect teaches the doctrine which is known only to the Buddhas and the transmission of which takes place only from one mind to another. It transcends logic and objective understanding. We do not have to purify ourselves from sins, nor is it necessary to seek after supreme knowledge. The ultimate truth is not in mere learning, thinking, or in discipline. It is above doctrines, meritorious deeds, and also above any special attainment. Zen teaches us to abide right in the truth and reality of life, every act of which will then reveal thousands of Samadhis. Whether lying or sleeping, whether drawing water or hewing wood, every movement grows full of significance. That is why Zen sums up its teachings in the following four phrases: "No reliance on word or letter; a special transmission outside of the scriptural doctrines; a direct pointing at the soul of man; and attainment to Buddhahood by seeing into one's own mind."

There are fourteen branches in the Rinzai Sect: Kenninji, Kenchoji, Tofukuji, Engakuji, Nanzenji, Daitokuji, Myoshinji, Tenryuji, Yeigenji, Shokokuji, Hokoji, Buttsuji, Kokutaiji, and Kogakuji. The Soto Sect has two head-temples, Yeiheiji, and Sojiji. Obaku is undivided, and its head-temple is Mampukuji, Uji.

Nichiren Sect This was founded by Nichiren (1222-1281) on the merits of the Saddharma-pundarika Sutra. The life of the Sect is in the seven syllables of "Na-mu-myo-ho-ren-gékyo," which is called "Daimoku," or a kind of theme. As this is the title of the Sutra revealing the absolute oneness of all opposites, even evil-hearted ones will attain to Buddhahood if they recite it in sincerity, and along with it all the ten universes will be equally benefited.

This sect is sub-divided into nine branches: (1) Nichiren-shu (the head-temple, Kuonji, is in Yamanashi prefecture); (2) Hommon-shu, (Hommonji at Ikegami and six other temples in Shizuoka prefecture are its head-temples); (3) Hokké-shu, (its head-temple, Honjoji, is in Niigata prefecture); (4) Kempon-hokké-shu, (Kochoji and other four temples in Shizuoka prefecture

Digitized by Google

are its head-temples); (6) Hommyo-hokké-shu, (its head-temple is Honryuji, Kyoto); (7) Nichiren-seishu, (its head-temple is Daisekiji in Shizuoka prefecture); (8) Nichiren-shu-fujufusé-ha, (its head-temple is Myokakuji in Okayama prefecture); and (9) Nichiren-shu-fujufusé-komon-ha, (the head-temple, Honkakuji, is also in Okayama prefecture).

Christianity

Before the Restoration Christianity was first introduced into Japan by Francis Xavier, a Jesuit Father, who came to Kagoshima in 1549. This was the time when Nobunaga Oda was at the height of his power, and he gave great encouragement to the spread of the Christian religion. Hideyoshi Toyotomi, his successor, too, was kindly disposed towards it. Combined with the devout and untiring work of the missionaries, this attitude on the part of the authorities made it possible for Christianity to gain followers with wonderful rapidity. Their number is reported to have run into hundreds of thousands.

Hideyoshi, however, changed his policy later on. Christianity was interdicted, its followers were persecuted, and the missionaries had to leave the country. When the Tokugawa Shogunate was established, still stricter measures were adopted, especially after the Shimabara Rebellion in 1637. Christianity had now no hope of being revived under the rigorous government policy of exclusion. The only port open to foreigners was Deshima, Nagasaki, where the Dutch tradesmen were allowed to carry on their business.

The American envoy, Commodore Perry, came to Uraga in 1853, demanding a friendly commercial treaty with his country. The Shogunate government granted this request in 1854 not only to America, but to Russia, England, France and Holland, and in the year following the three ports of Kanagawa, Nagasaki, and Hakodaté were opened to foreign trade. A party of American missionaries were the first to avail themselves of the opportunity thus offered to them. Among them were the Rev. J. Liggins, of the Protestant Episcopal Church of the United States of America, and the Rev. M. C. Williams, who came to Nagasaki in 1859. These were soon followed by Dr. G. F. Verbeck, of the Presbyterian Church (1859), and J. Goble, of the American Baptist Missionary Society (1860), and others. In 1864, the Rev. J. H. Ballagh, of the Dutch Reformed Church, came from America, and in the following year Dr. Thompson, of the American Presbyterian Church, reached here as a missionary.

In 1869, the Rev. D. C. Greene made Kobé the basis of his mission work representing the American Board of Commissioners for Foreign Missions. The first woman missionary, Miss Kidder, of the Dutch Reformed Church, arrived here in the same year. In 1873, the American Methodist Episcopal Church and the Canadian Methodist Church sent their missionaries, and in 1876 the Evangelical Association of North America started its propaganda work.

The Restoration When the feudal system of Tokugawa collapsed and the Imperial House was restored to power, the edicts prohibiting "Kirishitan" were withdrawn in the sixth year of Meiji (1873), and the missionaries were officially permitted to establish schools, to publish religious tracts, and to preach their doctrines in all the sea-ports open for foreign trade. In 1872, the Rev. Brown and Rev. Ballagh of Yokohama established, aided by their young fol-

Digitized by Google

lowers, a Christian church to be known as the Yokohama Yaso Kyokai, which was the beginning of the Union Church. In the following year a sister church was organized at Tsukiji, Tokyo. This was the first Christian church in the metropolis. In 1876 Nagasaki saw another church established. Later all these churches were federated in the name of the United Church of Christ in Japan. This was the origin of the Nihon Kirisuto Kyokai. The Rev. D. C. Greene who started his mission work in Kobé established a church known as the Settsu First Christian Church. This was the first Congregational Church ever organized in Japan, and developed into the present Kobé Kumiai Kirisuto Kyokai. In the same year the Umemoto-Cho Church came into existence in Osaka, which later came to be called the Osaka Kumiai Kirisuto Kyokai. Some time before this, thirty-five students of the Kumamoto Foreign School, who were converted to Christianity under the influence of their American teacher, Captain Janes, came up to Kyoto, and entered the Doshisha College just established by Jo Neeshima, who had lately returned from America. After their graduation from the college they grew active as propagators of Christianity, and built up the foundations of the Nihon Kumiai Kirisuto Kyokai. In 1872, the Rev. Loomis and Rev. Ballagh opened a Bible class for young men in the above-mentioned Church at Yokohama every Sunday afternoon. In 1873, a Congregational Missionary, Dr. Berry, set up in Kobé a Sunday-school, probably the first one conducted in the Japanese language. As to the vernacular translation of the Bible, in which Dr. Brown had been engaged for some time, the work progressed rapidly early in the Meiji era, and the New Testament was completed in December, 1879, and the Old Testament in 1886. The chief translators were Brown, Verbeck, Greene, and Maclay, while among the native assistants were Takakichi Matsuyama, Masatsuna Okuno, Masahisa Uyemura, Kajinosuké Ibuka, Goro Takahashi, and others.

Y. M. C. A. In 1880, the Young Men's Christian Association was first organized in Tokyo, and among the leaders must be mentioned Hiromichi Kozaki, Kajinosuké Ibuka, Masahisa Uyemura, and Yoshiyasu Hiraiwa.

In 1870, Miss Kidder opened a school for girls in Yokohama. This was the first institution of the kind in Japan, and from it developed the present Ferris School for Girls. Four years later another girls' school, Kobé Jo Gakuin, was erected in Kobé by the Congregationalists.

According to the statistics of 1882, there were in that year 145 foreign missionaries, 93 organized churches, 13 of which were self-supporting, 4,367 adult members, 39 mixed schools, 15 girls' schools, 9 middle schools, 7 theological colleges, 109 sunday schools, 49 ordained preachers, 100 assistant preachers, 37 Bible women, and 5 hospitals.

In 1883, the Church of Christ sent missionaries to Japan, and in 1885 the Presbyterian Church of the United States of America did the same. The American Society of Friends, and the Evangelical Protestant Missionary Society of Germany and Switzerland also dispatched their agents. In 1886, missionaries came from the Methodist Episcopal Church, South, and in Osaka a hall was set up for the Young Men's Christian Association. In 1887 the missionaries and representatives of the Episcopal Church of England and America had a conference, the result of which was the

Digitized by Google

organization of the Holy Catholic Church of Japan. In the same year, the American Unitarian Association sent its representative, the Rev. A. M. Knapp, and following him came the Rev. Clay McCauley.

Freedom of Faith On February 11, 1889, the Constitution was promulgated, and freedom of faith was definitely guaranteed by Article XXVIII. This year, L. D. Wishard, International College Secretary of the Young Men's Christian Association, came, and planned out a summer school for Bible study for the first time in this country. Since then every summer sees its work carried on. The United Church of Christ in Japan changed its name into the Church of Christ in Japan, compiled a fundamental law, settled on its creeds, and at last became an independent organization. Soon after, they put up a Board of Missions and made progress towards financial independence.

In 1890, the Universalist General Convention of America sent its missionaries. In 1895 officers of the Salvation Army came, and Gumpei Yamamuro joined it, and they at once started on their propaganda work. In the same year, the United Brethren in Christ started a mission.

While the foreign missionaries, up to 1901, had not been allowed to hold land in Japan, which greatly inconvenienced their activities, the Home Minister this year gave permission to the Baptist Missionary Society in Japan to organize a corporation which could hold and manage lands and buildings for missionary purposes.

In 1905 the Japanese Congregationalists planned to be financially independent of the foreign mission at the end of this year, in which they later succeeded.

In 1907 representatives of the Methodist Church of Canada, the Methodist Episcopal Church, South, and the Methodist Episcopal Church convened in Tokyo with a view to effect a confederation of the three denominations in Japan. The First General Conference of the Methodist Church of Japan thus took place, and Yoichi Honda was chosen to be its first Bishop and was duly consecrated. In the same year F. L. Brown, of the International Sunday School Association, arrived and the outcome of this visit was the organization of the Sunday School Association of Japan, marking an epoch in the history of the Sunday School of the Christian Church. The conference of the World's Student Christian Federation was also held this year in Tokyo, in which 160 foreign visitors took part representing twenty-five nations. This was the first world's convention of any kind in Japan.

Roman and Greek Churches The Catholic Church has been active ever since the opening of the seaports for foreign trade. The missionaries from the Societé des Missions Etrangères in Paris are working all over the country, which is now divided by them into seven districts: Tokyo, Osaka, Hakodaté, Nagasaki, Shikoku, Niigata, and Sapporo. At present a Bishop resides in Tokyo, and in Shikoku the Dominicans from Spain are active, while in Hokkaido the Franciscans have found their principal fields of activity, where there are two Trappist monasteries. The Jesuit missionaries reached here again in 1908, but instead of following up their predecessors' work, they have now a college established in Tokyo and concentrate their efforts on education. Besides the Jesuits, those that are chiefly engaged in educational work are Missionnaires de Marie, Société des Soeurs de Saint Paul, Société de Sacré Coeur and others.

Digitized by Google

In the prefecture of Nagasaki where the Catholics have been at work for the last three hundred years, though secretly, they are still in the ascendency.

The activities of the Greek Church centered in the person of the Russian priest Father Nicolai, who came to Japan first as priest attached to the Russian consulate in Hokkaido in 1859. He reached Japan after crossing Siberia, and while settling in Hakodaté, he baptized Takuma Sawabé and two other Japanese. In 1872 he came to Tokyo where he began missionary work. In 1884 he started to build a fine large church in Tokyo, which was completed in 1891. The church was regarded at that time as the greatest and finest building of this sort throughout Japan. The internal disturbances in Russia which followed the great world war made it very difficult to maintain this beautiful edifice, until in 1919 the followers succeeded in organizing an independent church known by the name of the "Orthodox Church of Christ in Japan."

State Regulation of Religions

Supervising Office A wholesale change of the governmental system took place at the time of the Restoration, and in the third year of Meiji (1870) the Mimbusho was established to take care of various affairs of the state, such as general home affairs, communications, etc. In the fourth year, this office was abolished, and the office of religious affairs was transferred to the Finance Department. With the establishment of the Kyobusho, or Department of Religions, in 1872, the shrines and temples were placed under the care of the new office. Then the Government appointed Shinto and Buddhist priests as official religious instructors who were to preach and educate the people according to the moral principles as follows: (1) to cherish reverence for the gods and the spirit of patriotism; (2) to elucidate Heavenly Reason and the principle of humanity; and (3) to honour and pay homage to the Emperor and to observe the Imperial ordinances. Afterwards the Kyobusho was abolished too, and all the business conducted by this office up to that time was transferred to the Department of Home Affairs which was established in 1873. The official appointment of religious instructors (Kyodo-shoku) was discontinued in 1884, and the business of appointing preachers was entrusted to the head-priests (Kwancho) of the various religious sects, together with the right of selecting the resident priest (Jushoku) for the temples under their jurisdiction. Each sect was, moreover, given the power of managing its own affairs under the supervision of the Government. Religion was thus separated from politics. With the promulgation of the Constitution on the 11th of February in the 22nd year of Meiji (1889), the principle of religious freedom was firmly established. In April, 1900, the former Bureau of Shrines and Temples was divided into two sections, i. e., the Bureau of Shinto Shrines and the other the Bureau of Religions. All administrative policy concerning the Shinto shrines is now in charge of the former and is entirely independent of the policy governing religions. The Bureau of Religions was transferred to the Education Department in 1913, and is under its jurisdiction at present.

Administration of Religions At present, there are three kinds of religions in Japan. These religions are dealt with by the Government each in a different way, because Japan is still without specific laws defining the political status of these

Digitized by Google

religions in connection with the State, though the principle of the administrative policy can recognize no such difference, as the Constitution guarantees freedom of faith. The Government, however, finds it natural not to mete out a uniform method of supervision over all these religions; for Buddhism, which has been in very close relation to the State and society for over one thousand years, and Shinto, which is the national cult of Japan, and Christianity, which was introduced to this country only half a century ago (putting aside the fact that it was once in this country a few centuries ago) can hardly be treated in a uniform method with satisfactory results.

From a practical point of view, the religious denominations which are officially recognized and come under the proper jurisdiction of the Bureau of Religions at present are Shinto and Buddhism. The denominations of Shinto are called "Kyoha" and those of Buddhism "Shuha." A religious order is a congregation of preachers and adherents following a definite system of creeds having temples or preaching halls from which their religious movements issue. Shinto and Buddhist Sects have not yet special regulations concerning cases of secession or incorporation, inasmuch as they are not allowed to make such regulations without the approval of the Education Minister. But affairs concerning the inner policy of the various sects are generally left to their own self-government, though the religious sects concerned are required by the State to compile fundamental rules defining their administrative policies approvable by the Education Minister.

Alteration of Rules The approval of the Education Minister is also required when they abolish or alter these rules. Each sect, Shinto or Buddhist, is required by the Government to select a head-priest, or Kwancho to govern and represent that sect. The appointment of a head-priest also requires the official approval. In the compilation of a constitution for each sect they have to define the following particulars: (1) the fundamental law, (2) the status of the preacher and his official title, and (3) the grades of preachers and their appointment and dismissal. These particulars are to be regulated by each Shinto head-priest. Meantime, each Buddhist head-priest is to regulate the following particulars: (1) the fundamental law, (2) rules concerning the management of temples, (3) the status of the priest and preacher and their official titles, (4) the appointment and dismissal of the resident priest, or Jushoku, of a temple, and grades of preachers, and their appointment and dismissal, and (5) the preservation of old historical documents, treasures, and properties belonging to the temples.

Besides thus defining the particulars as stated above, the constitution of each sect has to regulate, through practical necessity various affairs concerning its self-government. It must define, for instance, the functions and powers of the head-priest and the method of election; the organization and power of the council; functions of various officers; financial affairs; organization of a temple or a preaching hall; qualifications of a resident priest; affairs relating to the personnel, such as conferring honours or giving punishments; missionary work; education; and other functional activities. Needless to say, the head-priest governs his own sect according to the articles of this law. In short, the work of the Government in the matter of supervision over

Digitized by Google

the various sects of Shinto and Buddhism, is to indicate to them what is needed for that kind of work prior to the compilation of their fundamental laws, and to give its official approval when these laws are prepared, and then to see if all the provisions are carried out satisfactorily.

While all the Shinto and Buddhist sects are thus placed under the direct supervision of the Government as far as such fundamental affairs as are mentioned above are concerned, they are left to the care of the local governments concerning the practical functionings of their propaganda work. When the Shintoists or Buddhists want to build their temples or preaching halls, for instance, they must approach the local governments for permission. As Buddhist temples are, on account of their historical significance, regarded as legal persons, the use of the temple grounds, changes in their acreage, cutting down of the trees, and disposition of immovable property, temple treasures, historical documents, or fundamental funds, etc. all require the approval of the local governor concerned.

Special Treatment of Christianity The Government gives no official recognition as regards the Christian denominations, because they, as such, stand in no legal relationship to the Government. In the case of Christianity, therefore, the official supervision does not go further than looking after its missionary activities, selection of preachers, establishment of churches or preaching halls, etc. The Ordinance No. 41 of the Education Office issued in 1899 requires that those who wish to engage in missionary work notify the local governor of the name of their religion and methods of preaching with their personal history. When they want to build churches or other establishments for religious purposes, they have to approach the local authorities for permission, stating details of these establishments, methods of management and maintenance, qualifications of the preacher, and the process of selecting such preacher. In other words, the Government has special provisions for the Shinto and Buddhist denominations because of their peculiar historical status, while it is contented with being a mere overseer as regards Christianity. As far as their religious functions are concerned, however, the Government makes no distinction whatever between Shinto and Buddhism and Christianity. All religious sects are left to themselves unmolested as long as they do not disturb the peace of the country or practise immoralities in connection with the propagation of their doctrines and the carrying out of their respective religious rituals.

Educational Institutions There are a large number of educational institutions established by various religious sects for the purpose of bringing up properly qualified preachers. Like other professional or general educational establishments, these religious schools are under the supervision of the Education Minister. Meantime, charity works such as reformatories, dispensaries and other organizations financed by the religious bodies are placed under the jurisdiction of the Home Minister similarly with activities maintained by unreligious bodies in general.

Religious Statistics

The following are the statistics of preaching halls, preachers and adherents of various religious sects and denominations:

1934-35 Religious Activities The Broadcasting Corporation of Japan inserted religious lectures in the morning programme, which stimulated religious interest among the people. Buddhist monks and preachers drew adherents in great numbers, specially in Tokyo and Osaka. Christianity seems, on the contrary, to be on the standstill except Methodist Churches, largely due to the nationalistic trend of thought prevailing in Japan for recent several years. Dr. John R. Mott paid a visit to Japan in March, 1935, and held meetings and conferences but evidently with little results.

The second North Pacific Buddhist Young Men's Union Meeting was held four days beginning with July 18, 1934, in the new edifices of the Tokyo Temple of the Hompa Hongwanji. All the nations and territories in and around the North Pacific Ocean were represented by over 600 delegates of B. Y. M. A. in China, India, Singapore, Ceylon, Siam, Burma, the South Sea Islands, Formosa, Chosen (Korea), Japan proper, Manchoukuo, Hawaii, and Canada. Important resolutions which were passed by unanimous vote were (1) Promotion of international peace, (2) Equality of all races, (3) Organization of a Pan-Pacific Buddhist Young Men's Union, and (4) Purchase and protection of the sacred ground Buddha-Kaya, where was situated the "desert" for the founder of Buddhism.

The Hompa Hongwanji

In order to give an idea of Japanese religious bodies the Hompa Hongwanji is taken as an instance, where description follows :

History The Shin Sect sprang out of the Tendai Sect in the 13th century. The Founder Shinran (1173-1262) was a disciple of Genku of Tendai, whose head temple was in Mt. Hiyéi, Kyoto. Shinran, when he was in death bed, gathered adherents and disceples and said, "If one of you offer thanks to Amida-Buddha, you may think that another man is sitting beside you ; if two of you thank him, you may think that there are three, for I, Shinran, am always with you." It required, a long time before the adherents of Shinran found a home and got their faith recognized as an independent sect. In 1272 or 10 years after the death of Shinran a small hall was erected by his mausoleum at Ohtani, Higashiyama, Kyoto, with his image enshrined in it, and the Emperor Kaméyama gave it the title, "Kuon Jitsujo Amida Hongwanji," from which originated the common name "Hongwanji". Kakushin-ni or Iyahimé, youngest daughter of the founder, was made the guardian of the temple. The Hongwanji was still under the control of the Tendai, the mother sect.

The man who succeeded in establishing an independent sect of Shin on the foundation of Shinran's faith was the third abbot, Kakunyo. This able monk let people know that the Hongwanji maintained an independent order, distinct from all other sects, the leadership of which was to be held in strict succession by descendants of Shinran, both in faith and in blood. He went about in evangelical trips over various provinces where the disciples of Shinran were scattered and got them into the Hongwanji Order.

One who gave a great impetus to the development of the Hongwanji was Rennyo, the 8th abbot. Rennyo was born in February, 1415, and in 1457 he succeeded his father as abbot. Up to that time he had devoted his entire energy to the study of the doctrines of Buddhist sects, and realized that the doctrines of the Shin Sect were admirably suited to

Digitized by Google

the common people. He, therefore, began to write "Epistles", expounding the teachings and faith of Shinran in a most plain language, so that even the simplest seekers of the truth could comprehend what he wished to convey. The plain epistles produced the desired effect and increasing numbers of pilgrims began to pay a visit to the founder's shrine at Ohtani. This growing popularity of Rennyo, however, provoked an envious attention of the monks of Mt. Hiyéi, whose fanatic hatred finally induced them to destroy the Ohtani temple by fire in 1465.

In 1480 Rennyo built a temple at Yamashina near Kyoto, where he died in 1499.

In 1532 the Yamashina temple was again burnt in a persecution and Sho-nyo, the abbot, carrying the image of the founder with him, was compelled to retire to the branch temple at Ishiyama, Osaka, which Rennyo had erected in 1496.

The compounds of the Ishiyama temple were in such a favourable location for building a castle that Nobunaga Oda wanted the site for himself and hurled his strong army against the Hongwanji. For the ensuing ten years the Hongwanji held out against the war-lord, but the abbot Kennyo, in obedience to the Imperial order, made terms of peace with Oda and removed his temple to Saginomori in the province of Kii.

In 1591 Kennyo received from Hidéyoshi Toyotomi a tract of land, about 350 acres, at Nishi-Rokujo, Kyoto, for the re-establishment of the Hongwanji. Kennyo died in 1592 and was succeeded by the younger son Junnyo. The older son Kyo-nyo had been passed over because of his disobeyance of his father Kennyo's command to leave Ishiyama after the peace making with Oda.

Aware of the ever-increasing power of the Hongwanji, the Tokugawa Shogunate tried to split it and, taking advantage of the above incident, it gave Kyo-nyo a site for a new Hongwanji at Karasumaru, Kyoto. This was the origin of the Higashi (east) Hongwanji. The Hongwanji at Nishi Rokujo naturally began to be called the Nishi (west) Hongwanji. Another name for the former is the Ohtani-ha Hongwanji and that for the latter the Hompa or Hongwanji-ha Hongwanji, signifying legitimacy.

Present Status The number of branch temples, special branch temples, temples under its control and their branch preaching places of the Hompa Hongwanji is about 13,000. A rough estimate puts the number of monks at 30,000 and that of adherents at 3,000,000. Several years since the system of priestesses was instituted. Different from ordinary nuns they wear their hair, which can be done up in any manner and enjoy the same standing and rights with monks.

Administration The temple has its own constitution and administration. Its hereditary head is called Hossu or the head of the faith, and is responsibile to the Government for religious matters in his sect. He is a pope of Buddhism and practical handling of the affairs in and for the sect is entrusted to executors in the central administration.

The Shikko or executors are three, one of them being the Shikko-cho or the head-executor who corresponds to the premier. The organs of government are as follows :

The Executive or cabinet. The privy section, the legislative section and the intelligence section come under this.

Cultural bureau. Preaching section, educational section and social section belong to the bureau.

Business bureau. Business section and foundation section.

Digitized by Google

Financial Bureau. Treasury section, discipline section and pilgrim section.

Service bureau. Ritual section and secretary section.

Reward bureau.

Judicial bureau.

The hossu household bureau.

There is a council called "Shuyé" or congregation, which consits of 30 (minimum)—66 (maximum) members. In 1933 the number was 63, 15 of whom were appointed by the hossu and 48 chosen by the monks as their representatives. Their function is to give advice and consent to the pending rules and pass on the budget.

The Budget The 1933-1934 budget of the Hompa Hongwanji is approximately ¥2,166,000. The expenditures classified are given below:

1933-1934 BUDGET OF HOMPA HONGWANJI

(In yen)

Ordinary accounts:	
Service bureau	43,927
Cabinet	39,887
Cultural bureau	267,277
Business bureau	64,408
Financial bureau	141,887
Reward bureau	293
Judicial bureau	5,841
The hossu household bureau	100,000
Miscellaneous	39,101
Reserve fund	40,000
Total	742,621
Special accounts:	
Ryukoku University	202,738
Middle Schools	143,499
Girls' Schools	190,973
Special meetings	501,000
Other 14 special accounts	384,953
Total	1,423,163
Grand total	2,165,784

The Hongwanji has several endowment founds of which important ones in 1933 follows:

Ryukoku University endowment fund	¥1,089,709
Hongwanji supporting society fund	1,640,573
Social work endowment fund	3,755,724
Total	3,755,724
Paid-up	1,122,583
Head temple and temples mutual help endowment fund	1,570,797

Propagation Buddhism has no Sunday services, except perhaps holding Sunday Schools. The propagation of the faith is done through sermon or ritual meetings in the temples, missionaries allotted to specified districts, travelling missionaries, and preaching among convicts, factory workers, Government officers, workers in private firms, and soldiers. The propagation activities cover not only the Empire, but the pacific coasts of the U. S. A., Vancouver, the Hawaiian Islands, the South Seas, Singapore, Sumatra, China, the Maritime Province of the U. S. S. R.

Young Men's and Young Women's Buddhist Associations hold large membership and are active in the propagation of the faith. There are also the Factory Y. M. A. and The Railway Friends' Association, similar in purpose to the foregoing associations.

The Hongwanji Sunday Schools have over twenty-years' history and the numbers of schools and pupils in 1931-1932 were as follows:

	Sunday Schools	Pupils enrolled
The Empire	1,882	380,845
The U.S.A.	45	7,669
Hawaiian Islands	134	14,406
South Seas	3	—

Educational Work There are 63 schools established by the head temple and educational bodies or individuals of the sect in Japan proper. The statistics of these schools in 1931 or 1932 follow:

Digitized by Google

	Schools	Students or pupils
Schools established by the Head Temple:		
Ryukoku University	1	1,197
Woman's Colleges	3	815
Middle Schools	8	2,019
Girls' Schools	4	2,853
Seminary	1	203
Kindergarten nurse school	1	50
Schools established by educational bodies or individuals		
Middle Schools	4	762
Commercial School	1	764
Girls' Schools	32	7,645
Seminaries	16	964
Total	63	17,272

Social Work The Hompa Hongwanji plays an important part in social welfare work in the country. The Social Section of the Cultural Bureau expends about ¥52,000 annually, largely for the researches and inprovements of their social work. The number of institutions for social work in 1932 was 586:

Kind of work	Number of institutions
Nursery work	
Day nursery	133
Special nursery (open only when mothers are specially busy on the farm, etc.)	186
Economical protection	18
Poor relief	25
Medical	7
Judicial protection	92
Social enlightenment	112
Settlement work	13
Total	586

CHAPTER XXX

SOCIAL PROBLEMS AND SOCIAL WORKS

Social Problems

These may in the main be summarized under 5 headings :

(1) Poverty and Its Relief. In Japan the gap between rich and poor may not be quite so great as in some Western countries, but nevertheless it exists, and tends in some ways to become greater with the industrialization of the country. Poor-relief is one of the greatest problems of the authorities, for it must include the city slums, the beggars, and the increasing numbers of peasant paupers. Though estimates vary, the number of "poor" may be placed at about 2% of the population, and of them probably some 8% are destitute.

(2) Condition of Labourers. This, with the attendant matters of pay and hours, especially in relation to international labour conferences and agreements, calls for careful Government handling : the protection of child and woman labour particularly so.

(3) Position of Women. The protection of women and elevation of their social and legal status is in some ways especially an Oriental problem. Socially, their position has been much raised of late years, till now it approximates nearly to that of men ; but the old discriminative laws enacted in the Meiji Era still handicap women in many respects. In regard to the age-old question of licensed prostitution there has been little improvement ; statistics show, indeed, a slight retrogression, for the numbers of women involved has increased, owing perhaps to the recent financial depression.

(4) Public Health. In a country which carries such a dense population this is a matter of vital importance. Medical science in Japan is second to none in the world with regard to its recent progress and present position, her doctors and surgeons having made contributions of inestimable value to mankind, and in some cases paid for them with their lives. But difficulties attend its application. The cost of treatment and of drugs and chemicals is high, and suggestions have been made for the nationalization of all medical business in order to help the poor.

(5) Thought Guidance. The guidance of the people's thought through the eddying turmoil of modern ideas and theories, from Marxism to Fascism with all intermediate shades, and the handling of practical matters connected therewith, are of the very gravest concern to this country, and are engaging the deepest attention of the authorities. The final settlement of these matters must be largely dependent on that of the preceding problems, though some consider that more radical and direct action is necessary for its attainment than merely the so-called social work. But inasmuch as most of these movements, radical or reactionary, include schemes for the sudden overthrow of the existing social system, neither the Government nor the people at large can regard them with unconcern.

The fourth problem, relating to Public Health, is specially treated

Digitized by Google

in Chapter XXXII, while further reference is made to the others in the chapter on Labour.

Social Work

Before Meiji Era Prince Shotoku, Regent, established, in 593, Hidenin house for the poor, Sheyakuin (medicine house for the poor) and Ryobyoin (house for the sick). In 730 the Empress Komyo founded Hidenin and Sheyakuin at Nara. She herself washed the bodies of the poor and nursed the lepers.

Gyoki, a Buddhist monk who lived at the time of the Emperor Shomu (724-749), established 9 public lodging houses and a public bath house at Arima hotsprings near Kobe among other benevolent works which he established at places where he made a stay in an evangelistic journey of the country.

Hokin-in, a Buddhist nun and sister of Wake-no Kiyomaro, a famous loyalist, made an appeal for and saved 375 rebels who were sentenced to death in 764, whom she took under her care. When a little later, or at the end of the 8th century, famine stroke Kyoto and children were abandoned on the streets she gathered 83 under her motherly care. This was the beginning of orphanages in Japan and it was soon followed by the Empress Masako, consort of the Emperor Junna (823-833), who took care of many orphans and abandoned children in Kyoto. In 876 she established a leper asylum in the precinct of Daikakuji temple, Kyoto.

In 1180 Jugen, a monk, built 15 public bath houses for the poor. Kosho, another Buddhist monk, worked for prisoners, taught beggers and outcasts to refrain from drinking, instructed prostitutes in doctrines of Buddhism.

The monk Ninsho of Seidaiji temple, Nara, followed examples of Prince Shotoku and repaired houses for poor patients and lepers. For lepers he built an asylum which is still standing at Kitayama, Nara, under the Government protection as a specimen of social work of the early times. Later he became the superior of Gokurakuji temple at Kamakura and established, in 1287, an asylum for the poor. In the following 20 years the asylum accommodated over 57,250 patients, of whom over 46,800 were cured. At the foot of Kamakura hill he also built a house for sick horses.

Public baths for the poor were prevalent in the Kamakura age (1192-1337). It was during this period that nunneries were first opened for protection of women who were maltreated by husbands something in the manner of the 6 cities for refuge in Num. 35, O.T. Two of these have remained to the present day : one Tokeiji at Kamakura which was rebuilt in 1285 by Sadatoki Hojo for his mother ; the other Mantokuji in the county of Nitta, Gumma prefecture, which was established in this age and a daughter of the Tokugawas entered it in 1591. These nunneries were highly admired because of the nuns who came from warrior aristocrats and could stand against local authorities in protecting the weaker sex who took refuge in the nunneries. They became called Enkiri-dera or divorce temples.

In 1670 Tsunanori Mayeda (1643-1742), the lord of Kaga, present Kanazawa prefecture, established public lodging houses for beggars and poor patients on a hillside south of his castle in Kanazawa. The number of houses was 45, each having a size of 12 by 120 feet. 1,753 beggars and outcast were taken in with their opening. Poor travellers were given expenses at leaving and unemployed artisans were cared for till they

Digitized by Google

found suitable posts, while others were taught in petty industries. One of the latter was skilled in sword making and the masterpieces signed by the swordsmith "Hinin Kiyomitsu" or beggar Kiyomitsu are highly admired.

The blind were early protected by the Imperial House and in Nara Age the Kugas took charge of them by Imperial order and the blinds were taught to get living by music. There arose many first class blind musicians in the "biwa" or the "koto". In the Yedo Age the blind received relief money or got occupations in acupuncture and massage. In 1722 the Tokugawa Shogunate built an asylum at Koishigawa, Yedo (Tokyo) for the patients of the poorest class. Its first capacity was 40 beds, but it was later increased to 150.

Kanonko, a Buddhists' corporation, was established in 1830 by Sukenari S. Naha of Akita. Later 72 donors came to his help and the aged, invalids, the sick, the deformed and idiots were cared for. In 1930 the corporation had a fund amounting to ¥51,887 and rice 2,760 koku.

The above are representative ones picked up among numerous recorded social works in old Japan. It must also be noted that relief works either by the government or individuals necessarily followed natural calamities in all ages on a considerable scale.

Meiji Era The earthquake of Nagoya in 1891, the North-Eastern tidal wave damages and famine in 1896, had quickened the development of orphanage work, and at the time of the Sino-Japanese and Russo-Japanese wars relief work for soldiers, child protection, and free medical treatment were also being taken up. Yet they had been largely carried on by philanthropic individuals, and hardly differed from the old-fashioned benevolent and rescue work. The World War served as a great stimulus for the development of modern social work, for the economic, social and moral changes suddenly brought about at and after the time of the great conflict raised various kinds of social problems and at the same time accelerated progress in all kinds of social work, such as relief of the poor, free medical treatment, provision of houses, employment exchanges, child protection, settlement work and the like. The great earthquake of 1923 was an epoch-making event from the standpoint of the development of such work. From the beginning of the twentieth century the Japanese Government has issued many laws on social work, the most important of them being as follows :—the Military Relief Act of 1917, the Tuberculosis Prevention Act of 1919, the Employment Exchange Act and the Housing Association Act of 1921, the Health Insurance Act of 1922, and the Insanitary Houses Improvement Act and the Public Pawnshops Act of 1927.

Bureau of Social Affairs In regard to the administrative organization of social work, before the Great World War there were only a few officials engaged in reform and relief work, in one corner of the Department of Home Affairs. But in August, 1917, a relief section was established in its Local Government Bureau. In 1919, this section was given the name of the Section of Social Affairs and in 1920, it became a new Bureau of Social Affairs as a central organization for social work; in 1922, the present independent Bureau of Social Affairs came into existence and the administration of all social work throughout the country was brought under its control. The present social work in Japan is summarized in March,

Digitized by Google

1932 as follows: the existing number of social work institutions and organizations, public and private, was 6,278, with annual expenses of ¥41,769,538 and the total amount of their property was estimated at ¥215,025,943.

The present tendency of Japanese social work is paving the way for the transformation of social work into a definite Governmental social policy. While the old benevolent work had developed into the present social work, the fundamental idea and means had undergone a great change. The present social work is carried on not necessarily with the idea of benevolence but rather on the principles of social solidarity and mutual help. From the standpoint of public welfare and mutual responsibility, modern social work has as its aim the solution of social problems and positive social reconstruction to accomplish the social welfare policy in co-operation with legislation on labour and social insurance.

Imperial Participation It must be remembered here that the Imperial House has been one of the leading factors in promotion of social work in Japan. Not to speak of the Imperial gifts in olden times, the Imperial donation of ¥1,500,000 in 1907 was the commencement of modern social work in Japan on a considerable scale because it called forth contributions from the people amounting to ¥24,350,000, and a society was organized for medical treatment for the poor. The annual Imperial donation for representative social works all over Japan was begun in 1921. The Imperial House has always taken the initiative in giving a large amount of money for social works of different natures with a full understanding of the aim of modern social work. For the celebration of the birth of the Crown Prince a fund amounting to ¥750,000 was donated by the Imperial House for the protection of children and mothers of the poor. The opening celemony of the corporation Aiikukai (Loving nursery corporation) established with the fund was held in the Tokyo Kaikan at Hibiya on April 29, 1934, in the presence of H. I. H. Princess Kuni, mother of the Empress.

Administration and Expenses

Organs for the Administration As mentioned above, the Government established an independent Bureau of Social Affairs in 1922 to control all the social works and institutions in the Empire. The office is located by the moat at Marunouchi, Tokyo, and stands facing the Imperial Palace. The Bureau consists of three departments, namely, Department of Labour, Department of Health Insurance, and Department of Social Work. The social affairs of local prefectures are under the direct control of the Sections of Social Affairs which are established in Prefectural and Municipal Offices.

The most important official organization for fundamental investigation of social work is the Social Work Investigation Committee established by the Government in 1926. This Committee, composed of distinguished persons in Government service and private life, have enquired into such matters as social work system, assistance to children, improvement of insanitary living quarters, and changes in the Reformatory Law. Of the private societies for investigation of social work, the Central Charity Association was the first instance of this kind. The Social Work Investigation Association in Osaka and the Buddhists' Social Work Investigation Association in Tokyo were established in 1913, the Religious Colleges Social Work Investigation

Digitized by Google

Institute in 1917, and the Ohara Social Problems Investigation Institute and the Kyocho Kai or Labour-Capital Harmonization Association in 1919. There are 35 such organizations in Japan. Of these, the largest are the two last mentioned. The Ohara Social Problems Investigation Institute was established by the same donor, Mr. Ohara, who had been the supporter of the famous Okayama Orphanage and is engaged in an impartial and fundamental investigation of various kinds of social problems; it has a library of its own devoted to the same purpose and gives printed reports on its investigation. The Kyocho Kai has for its object the promotion of co-operation between the employers and the employed, and is engaged, in order to carry out its purpose, in the investigation and promotion of social institutions, the education of labourers and the publication of magazines and books, in the Social Policy Institute and the Kyocho Kai Hall.

Other Associations There are many associations organized for the purpose of unifying social works. The first organ of this kind is the Central Charity Association. This Association, engaging in such works as holding meetings of social workers, publication of printed matter, and investigation of social work, has contributed a great deal toward the development of such work in general. Similar Associations are organized in every part of Japan reaching to the present number of 43. There are supplementary organs for carrying out social work effectively. The most important of them is the Block Committee System. It was established to encourage the spirit of mutual aid among the people, and aims at the survey and improvement of poor quarters and the giving of suitable guidance and protection to the miserable. According to the estimate in 1931-1932, the number of the committee was 166 in all with 27,907 members and they are distributed all over Japan.

For the training of officers and workers there are 6 organs established in Tokyo and Kanagawa prefectures. The Kyocho Kai has held lecture meetings and the Central Social Work Association has held similar meetings for the cultivation of social work knowledge among the people. In 1921, the Social Work Department was established in the Tokyo Imperial University. The Japan Women's College, and the Social Work Lecture Institute in the Higashi-Honganji, a Buddhist temple in Kyoto, have worked for the same purpose. A chair of social work in the Japan University and a similar lectureship in the Tokyo Women's Union College, together with Social Work Departments in several Christian Colleges are doing a good work for the training of young people for social work.

Expenses The expenses of social work are derived from three sources, i. e., State, local and private. These expenses have increased on account of the speedy development of the work, especially since the rice riots in 1918 and the Great Earthquake of 1923. The expenses of social work in the year 1931-1932 amounted to ¥41,769,538, while the budget of local expenses for the year 1932-1933 amounted to ¥67,586,271. Besides these charges, there is special prefectural expenditure, such as Charity Relief Funds amounting to ¥9,045,728, Charity Aid Funds amounting to ¥2,489,277, and Military Relief Funds ¥2,481,199 in March, 1933. The funds created by the Calamity Fund Law totalled ¥94,388,407, in March 1933. The estimated expenses relating to the Bureau of So-

Digitized by Google

cial Affairs for the fiscal year 1933-1934 amounted to ¥21,129,413, ¥3,663,894 of which was the Government help granted to local governments for general social works.

ESTIMATED EXPENDITURES OF THE BUREAU OF SOCIAL AFFAIRS IN 1931-1935

(In yen)

Child Protection

Child protection in Japan is divided into the following nine main classes :—(1) Care for women in pregnancy or confinement (2) care for infants (3) for weakly children (4) for children of the very poor (5) for the education of children (6) for child-workers (7) for maltreated children (8) for children to be reformed and (9) for abnormal children.

Women in Pregnancy or Confinement The infant mortality rate of Japan was lower until 1900 than in Western countries, but since then it has gradually risen, till it reached the deplorable figure of 189 deaths for every 1,000 births in 1918, and though there was a decrease since, in 1933, still the rate was as high as 12.1 per cent. As for the still-birth rate, though there was some tendency to decrease, it was 5.1 for every 100 births in 1933, the total number of still-births reaching 114,138, that is, 1.8 for every 1,000 of population. The greatest em-

Digitized by Google

phasis in child protection is laid on the protection and aid of expectant mothers, or the protection of children before and at the time of birth. For this kind of work there are at present such organizations as maternity hospitals, visiting midwives and confinement advisory institutes, besides legislation for maternity protection. In 1932-1933 there were 45 maternity hospitals throughout the country, while visiting midwives organizations numbered 391. Legislation for maternity protection is included in the Factory Law, the Mining Law and the Health Insurance Law. The first two laws provide that masters of industries and mines shall not require expectant mothers to work if they apply for leave of absence; after child-birth the mother shall not be required to resume work for 6 weeks, though if she requests work after 4 weeks and a doctor certifies her as fit, she may be allowed to resume it.

According to the Health Insurance Law, persons insured are to receive 20 yen for the expenses of confinement and also a daily amount corresponding to 60 per cent. of each day's wage throughout the no-work period for 28 days before and 42 days after child-birth.

Infant Protection The institutions now existing are divided into the four following kinds :—(a) hospitals for the unweaned pauper infants, (b) day-nurseries, (c) institutions for providing milk or other nutritious food for sickly and undersized children, and (d) infant health consultation institutes.

(a) Infant hospitals. There were 19 infant hospitals in the country in March, 1933. Of these 5 were established by public authorities and the rest were managed by private bodies or individuals.

(b) Day-nurseries. The demand for this work has become greater year by year, owing to the recent development of industry and the influx of population into cities. The oldest institute for this work was the one established by Mr. Shobi Akazawa at a street in the city of Niigata, June, 1890. In May, 1933 there were 634 in the country, of which 155 were public establishments.

(c) Institutions for providing nutritious food. The work for providing milk was first undertaken by the Hygiene Bureau of the Home Office with the help of the city of Tokyo as an emergency measure immediately after the Earthquake of 1923, for those infants whose parents were quartered in parks or other places of the city. There were 6 such organizations.

(d) Infant health clinics. As the first instance of an independent organization for this kind of work, we may cite the Osaka Children's Clinic established in 1919. In March, 1933 there were 121 such advisory institutes.

Child-Protection As for the legislation for the protection of poor children, it is provided for in the part concerning children in the Regulations for Relief of the Poor promulgated on April 2, 1929. According to the national survey, made by the Bureau of Social Affairs, 1926, the number of widows and their children, and children of widowers or whose parents were destitute of daily necessities was 133,588.

(a) Orphan Asylums. The orphanage may be said to have been one of the earliest institutions that led the Japanese toward social relief work in general, as was the case with Western countries. The work has made remarkable progress and is supported by the public with better understanding and large contributions. In March, 1933, there were 127 orphan asylums in the

Digitized by Google

country of which only three were founded by public bodies. The total expenses of these asylums in 1932-1933 were ¥722,230 for 7,015 children which were chiefly met by incomes from the funds, incomes from business, subscriptions and public or private donations. Lately, however, the inmates of these asylums have a tendency to decrease on account of the development of various kinds of child-welfare work in other directions.

(b) Protection of weakly children. Physically weak children are cared for in recreation houses located near the sea or in the woods. The first example of this kind of work was that of the Tokyo Child-Nursing Institute which took a certain number of weakly children to the seashore of Boshu in 1900. Later, in June, 1926, the Child Protection Society, a corporation established in the compounds of the Bureau of Social Affairs, took up the work and has since provided a model example of it. As for the medical treatment of weakly children, the Children's Charity Hospital and the Children's Department of the Osaka Branch Hospital of the Japan Red Cross Society have been producing good results.

(c) Protection of Children of School Age. The elementary school attendance in Japan beats most of the nations of the world in its high rate. But there are a certain number of children who are kept from school partly through the operation of Article 33 of the Regulations for Elementary Schools, which recognizes as right in certain cases the non-attendance of children of school age, and partly because of poverty of the family. In March, 1933, the number of such children was 31,271. Encouragement of school attendance of those children, in some way or other, is made by the Government and various private bodies. Every year the Education Department gives Common Education Encouragement Grants to prefectures for the purpose of encouraging children to attend school. Owing to this help, the rate of school attendance of children in general has increased in a notable degree, and the percentage of daily attendance was 99.57 in the school year 1932-1933 against 99.54 in the school year 1931-1932.

The number of the schools for giving poor children compulsory education and the number of those which have evening classes for the same purpose was 38. Besides these schools there were 15 nurse-maids' schools, and the pupils of the schools for poor children were 4,599 while that of nurse-maids' schools were 451, at the end of March, 1933.

The heavy depression in farm and fishery villages stripped elementary school children of their lunch and the Government bore the expenses for their lunch for three years, from April, 1932 to March, 1935. The disbursement of the National Treasury for the purpose was ¥668,101 for 1932-33, ¥1,069,536 for 1933-34 and ¥1,481,873 for 1934-35. The number of children benefited was 425,628 in 13,865 schools during the year 1932-33, and 512,632 in 13,614 schools during the following year.

(d) Protection of Child Workers. The International Labour Conference paid great attention to this problem of protection of child workers, and its first conference in 1919 adopted an agreement relating to the minimum age of child workers employed in industries and their night work, the second Conference in 1920 an agreement relating to the minimum age of child workers at sea and the third conference in 1921 an agreement relating to the same employed in agriculture. In Japan, there had been some laws in force already,

Digitized by Google

but the International Labour Conference, and recent labour conditions necessitated the revision of these laws and regulations. The legislative measures now in force for protection of child workers are the Revised Factory Law of 1923, the Minimum Age of Industrial Workers Law of 1923, the Regulations for Relief of Miners of 1926, and the Minimum Age of Seamen and Certificate of Health Law of 1923. In the Revised Factory Law, Article III provides that children under 16 years of age and women shall not be employed more than 11 hours a day (exception being 15 hours for certain kinds of occupation), Article IV prohibits their night work, and Article VII states that they shall not be employed in dangerous work. In the Minimum Age of Industrial Workers Law, Article II provides that children less than 14 years of age shall not be employed in industrial work, but those children over 12 years of age who have finished the ordinary elementary school course shall be exempted from this rule. In the Regulations for Relief of Minors, Article VI provides that children under 16 years of age and women shall not be employed more than 11 hours a day and Article XII and XIII that children under 16 years of age shall not be employed in dangerous work. And in the Minimum Age of Seamen and Certificate of Health Law, Article II provides that children less than 14 years of age shall not be employed and Article III that in case of children under 18 years of age being employed, a doctor's certificate of health must be obtained. Just before the enforcement of these laws, that is, at the end of 1925, there were 474 children over 10 and under 12 years of age and 6,709 children who were over 12 and under 14 years old and had not yet finished their compulsory education employed in industries, but the Minimum Age of Industrial Workers Law enforced on July 1, 1926, has since prohibited their employment.

(e) Reformatory work. In March, 1900, the Reformatory Law was enacted and the establishment of prefectural reformatories was encouraged by the Government. According to this law, however, their establishment was voluntary. In 1908, it was revised and the Prefectural offices were compelled to found reformatories. Within two years after the enactment of the Law 30 reformatories were founded, both public and private. In August, 1917, an ordinance in regard to the founding of a national reformatory, which had been pending for many years, was promulgated, and in March, 1919, a State Reformatory, named the Musashino-Gakuin, was founded at a suburban village of Tokyo. The bills for juvenile courts and houses of correction, which had been pending for many years, were for the first time presented to the Imperial Diet by the Law Bureau as Government Bills, and in April, 1921, they were published as the Juvenile Law and the House of Correction Law. To meet the need of the progress of the times, however, these were revised and the Law No. 55 was promulgated in May, 1933. It is called the Juvenile Protection Law and became effective on October 1, 1934.

At the end of 1934 there were 52 reformatories, the capacity being for 2,364 children, with the estimated expenses amounting to ¥677,312 for 1934-35. In addition to these reformatories, there are 31 Correction Societies which are taking care of boys and girls who are not under the direct care of the reformatories.

(f) Protection of Abnormal Children. Blind and deaf-mute children

Digitized by Google

are taken care of in blind schools and deaf-mute schools. The importance of protecting feeble-minded and other mentally defective children has long been insisted upon by the thinking public, but the number of organizations for that purpose is only 6 in all, of which only one, that is, the Imamiya-Gakuen established by the City of Osaka, is a public one, the number of inmates being 145, in March, 1933. It is estimated that there are over 5,000 such children left entirely to the ineffective care of individual homes.

(g) Prevention of Maltreatment. The Law for the Prevention of Child Maltreatment, which was promulgated with Law No. 40 in April, 1933, states the power of prefectural governors to give adequate warning to the maltreatment of children by the people who have power over them and make provisions for putting such children under the care of suitable persons when necessary and prohibit the maltreatment of children in such performances as acrobats and the circus. It was put in force on October 1. In the half year from October 1, 1933 to March 31, 1934, the number of the children protected by the Law was 593 ; of the total 179 were from maltreatment by parents or relatives, while 414 were forced to overwork in petty shows or as street singers, geisha girls, etc.

Economic Protection

Supply and Improvement of Houses

(a) Building and management of houses by public bodies. To meet the pressing need of supplying economical and at the same time sanitary houses, in the year 1918, a note was issued to encourage public bodies to build and supply houses, the building cost of which might be loaned from the Funds of the Deposit Office of the Finance Department, at an annual interest of 4.8 per cent. The rate of interest was revised twice since and the present one is 3.2 per cent. This low-interest-rate loan together with a loan from the Reserve of the Post Office Life Insurance greatly facilitated the building work. Several other means were adopted to facilitate the work, namely, the sale of building materials produced from the Government forests at low cost, reduction in or exemption from freight charge for transportation of building materials, application of the Land Expropriation Law, if necessary, in case of buying land for the building of houses of public bodies, and freedom from the Registration and Construction Taxes. As to the result of this encouragement, the total number of houses built during the 15 years from 1919 to 1933 reached 66,486 with the total cost of building ¥111,888,940.

(b) Enforcement of the Housing Association Law. To give convenience to a number of middle-class people for building their own residences the Government issued the Housing Association Law in April, 1921, and it was put into force the same year. The association is to be a legal person possessing several privileges in respect of taxation, acquisition of land, etc., and the working funds were loaned to the associations from the Funds of the Deposit Office of the Finance Department through the prefectural offices. In November, 1933, there were 2,740 associations under the Law, owning 30,703 houses.

(c) Enforcement of the Insanitary Building Site Improvement Law. Supply of dwellings is one aspect of this question and their improvement is another. The first step taken by the Government in the latter was to improve and remake the sites in cities where poorly built houses were crowded together. A nation-wide investigation made in June, 1925,

Digitized by Google

showed that there were 217 such quarters with over 72,600 families and over 309,000 inhabitants. The land level was generally low, the quarters naturally damp, and an intricate network of unpleasant narrow roads, together with a congestion of small but not at all compact houses lacking in proper light and ventilation, made the place an unplanned hodge-podge. For the start of their programme, the Government, taking up a plan to remake such quarters existing in the so-called six largest cities (Tokyo, Osaka, Nagoya, Kyoto, Kobé and Yokohama) and in the rural districts contiguous to them, enacted in March, 1927, the Insanitary Building Site Improvement Law which was enforced in the same year. It gives directions and definitions on the following items:— agents connected with the work, quarters to be improved, temporary accommodations for the inhabitants of the quarters to be remade, readjustment of land and houses, subsidy from the national treasury, and expropriation or compulsory use of land and manufactured articles. Subsidies granted to local governments from the national treasury for this purpose amounted to ¥3,790,000 in 1927-1933. But the improvement was completed in most of cities and the budget for 1933-34 subsidies was diminished to ¥200,000.

Public Lodgings Single working men, unemployed persons and the like, as a rule, sleep at imperfectly-equipped doss-houses or cheap lodgings, or live with others. In 1925, there were 8,873 doss-houses with 92,861 monthly sojourners who had families, 200,518 single persons and 208,775 one-night lodgers, amounting to 502,154 persons in all. This situation was not at all desirable viewed from any angle, and the preparation of cheap yet healthy public lodging-houses seemed an urgent need for the welfare of labourers and the like. The number of such lodgings at the end of the fiscal year, 1932-1933, was 152 and the monthly average number of lodgers was 245,650. Of the total number of lodgings 67 are free, the rest charging 10, 15 or 20 sen a night.

Public Markets The public markets are retail markets managed by public bodies or public welfare organizations having as their aim a cheap supply of food-stuffs and other daily necessaries. According to the investigation made in November, 1921, by the Bureau of Social Affairs, the average cost of food-stuffs of the poor families in the city of Tokyo was 54.7% of their total living expenses. On the other hand, the rapid rise of the prices of commodities in the post-war period showed no signs of halting while individual incomes failed to catch up with the price level. And in August, 1918 a rice riot was started by the poor housewives at a small village of Toyama prefecture which spread over the country like a prairie fire. The situation awakened Imperial solicitude, and ¥3,000,000 was granted for relief from the Privy Purse. The Government also provided ¥10,000,000, and the amount of contributions by wealthy men and benevolent persons reached ¥25,000,000. This money was used in giving rice to the poor in the country and in opening establishments where rice was sold at lower prices. In December of the same year, the Government issued a note encouraging the establishment of public markets, and made available loans at a low rate of interest for the necessary expenses in establishing such markets. In March 1933 there were 291 such markets opened in almost all prefectures but 6, and sales for the fiscal year amounted to ¥51,280,228.

Digitized by Google

Lunch Rooms The object of the people's lunch rooms, whether attached to a public lodging-house or independent, is to provide labourers, small-salaried men and the like with simple, wholesome and sanitary meals at cheap rates. In March, 1933, there were 70 of these people's lunch rooms, most of them managed by public bodies and located in cities and towns, with 989,681 meals taken in a month. Each meal cost from 12 to 20 sen.

Public Baths Japanese people greatly enjoy their baths, but only a small proportion of them can do so in private. The majority have to utilize public baths. Moreover, it is not very infrequently the case that people take fewer baths than they require as the bath-charges are not cheap enough, and herein lies the need of sanitary, well-equipped, cheap or free public baths. The number of public baths in March, 1933 was 169, patronized by 1,959,445 bathers a month.

Public Pawnshops The pawnshop and the money-lender are utilized by the people of small means as a simple and popular means of monetary circulation. The Public Pawnshop Law was promulgated in 1927, which regulated on the subjects of managing bodies, subsidy of 50 per cent. of equipment expenses from the national treasury, loans, computation of interest and term of pledge. At the end of May, 1933, there were 529 public pawnshops, the total amount of loan reserve being ₹9,810,000. The present financial depression throughout the urban and rural districts caused unprecedented tightness of money among the salarymen, labourers and farmers of smaller means, and the need for public pawnshops became more acute. The 63rd session of the Imperial Diet gave consent to a plan for the establishment of 200 pawnshops by the Government in 1932 and the number in 1933 gained 285 over the previous year. This policy has been continued for 1934 and 1935, and the estimated amount of subsidies for the establishment of public pawnshops was ₹722,100 for 1933-34 and ₹389,013 for 1934-35. At the end of April, 1934 the number of public pawnshops was 787 with the total amount of loan reserve of ₹12,843,816.

Protection of Unemployed

Employment Exchanges There have been from olden times private employment exchanges called "Keian" or "Kuchiireya" conducted by individuals. But there were no free exchanges until 1901, when in Hongo Ward of the City of Tokyo there was established a free lodging-house for low class labourers and the unemployed, and along with this charitable work the first private free employment exchange was founded for the lodgers in 1906. The earliest public employment exchanges were established in Tokyo, in 1911. At the close of the Great War, the Home Office felt the urgent necessity of extending and developing the employment exchanges in order to meet the needs of the time. In 1920, the Office put into circulation a low-interest loan for the establishment of the employment exchanges to cope with the demands caused by an extreme business depression. And in June of the same year, the Home Office, in order to systematize the work of employment exchanges, took charge of all the affairs relating to them, and in order to extend, unite and develop them, allowed the Kyocho-Kai to start a central managing office of all the employment exchanges in the country.

(a) Employment Exchange Law. Complying with the general demand, the Employment Exchange Law was issued in 1921. According to this

Digitized by Google

Act, employment exchanges are, in principle, public organizations. They are voluntarily established and conducted by the heads of cities or towns, but in some instances the Home Minister gives orders for the establishment in places where he thinks the conditions demand it. The National Government subsidizes them to the extent of one-half of the expenses for buildings and equipment at the beginning and one-sixth or less of other expenses. One Central and several Local Employment Exchange Bureaux are to be founded for the unification of those exchanges in the country, and the work is under the supervision of the Home Minister and the Directors of these Bureaux. A standing committee is to be established to direct the management of the exchanges. There may also be established private free employment exchanges with the permission of the administrative authorities, and the aid afforded by all these employment exchanges must be free of charge.

After the enforcement of this Law, in November, 1922, the convention relating to unemployment, adopted by the First International Labour Conference at Washington, was ratified and published for the encouragement of this kind of work. In addition to the provision above mentioned, the Regulations for Enforcement of the Employment Exchange Law were revised, 1924, in order to systematize the connections among employment exchanges, and there were also newly-introduced regulations for the establishment of seasonal-employment exchanges, and of employment exchange committees in cities and towns for the promotion of this work. It is true that there are still a great many employment exchanges run for profit, but owing to the increase and improvement of public employment exchanges, they are gradually decreasing. And to conform with a resolution adopted at the Washington Conference of 1919, the National Government enforced from the 1st of January, 1927, the Regulations for the Control of Employment Exchanges for Profit.

(b) Activities of employment exchanges. In March, 1923, the Government established the Employment Exchange Bureau, and in April, the Central Employment Exchange Bureau, the Tokyo and the Osaka Local Employment Exchange Bureaux, and in April, 1927, the Nagoya Local Employment Exchange Bureau. In February, 1924, the system of the Employment Exchange Committee was introduced as an enquiry office for the administrative authorities concerned with the work. In March, 1934, there were 525 such employment exchanges, 35 of these being established by private bodies, cases handled by 455 general employment exchanges and involving workers in the shops and factories being 1,528,291 for adults and that for day-labourers reaching to the enormous number of 20,124,272, during the same year. The percentage of the hired was 41 and 83 respectively.

(c) Privileges in connection with employment. The privileges to be enjoyed by those who are cared for by public employment exchanges and the special arrangements connected with them are as follows:

(1) Reduction in fares — half third-class—is allowed for a train or steamer, (2) An advance of wages may be granted, (3) Loans may be made for expenses in travelling from the present domicile to the destination, (4) Implements for work are lent; also (5) Mutual aid systems of unemployment insurance, medical treatment and credit, (6) Occupational fitness test for the choice of work, (7) Vocational guidance lecture meetings, and (8) A low inter-

Digitized by Google

est loan, may all be availed of.

(d) Juvenile Employment Exchange. Juvenile employment has lately become one of the most important social problems which draws the serious attention of thinking people. To encourage boys and girls to choose their work according to their abilities is most desirable in view of the fact that their livelihood will thus be made secure for the future and there will be smaller danger of their losing positions. The Government has paid much attention to this point since the year 1925, and the Employment Exchange Bureaus, taking into consideration the opinions of the prefectural authorities, designated the elementary schools to be connected with Public Employment Exchanges, and held consultation meetings on this subject, calling school masters and other persons concerned to attend, and a committee for juvenile vocational guidance was to be established, composed of those officials of Public Employment Exchanges who were well informed of juvenile employment and those educationists, doctors and social workers for child protection who were well versed in child psychology.

There are three institutions for the juvenile employment guidance, namely, the Tokyo Prefectural Juvenile Employment Exchange, the Tokyo City Woman and Juvenile Employment Exchange, and the Juvenile Division of Osaka City Central Employment Exchange. Many Public Employment Exchanges include the work of juvenile employment exchange, beside these organizations.

In 1931-1932, there were 25,665 elementary schools of which 4,202 had connection with Public Employment Exchanges, and the number of cases being 212,854 and the employment rate was 41 per cent.

(e) Unemployment Relief. The Government, in 1925, asked the six largest cities and Osaka Prefecture to start public works in order to provide work for day-labourers who were suffering from seasonal unemployment in winter, and granted half of the cost for wages to labourers thus employed. This work generally concerns itself with roads, dredging, waterworks, sewers, banks of rivers, reclamation of land, necessaries for the army, etc. The local public organizations connected with the six largest cities have been engaged, since, in this work every year with the support from the Government. In 1933-1934 the result of the unemployment relief works was as follows:

	Business Expenses	Wage paid	Number of day-labour
1933-34	¥36,741,180	¥13,701,548	10,527,072
1934-35	23,974,407	7,717,699	5,857,452

(f) Vocational Guidance and Provision of Employment. The work of vocational guidance and providing employment has developed only of late years, especially since the Great Earthquake. Vocational guidance emphasizes the development of ability for employment by simple methods, while providing employment means the utilization of institutions necessary for employment. The oldest institution for vocational guidance is the Tokyo Municipal Vocational Guidance Society, which is a juridical body established in 1922, with a fund of ¥100,000 contributed to the city by the Kanegafuchi Spinning Company for the relief of the unemployed. There are now 6 institutions for vocational guidance in the country.

Institutions for providing employment are much older than those for vocational guidance. The first example was an organization established by Fukuoka prefecture, in 1884, for the purpose of giving em-

Digitized by Google

ployment to samurai families after the abolition of feudalism. This work has gradually been extended with the change of social conditions and increasing financial difficulties, and there are 73 organizations giving employment, chiefly home work for women, such as hand and machine sewing, knitting, embroidering, doll-making, lace-making, flax-thread-making, envelope-making and the like.

In connection with the work of providing employment, one word seems to be necessary about the Keisei-Sha. It is a juridical corporation, with an endowment fund of ₹1,000,000. This organization is engaged in such work as protecting the crippled, giving them employment, helping them to study, and providing them with artificial limbs. This study of the problem of providing artificial limbs by the organization is so far the only example in this country, though it has been greatly developed abroad and especially since the European War. It is believed that it will do much in the future toward the promotion of the happiness of the crippled. The homes as well as the workshops of the organization are situated in the compounds of the Asylum for Disabled Soldiers in Tokyo prefecture.

The Population and Food Investigation Committee has adopted very important resolutions, and the Government is now seriously studying the points contained in them. The most important of them are (1) to put employment exchanges under the management of the State, (2) to provide the means for prevention of unemployment and relief work by the establishment of public unemployment funds of the State and local public bodies, (3) to take some measure for the supervision and encouragement of unemployment mutual aid institutions, (4) to encourage and supervise the establishment of the systems of giving discharge allowances and of providing unemployment reserve funds (5) to encourage the establishment by industrials themselves of labour efficiency and unemployment prevention committees, and (6) to establish such organizations as an unemployment investigation committee or an unemployment investigation institute.

As for the establishment of an unemployment insurance system, the Government, besides trying to obtain exact figures about unemployment as the basis of such a system, is doing its best not only to examine the results of systems of discharge allowances, mutual aid associations and health insurance but also to make a comparative study of the legislation on this subject in various foreign countries, and when it reaches definite conclusion, intends to submit it to a labour insurance investigation committee.

Poor Relief

General Poor Relief The Regulations for Relief of the Poor were promulgated as early as 1874. The revised Relief Law was promulgated on April 2, 1924 and was put in force on January 1, 1932. The regulations maintain the old spirit of mutual help among relatives and neighbours and, at the same time, emphasize social solidarism and public responsibility of relieving the impoverished people. Those who are relieved by the law are poor old people above 65, helpless juveniles under 13, poor pregnant women, helpless invalid and cripples, those who are handicapped by sickness, wound or mental disorder, and poor mothers who are nursing infants under one year.

The period of time for relief should generally be as long as it is

Digitized by Google

required, but sometimes, especially when the case is taken up by a Block Committee, it is fixed, for example, at three or four weeks. The method of relief is of two kinds, indoor and outdoor, and as for the former, such large cities as Tokyo or Yokohama have their own homes or other relief institutions, otherwise the smaller municipalities entrust the relief of the poor to those orphanages, asylums or charity hospitals which are managed by private persons or organizations.

In 1932-1933 the number of the poor relieved was 157,072 and that in 1933-1934 was 208,570.

Special Poor Relief Special poor relief, as against general poor relief, includes (1) Proper attention for those found sick, dying or dead by the roadside, (2) Relief of sufferers from natural calamities, and (3) Relief of empoverished soldiers and their bereaved families.

Attention to the sick and dead found by the roadside is of fairly long standing, but the regulations now in force were issued in 1899; these regulations aim at relieving those people who are found sick on the road, or disposal of dead bodies, and care for the children who are with them. The heads of the cities or towns where they are found must apply to the prefectures concerned for authority to take charge of them in case there are no relations on whom they can depend. The expenses for their relief, if not met by those who are relieved themselves or their supporters, must be defrayed by the prefectures concerned, and they may be handed over to public or private institutions for further help though there is no fixed period of time.

Calamity Relief Japan suffers particularly from natural calamities owing to its climate and volcanic activities, the losses amounting to nearly ¥70,000,000 every year, from fires and floods. To relieve the sufferers from these calamities, there have been established the Natural Calamities Relief Fund Law and Sea Disaster Relief Fund Law, in 1899. The Government had promulgated the Biko Chochiku Law in 1880, according to which ¥1,200,000 each year had been paid out of the National Treasury. This amount of money had been distributed between the Central Government and Prefectures which, in addition to this national aid, and appropriated public saving funds. Consequently, the total of the funds both of the Central Government and Prefectures had been enormous. Since 1890, the disbursement from the National Treasury and the appropriations by Prefectures had been abolished and the said Laws were issued instead. At the end of April 1933, the total amount of the Funds was ¥93,334,800, and in 1931-1932 the amount of the disbursement for relief out of these Funds totalled ¥1,000,504.

With the sad experience at the time of the Great Earthquake of 1923 fresh in the public memory, Osaka and Kyoto introduced the Great Calamities' Relief Regulations soon after that terrible event, according to which the Prefectural Offices, the Municipal Offices, the Army Division, and the Gendarmerie Corps are to co-operate in cases of great emergency.

The annual number of marine disasters off the coasts of Japan is over 1,000, and the average number of persons killed, injured or missing in these disasters reaches 600 or 700 a year. For the relief of these persons, the Sea Disaster Relief Law was issued in 1899, by the terms of which the heads of municipalities are invested with certain

Digitized by Google

powers to give relief at the expense of the captain or owner of the ship concerned, but in case the money is not refunded by the captain or owner, or the relief proves insufficient, the expense incurred is paid by the National Government.

Military Relief Military relief work is different from other relief work. Its object is to give help to soldiers or their families who are suffering from want on account of military service. The method of this relief is of two kinds, institutional and domiciliary, and the law for the former is the Disabled Soldiers' Asylum Law and for the latter the Military Relief Law.

The Disabled Soldiers' Asylum Law provides for the life-time care in the Disabled Soldiers' Asylum of those who are receiving an additional pension on account of wounds received on active service or illness incurred during their term of service. The governing condition is that they must have no other source of help, but those who need such relief and suffer from deformity or disablement more severe than the kinds mentioned in Article 24, Items 1 and 2 of the Enforcement Regulations of the Pension Law, can also be taken care of. The admission of all cases shall be sanctioned by the Home Minister. There is one such asylum established by the State at Sugamo, Tokyo.

The Military Relief Law was issued in 1928. By this Act, relief is given to common soldiers who were disabled or crippled while in public service, and to their families, to the families of soldiers on active service or soldiers called out for special service and the families of soldiers who died on service if the said families are in need of help.

The cost for this relief has been increasing though the number of cases fluctuates every year. The figures for the fiscal year 1933-1934 were 30,094 households involving 98,905 persons relieved, and ¥2,702,935 expended for the purpose.

Private Military Relief The organizations for private military relief work numbered 31 at the end of March 1929, the Japan Red Cross Society and the Imperial Military Aid Society being the most prominent, and these organizations are mainly engaged in the giving of relief, generally temporary, to those who are outside the application of the Military Relief Law.

Health Protection

From very long ago, the Imperial Household has paid attention to the care of the sick. A sort of dispensary called Hospitals for the Poor were established in 593, by Prince Shotoku. The present Saisei-Kai, a foundational juridical person, established by the wish of the Emperor Meiji to give medical treatment to the poor, continues the work of these ancient hospitals.

Free Medical Treatment There are fairly many organizations which give free treatment, e. g., hospitals, medical consultation offices, visiting treatment societies, visiting nursing societies, etc. The Government decided to extend the work to farm-villages and fishing communities with ¥6,000,000, a part of which was donated by the Imperial House. It is to be continued from 1932 to 1935. There are 142 hospitals and 313 smaller branch hospitals or medical clinics, according to the statistics of 1932. In 1933-34 persons treated by the hospitals only were 895,526.

Cost-Price Treatment The Emperor Meiji pointed out, in his edict, that Japan was also experiencing an economical change with the general trend in the world, that it was most regrettable to see faithful but poor subjects suffering from illness

Digitized by Google

unable to get medical treatment, and that there was acute need to give suitable relief to them ; and he gave a large amount of money elsewhere mentioned.

The thing most dreaded by the labouring classes is sickness or injury. Once smitten by sickness or rendered idle by injury, a workman is thrown out of work no matter how much he may desire it and has no means of getting medical treatment ; his days of unemployment may be prolonged forever, and finally he may be stripped of all his possessions and his family may starve.

The Cost-Price Medical Treatment Association, a corporate juridical person, was organized on the 5th September, 1911 by the effort of Mr. Suzuki and Dr. Kato.

The Association has its headquarters in Tokyo and four branch offices in Tokyo, Yokohama, and Osaka and there are now 41 cost-price medical treatment offices established by public bodies in different parts of Japan, and 112 hospitals in which the proletariat patients are treated at cost-price.

The Do-ai (or mutual love) Hospitals in Tokyo and Yokohama, the Imperial Charity Association, the Red Cross Hospital, the Jikei (or benevolence) Association Hospital have recently begun cheap medical treatment. The Do-ai Hospitals in Tokyo and Yokohama were established with the money given by the American people at the time of the Great Earthquake, 1923, as a memorial of their kind assistance in that period of trial. Mr. Suzuki, who has played a brilliant part in the promotion of this kind of social work, is now insisting upon the national management of all medical business for the thorough protection of the life of the people in view of the unreasonable high cost of medical treatment by common practitioners and consequent loss of life and impoverishment.

Sanatoria, Asylums and Special Hospitals We find a regulation concerning mental disease in the Taiho Laws issued in 701. But the number of sufferers increased in direct proportion to the advancement of civilization. Our statistics record the fact that at the end of 1912 there were 32,964 insane persons, by the end of 1922 the figure rose to 50,891, and in 1933 it stood at 76,039, an increase of 2,499 as compared with the preceding year, the ratio is 11.31 in every 10,000 of the population, an increase of 0.22 as compared with the preceding year.

(a) Laws and regulations concerning insane persons. The Law for the custody of Insane Persons was enacted in 1900, with the object of protecting the public from harm at the hands of insane people. It provides for the appointment of a responsible person to place an insane person under his custody, and if necessary, by the approval of the prefectural governor, to confine the said insane person. The expenses, according to this law, shall be borne by the estate of the insane persons themselves or by proper responsible persons, as the case may be, and in case any insane person protected by the order of the head of a municipality is unable to reimburse the money advanced by the municipality, the prefecture shall bear the expenses.

The Insane Asylums Law, which may be taken as a sub-division of the previous one, gives power to the competent Minister to order and bring prefectures, if necessary, under obligation to establish insane asylums or hospitals (Art. 1), and makes provisions concerning the state subsidy.

(b) Present condition of insane

Digitized by Google

asylums and hospitals. At the end of 1933 there were 8 public hospitals for the insane and 112 private asylums, with combined capacity for 15,996 patients. At the end of 1933 there were 5,070 in-patients in these hospitals and asylums.

(c) Tuberculosis. It is almost impossible to get the exact number of the cases of tuberculosis in this country, but the ratio of patients per 1,000 of the examined in accordance with the provisions of the Law for the Prevention of Tuberculosis was 0.26, a decrease of 0.05 as compared with the previous year, and in 1932, there were 87,427 killed by pulmonary tuberculosis, that is 74.4 in every 1,000 deaths, the highest ratio for these five years. The Government issued regulations, 1914, concerning the establishment of tuberculosis sanatoria in cities of more than 30,000 population, and regulating the state subsidy thereto. The present Tuberculosis Prevention Law was enacted in 1919.

(d) Leprosy. For the prevention of leprosy, the Leprosy Prevention Law was issued in 1908. By this law, aid for indigent lepers out of public funds, the order of the competent Minister for the establishment of leper-asylums by united prefectures, or the use of private ones in lieu of public ones and other such matters are provided for. The whole country, in conformity with this law, was divided into five Divisions numbered one to five. Besides these 6 public leper-asylums, there are 7 private ones. The Koyama Fukusei In, established by the Roman Catholic Church in Shizuoka prefecture, the Ihai En in Tokyo prefecture, the famous Kumamoto Kaishun Byoin founded by an English lady, Miss Riddell, and the Tairo In in Kumamoto prefecture have done valuable work for many years, being managed by Christian missionaries. (See Chapter XXXII on these subjects.)

STATISTICAL TABLE OF SOCIAL WORKS IN JAPAN

(The fiscal year 1932-1933)

The Red Cross Society of Japan

Red Cross Work before Meiji Era

The spirit of Japanese warriors was humane and their way of fighting against each other never evidenced such brutal cruelty as it was often seen in the battles in other countries. The oldest record of Japanese samurai spirit is the order issued by the Empress Jingō, in 200 A. D., when she conquered Korean peninsula. A paragraph of the order says: Neither be careless of a small body of the enemy, nor be afraid of a strong army; be relentless against the tyrannical, but be kind to the meek and obedient.

In 947 the ex-Emperor Suzaku pacified the spirits of both the government army and the rebellious in a great memorial service at Enryakuji temple.

After the Yuan Invasion in 1274 and 1281, a temple named Koraiji was established in a village near Fukuoka in memory of the Mongolian soldiers who perished in the Korean straits. It was protected by the Imperial House for some time, but it is now extinct. At present two mounds remain in the neighbourhood, of the old precinct of the temple. One is called Mōko Sennin Zuka (Mound for 1,000 Mongolians) and the other Mōko Mannin Zuka (Mound for 10,000 Mongolians). Each of them has a height of 3 metres and occupies an area of 1.5 ares. Tokimuné Hōjō, the chief executive of the Kamakura Shogunate, enshrined 1,000 Ksitigarbhas in Enkakuji temple of Kamakura to the memory of the Japanese and Mongolian soldiers who perished in the battles.

In 1597 Hideyoshi Toyotomi who sent armies to Korea buried parts of the Korean soldiers in a mound called Mimi Zuka (mound of ears) at Higashiyama, Kyoto, with an elaborate ceremony. In 1598, in the battle at Shisen, Korea, Yoshihiro Shimazu, a general of the Japanese army sent by Toyotomi, protected Korean people from the unguarded attack of his own soldiers and in 1599 he built a splendid tomb for Japanese and Korean soldiers at Kōya mountain, one of the most famous Buddhist holy places in Japan. Prisoners taken back by his army were humanely treated and given land, and many of them remained in Kyushu as potters. Another general Kiyomasa Katō took two young Korean princes, their consorts and attendants, prisoners, but treated them for full one year as guests in his camp in Korea and sent them back to Seoul in safety, for which act Korean princes left a letter of thanks with him.

The Japanese take sympathy with the wounded or killed in battles, those who sacrificed their lives for others, or things which served their useful purposes. Characteristic examples of this may be seen in many kinds of little religious ceremonies for the dead or used-up things, for instance, Harikuyō (ceremony for sewing needles), Kuyō for carcasses (of men and animals) used for autopsy. Harikuyō is celebrated by women, dressmakers or "tabi" (Japanese socks) makers who are great users of needles on February 8 (in some districts on December 8) every year. On that day those who observe the ceremony keep a holiday, gather old needles, pin them into bean-curd and present it to Awashima shrine, or gather all the old needles in the needle cushion, put them into folded paper, and place them on the "tokonoma" and present Japanese dumplings to them. Kuyō for carcasses is kept by medical colleges.

There were innumerable battles fought between warrior lords in all

ages and periods of the Japanese history and many stories of philanthropic dealings of enemy soldiers are recorded in books and documents.

Present Status The Red Cross of Japan which owes so much to the high patronage of the Imperial House, and which can fairly claim that it enjoys the support and appreciation of the whole nation, has every reason to be proud of the advance it has made since 1930. The Society now shows a membership of 2,700,000 adults, of whom 170,000 are new members, induced to join following the institution of "Red Cross Day" in Japan. Between 1930 and 1933 the disaster sufferers who received aid from the Red Cross Society of Japan numbered 3,300. An activity not previously attempted in Japan—the institution of first aid posts on highways—was started during this period, four experimental posts being set up; and the success of this experience leads the Society to anticipate developing it on a nationwide scale. Besides this 1,300 new first aid chests have been distributed.

As examples of the health work of the Society may be cited the treatment given to 13,000 tuberculosis patients and to 36,000 expectant mothers. The statistics of consultations given in the Society's child health centres show 18,000 such consultations every year.

Nursing Schools Opened Two new nursing schools have been opened in connection with hospitals, and the number of the Society's nurses has risen by 1,100 to a total of 6,300. As from the year 1934 the educational standard for Red Cross nurses has been raised, and only girls who have finished secondary schools are admitted as probationers in Red Cross nursing schools.

The Junior Red Cross in Japan shows 1,200 new groups and 450,000 new members. The total Junior membership in the country is now over two million, divided among 7,300 groups. The active participation of the Japanese Juniors in disaster relief work is an important development to be noted. Since 1930 they have collected ₹37,000 for disaster victims and made 850,000 gifts in kind to disaster sufferers. As regards international school correspondence, the quality has continuously improved. The number of exchanges each year is about 2,000, and the countries with whom correspondence is carried on, has risen to 34.

The 15th International Red Cross Convention

The 15th International Red Cross Convention was held in October, 1934, in the Red Cross Building at Shiba Park, Tokyo. Delegates sent from overseas countries arrived in Japan in September and the early part of October.

Delegates Notable ones and those whose names were specially familiar to Japan were Mrs. John Allan Dougherty of Washington, D.C.; Judge John Barton Payne, chairman of the Red Cross of America and chairman of the Board of Governors of the League of Red Cross Societies; H.R.H. Charles Edward, Duke of Saxe-Coburg and Gotha and chief delegate of the German Red Cross; Dr. Rodolfo Espinosa, vice-President of Nicaragua; the Reverend W. Coleman Nevils, President of Georgetown University; Colonel Guillaume Favre, vice-President of the International Committee; H.E. Professor P. Nolf, President of the Belgian Red Cross, Lt.-General Sir Harold Fawcus, Director-General of the British Red Cross Society; Dame Rachel Crowdy, L.L.D. of England; Lt.-General J.C. Diehl, lately Director of the Medical Services of the Army of

Digitized by Google

the Netherlands; Phya Rajanakul, Secretary-General of the Siamese Red Cross; Baron E. Stjernstedt, Secretary-General of the Swedish Red Cross; and Mr. Christian Rakowsky of the U.S.S.R. Fifty-seven nations were represented by 247 delegates, most of them being specially sent for the occasion, the U.S.A. led in number with 57.

On October 16, most of the delegates attended the 42nd National Convention of the Red Cross Society of Japan held in the Constitution Memorial Hall in Gondahara, Tokyo. In the presence of the Empress 13,000 delegates and guests from all over the country were gathered together and listened to the Imperial Message desiring a greater contribution of the Society toward the welfare of mankind.

Preliminary The business of the International Conference was inaugurated on October 17, with a meeting of the Executive Committee of the League of Red Cross Societies at the Japan Red Cross Headquarters, Shiba, Tokyo, and on the 18th the Board of Governors unanimously adopted a resolution inviting the alliance of the Red Cross and the Red Crescent Societies of the Union of the U.S.S.R. to the League by the motion made by Prince Iyesato Tokugawa, thus bringing the total membership to 61 national societies. On the 19th, the Board of Governors and the Board of Delegates discussed many matters of importance such as official acceptance by Soviet Russia of the invitation, acceptance of the financial report of the League presented by Mr. Ernest J. Swift, Secretary-General, and of the budget of 2,500,000 francs for 1935, election of Colonel Guillaume Favre, Vice-President of the International Red Cross Committee, and Dr. J. Max Olano, President of the Salvador Red Cross, as President and Vice-President respectively of the Board of Delegates, recommendation of the appointment of Prince Iyesato Tokugawa as President of the 15th International Conference, and a proposal by Marquis Jose Valdey of Spain, with the agreement of the Board of Delegates, to name Madrid as the seat of the 16th International Red Cross Conference in 1938.

Opening Session In the presence of Imperial Prince Kanin, and with Premier Okada and other Cabinet members in attendance, the opening session of the Conference was held in the Japan Red Cross building at Shiba, Tokyo, on October 20. The meeting was opened with Prince Tokugawa's welcoming address; Field-Marshal Imperial Prince Kanin then read the Imperial Message of the Empress. Other speakers of the day were Colonel Favre, Professor Nolf and Judge Payne. During the first plenary session vice-presidents, the secretary-general and secretaries of the Conference were elected.

On October 22, the second plenary session was convened and significant among the points taken up were the general report of the Committee, the report on the funds, adoption by the body of a resolution giving approval to the Council of the Red Cross Committee Foundation inviting governments which are parties to the Geneva Convention to grant the Foundation subventions sufficient to increase the endowment, and a general report of the League of Red Cross Societies. The International Committee's report stated that national societies are advised to redouble their vigilance to prevent abuses of the Red Cross emblem. In the past four years the research service of the Committee had handled 2,019 cases for its members and many more for other organizations and official bodies. The report said in

Digitized by Google

conclusion that the International Committee was labouring under the difficulty of insufficient funds to pursue its numerous activities. The Marquis de Casa Valdes moved that full approval be given to the constitution of the foundation to place the International Committee on a sound financial basis, and suggested the advantages of capital contributions over annual dues and that if all the members of every national society could contribute a cent the Committee's finances would be placed on a stable basis. The resolution was approved by the Conference.

In the course of the general report the importance of the Junior Red Cross was emphasized. In the afternoon session the Russian delegate delivered a speech on the duty of the Red Cross to make every effort to prevent war, and introduced a resolution.

The third plenary session, on October 25, unanimously approved 13 resolutions, presented by Commissions.

Welcome by the Japan Junior Red Cross In the afternoon of October 25, five thousand boys and girls of the Japan Junior Red Cross from every school district in Japan gathered in the Hibiya Amphitheatre to honour the delegates to the Conference. Their motto for the day was "The Red Cross of Tomorrow Welcomes the Red Cross of To-day". It was the first of its kind ever held at an International Red Cross Conference. Every delegation of young Red Cross workers brought gifts from its section of the country and colour prints, scroll paintings, wood carvings and dolls were given to the delegates. Miss Yoshiko Oishi of the First Higher Elementary School of Kyoto sounded the keynote of the gathering when she said, "We are eager to do whatever we can to make the world brighter; to help relieve the suffering of the world. We realize that very soon the young people of to-day will be sharing the responsibilities that are now upon your shoulders. We want to ask you to help us so that we can all work together with new courage and new faith." The singing of "The Red Cross of Japan" and enthusiastic "Banzai" with which the bright-faced boys and girls bid farewell seemed to leave a lasting impression upon the hearts of the delegates.

October 26 was the last business day of the Conference which passed all the resolutions proposed by the Commissions, the number of resolutions passed reaching 35 in all.

Closing Meeting The closing meeting was held on October 29 and the delegate decided, by an unanimous vote, to have the sixteenth International Red Cross Conference at Madrid, Spain in 1938. Prince Iyesato Tokugawa reported the Empress' donation of ¥100,000, and the Conference ended with a record of having emphasized more than any previous meeting the importance of the Red Cross as a factor in the improvement of international relations.

Resolutions Important resolutions adopted were as follows:

Resolution on the Junior Red Cross

The Fifteenth International Red Cross Conference,

Expressing its satisfaction with the development of the Junior Red Cross, which is playing an increasingly important part in the physical and moral training of boys and girls and constitutes a valuable pledge for the future of the Red Cross movement throughout the world;

Considering that the creation of a Junior Section in each national Red Cross Society is the first step which should be taken in establishing the Junior Red Cross, and that each such Section should aim at enrolling all primary and secondary school pupils in the country;

Considering also that most national Societies now have Junior Sections, and that they have

Digitized by Google

been able to judge of the value of the activities of these Sections for the Red Cross as a whole;

Recommends that the national Societies support and extend the activities of their Junior Sections by all the means at their disposal and that Societies which have not already done to organize Junior Sections without delay, in conformity with the directions given in the XIVth Circular of the International Red Cross Committee and the League of Red Cross Societies, basing themselves upon the experience of other Societies and upon the advice of the League Secretariat.

Resolution Against Poisonous Warfare

While noting that since the Fourteenth Conference the number of Governments which have ratified the Geneva Protocol of June 17th, 1925, concerning the prohibition of the use in war of asphyxiating poisonous or similar gases, and of bacteriological methods of warfare, has considerably increased;

Recommends that the International Red Cross Committee continue its endeavours to secure the ratification of the said Protocol, or adhesion to the said Protocol, by all countries which are parties to the Geneva Convention,

Thanks the International Committee for the initiative which it has taken in order to develop in time of peace and in time of war measures for the protection of civilian populations against poisonous gas,

Expresses the hope that the International Committee will be placed in the position to continue the technical investigations which it has already undertaken in spite of the difficulties of all kinds confronting it,

Approves the activities of the Documentation Centre, and invites national Societies to give their financial assistance to the International Committee in order to contribute to the development of this centre,

Notes the conclusions of the International Commission of Jurists of 1931, and expresses the hope that the studies of this Commission will be continued with a view to finding means for the legal protection of the civilian population against the dangers of aerial warfare in its various forms.

Resolution on Conflicts Without Declaration of War

Having taken cognizance of the report of the International Red Cross Committee,

Considering the regrettable consequences which might result from a too literal interpretation of the Geneva Conventions and of the Convention relative to the Treatment of Prisoners of war of July 27th, 1929, in the event of military, naval or air operations unaccompanied by a declaration of war,

Considering that these operations, whatever may be their interpretation in international law, their motives or their purposes, cause the same destruction as declared wars,

Expresses the hope that the said Conventions which have been established for the circumstances of a declared war, will also be applied by analogy in the case of armed conflicts between States without declaration of war.

Resolution on the Progress of I. R. C.

Noting with approval that during the past four years the number of national Red Cross Societies and the aggregate of their membership have continued to show progressive increase,

Expresses its appreciation to all who have contributed to strengthen the movement by their leadership, both in the national and in the international field,

Expresses the hope that this development will continue, and in particular that the Red Cross Societies of countries possessing overseas dependencies or administering Mandated Territories will continue to give special attention to the possibilities which the Red Cross offers as a means of protecting the health and improving the conditions of subject populations,

Requests the International Red Cross Committe to study, jointly with the Secretariat of the League of Red Cross Societies, the question of Red Cross development in Territories under Mandate, and to transmit to the National Societies concerned their recommendations, regarding the lines upon which Red Cross development in such territories can best be stimulated,

And recognizing that regional Red Cross Conferences are of outstanding value during a period characterized by an important evolution in Red Cross work which is occurring as the result of changes in social and economic conditions, expresses the hope that the League of Red Cross Societies will go forward with its regular programme of regional conferences in close consultation with the national Societies concerned in each case.

Resolution on an Antiwarfare Movement

Having regard to the resolution of earlier International Red Cross Conferences, and especially to the resolutions numbered 7 of the Eleventh (Geneva) and 25 of the Fourteenth (Brussels) International Conference, declaring that the Red Cross, without losing sight of its usual wartime and peacetime activities, must exert every effort, within the sphere of its attributions, to prevent war,

And considering that the progress made in the technique of warfare creates ever increasing difficulties of the Red Cross,

Expresses the wish that all national Red Cross Societies, while continuing, as during

Digitized by Google

the past, to spare no effort in order to safeguard the lives of millions of men, to protect other millions from suffering and privations, as well as to prevent catastrophies which threaten to destroy the intellectual and material wealth accumulated through the centuries, amplify their action against war and in favour of a better understanding between nations by every means at their disposal.

The members of the Standing Commission for 1934-38, which will prepare the groundwork for the 16th International Red Cross Conference in 1938, are Prince Iyesato Tokugawa of Japan, Sir Arthur Stanley of Great Britain, Lieutenant-General Ricardo Burguete of Spain, Refik Bey of Turkey and Dr. Alvaro Turino of Brazil. All of the members are Presidents of their respective national Red Cross Societies.

The Budget for 1934 was brought down from $230,000 (5¾ million French francs, the figure authorized in Brussels for the year 1931) to 105,500 Gold Dollars (2,637,500 French francs).

The League Headquarters was changed from 2, Avenue Velasquez, to a new building in Paris at 12, rue Newton, near the Place de l'Etoile.

CHAPTER XXXI

LABOUR AND LABOUR MOVEMENTS

Labour

Vocational Classification

Statistics classifying the population according to the kinds of work done can be obtained only from the Report of the National Census of 1920. (A tentative report based on the 1930 census is given in Chapter II.) According to the census report the people in Japan proper may be classified according to their occupations as follows:

Occupation	Number	Percentage of whole
Farming	27,138,251	48.5
Marine industry	1,449,674	2.6
Mining	937,525	1.7
Industry	10,737,940	19.2
Commerce	7,312,593	13.1
Transport	2,549,472	4.5
Public service (Casual)	3,208,355	5.7
Miscellaneous	1,091,275	1.9
Domestic service	40,425	0.1
Unoccupied	1,497,543	2.7
Total	55,963,053	100.

According to the investigation made by the Labour Section of the Bureau of Social Affairs the classifications of labourers according to kinds of occupation at the end of 1934 was as follows:

Factory workers	2,539,384
Mine workers	247,186
Transport and communication, day-labourers and others	2,977,707
Total	5,764,277
Male	4,066,322
Female	1,697,955

Labour Conditions

Factories and Labourers The number of factories where more than 5 operatives are employed, in Japan proper in 1914 was 31,717. It was more than doubled in 20 years, the figure for the end of 1933 being 71,940.

The number of factory labourers in 1933 was 1,901,091 (967,659 males, 933,432 females), gaining 167,580 or 9.7 per cent. over the previous year. Classification of the same according to kinds of industry follows:

			Sex distribution	
	Number	Percentage	Male	Female
Textile industry	907,631	47.8	170,581(18.8%)	737,050(81.2%)
Metal industry	125,652	6.6	115,602(92.1%)	10,050 (7.9%)
Manufacturing of machines, tools, etc.	249,328	13.1	228,540(91.7%)	20,783(8.30%)
Ceramic industry	71,195	3.8	57,930(81.4%)	13,265(18.6%)
Chemical industry	163,706	8.6	106,272(64.9%)	57,434(35.1%)
Lumber industry and making of wooden manufactures	66,439	3.5	60,815(91.5%)	5,624 (8.5%)
Printing and binding	53,679	2.8	47,531(88.5%)	6,148(11.5%)
Food stuff industry	142,237	7.5	117,638(82.7%)	24,599(17.3%)
Gas and electric industry	8,320	0.4	8,257(99.2%)	63 (0.8%)
Miscellaneous industry	112,909	5.9	54,493(48.3%)	58,416(51.7%)
Total	1,901,091	100	967,659(50.9%)	933,432 (4.9%)

	Age distribution		
	Under 16	16–49	Above 50
Textile industry	149,716(16.5%)	749,481(82.6%)	84,34(0.9%)
Metal industry	2,782 (2,2%)	119,718(95.3%	3,152(2.5%)

Digitized by Google

	Age distribution		
	Under 16	16–49	Above 50
Manufacturing of machines, tools, etc.	9,559(3.8%)	233,951(93.9%)	5,813(2.3%)
Ceramic industry	2,556(3.6%)	65,371(91.8%)	3,268(4.6%)
Chemical industry	7,259(4.4%)	152,185(93.0%)	4,262(2.6%)
Lumber industry and making of wooden manufactures	1,839(2.8%)	62,145(93.5%)	2,455(3.7%)
Printing and binding	2,389(4.4%)	50,128(93.4%)	1,162(2.2%)
Foodstuff industry	2,421(1.7%)	135,868(95.5%)	3,948(2.8%)
Gas and electric industry	5(0.1%)	8,003(96.2%)	312(3.7%)
Miscellaneous industry	7,199(6.4%)	103,298(91.5%)	2,412(2.1%)
Total	185,725(9.8%)	1,680,148(88.4%)	35,218(1.8%)

In 1933 the industrial world was rather active in general with the unusual expansion of Japan's foreign trade. The percentage of employment and income of labourers showed an increase; and together with the general cry for patriotism or Japan Spirit which put down the power of the left movements of labour unions these conditions naturally led labour controversies to reduce in number, and capital and labour seemed to be in a harmonious relation.

The real wage or real value of labourer's income, however, went down on the contrary and their living condition has hardly improved in any material degree.

Employment and Unemployment According to the survey of the Bank of Japan the index number of employment began to rise since the beginning of 1932, and in October, 1934 it was 94.1 increasing 9.8 per cent., as compared with the same month of the previous year. It arose to 95.8 in January, 1935.

The number of unemployment at the end of 1934 was 360,000 or 4.80 per cent. of 7,517,000, the total number of salarymen and labourers among whom the investigation was made. It is 18,000 less than in the previous year while the percentage is 0.31 lower. Details follow:

	Number of unemployment	Percentage of unemployment
Salarymen	67,000	3.88
Day labourers	176,000	9.89
Others	116,000	2.92
Total	360,000	4.80

Wages According to the investigation made by the Department of Commerce and Industry the average wage of factory labourers per hour was 12 sen, in 1933. The cheapest was 7 sen of textile industry labourers who contain a large number of women and juvenile workers, as shown in the above table. Details follow:

	Aggregate labour hours	Total amount of wage (in yen)	per hour wage (in sen)
Textile industry	2,599,851,096	190,767,980	7
Metal industry	372,269,184	71,512,314	19
Manufacturing of machines, tools, etc.	750,924,389	153,327,587	20
Ceramic industry	197,125,497	28,199,958	14
Chemical industry	479,950,976	66,440,693	14
Lumber industry and making of wooden manufactures	188,890,613	24,003,488	13
Printing and binding	164,578,811	33,937,592	21
Foodstuff industry	302,897,411	40,170,088	13
Gas and electric industry	33,402,376	7,230,556	22

Digitized by Google

	Aggregate labour hours	Total amount of wage (in yen)	per hour wage (in sen)
Miscellaneous industry	310,271,021	31,749,943	10
Total and average	5,400,161,374	647,340,199	12

The index number of labourers' wages was still falling, according to the survey by the Department of Commerce and Industry on the average wage of the labourers in the 13 largest cities in 1933. The index number in 1933 was 82.3 or 0.4 per cent. lower than in the previous year, and was the lowest record since 1921. The 1934 index number has shown a reaction and is 82.8 or 0.5 per cent. higher than in the previous year. (The average wage in the period 1921-1923 is taken as 100.) The downward steps of the past ten years are shown below :

INDEX NUMBER OF WAGES

(Compiled by the Department of Commerce and Industry)

Comparison of Wage and Price The true valuation of wages has to be derived out of the comparison between wages and prices. The following tables compiled by the Department of Commerce and Industry are given for such comparison. Upon reading the table it may be said that wages go fairly well with prices in general, with the only exception in 1933. (See Chapter X for prices.)

STATUS OF THE INDEX NUMBER OF WAGE AGAINST THAT OF PRICE, 1930-1934

(December, 1929=100)

		Wage	Wholesale price	Retail price	Real Value of Wage: Wage÷Wholesale price×100	Real Value of Wage: Wage÷Retail price×100
1930	Average	95.2	87.7	91.1	108.6	104.5
1931	„	86.8	74.0	79.4	117.3	109.3
1932	„	83.7	81.0	79.7	103.3	105.0

	Dec.	85.7	97.5	89.3	87.9	96.0

Working Hours The working hours are being reduced at least legally. After July, 1929, night work for women and children was abolished in factories under control of the Factory Law, and the hours were shortened in the spinning and weaving industries. By the revision of the Factory Law in the same year, the limitation of hours was also enforced in such factories as employ 10 workers or less. Moreover, the 11 hour day in the silk industry was changed to one of 10 on July 1, 1930. Thus the hours are legally decreasing, but as a matter of fact, there is not much actual shortening, for grown up men work beyond the regular hours for additional wages, while factory owners often dismiss regular labourers and hire cheaper day labourers, or as an alternative require the regular men to do extra work. The average number of working hours in factories in 1933 was 11 per day with 0.55 hour of recess included.

Labour Calamities and Mortality In 1932 the number of labourers injured while at work in factories was 39,107 and deaths numbered 277.

CALAMITIES IN FACTORIES IN 1932

Private factories	Death	Severely wounded	wounded	Total

Marine Accidents The number of fishing boats and vessels without engines wrecked in 1933 was 12,083 and that of vessels with engines 1,444, increasing 9,844 and 674 respectively as compared with the previous year. The number of crews wrecked with those boats and vessels was 5,829, increasing 3,608 on the previous year. 714 of the total were perished or missing. The enormous increase of marine calamities in 1933 is largely due to the earthquake and tidal wave in March at the north-eastern shores (Sanriku districts) of the Main Island.

MARINE ACCIDENTS

	Total number of fishing boats and vessels	Fishing boats and vessels wrecked		Total number of fisher men	Crews on the wrecked boats and vessels		
		Without engine	With engine		Perished	Survived	Total

Labour Hygiene The hygienic equipment of factories is legally required, but its progress and improvement is rather slow and partial. In compliance with the requirements stated in the new ordinance on labour hygiene, factory managers are endeavouring to make improvements under the guidance of the Government and prefectural authorities, and good results have been reported as to the health of factory labourers. (See Chapters on Agriculture, Fisheries, and Mining also.)

Labour Movements

Labour Disputes

According to the survey by the Bureau of Social Affairs the number of labour disputes in 1932 was 1,926 cases with 98,850 perticipants. The figures for 1933 were 1,897 and 116,733 respectively. The decrease in the number of cases is the result of a better labour condition in 1933

Digitized by Google

as mentioned above and the increasing influence of patriotic, harmonious labour unions who have taken the place of radical unions.

The characteristic nature of the 1933 disputes was in the increase of positive demands. In contrast with the decrease of the number of negative implores for not to lower wages from 257 to 110 as compared with the previous year, demands for better wages increased from 354 to 576.

LABOUR DISPUTES

	1932 cases	1933 cases

Tenant Disputes

Tenant disuptes which have become more and more numerous since 1927 increased enormously in 1930 and numbered 2,478 cases. This increased to 2,689 in 1931, and 2,763 in 1932. In 1933 the number reached to 2,677. Contrary to the increase of the number of cases the area involved and number of participants are decreased; that is, the disputes occur not so much on farm rent as on tenant rights. It should be also noted that the disputes by union movements are decreasing while those between individuals are increasing. Important disputes in 1932 are 1,379 cases (62% of the total) on the return of tenanted land, 339 (15%) because of bad crops, 209 (9%) on the delayed payment of farm-rent. Strongest demands are 1,300 cases (59%) for the continuation of tenancy and 537 (24%) for the reduction of farm-rent. The increase of fundamental demands such as the continuation of tenancy and the recognition of tenant or long-term tenant rights reflects the profound land famine caused by the difficulty of farmers to leave farm land and the return of unemployed workers to villages.

TENANT DISPUTES CLASSIFIED ACCORDING TO CAUSES

	1931		1932	
	Cases	Percentage	Cases	Percentage
Raising of farm-rent	43	1.3	50	1.8
Payment of farm-rent	77	2.3	16	0.6
Bad crops caused by natural forces	1,171	34.3	741	26.9
High farm-rent	97	2.8	52	1.9
Lower price of farm products	240	7.0	46	1.7
Excessive cost of production	13	0.4	7	0.2
Meager income of tenant farmers	45	1.3	7	0.2
Disorder of farm-rent	1	0.1	2	0.1
Copying of method	96	2.8	24	0.9
Return of tenanted land	1,307	38.2	1,326	48.1
Arrearage of farm-rent	174	5.1	266	9.7
Others	153	4.4	219	6.9
Total	3,419	100.0	2,756	100.0

Outcome Of the 2,756 disputes in 1932 953 were left unsettled. Of the 1,803 settled ones 1,380 ended in compromise.

Tenant Disputes in 1934 According to an investigation made at the

Digitized by Google

Ministry of Agriculture and Forestry, the number of tenant disputes that occurred during the year 1934, was more than 4,500, majority cases of which being disputes arising out of the attempt on the part of landowners to take over their farms from the hands of tenant-farmers. Other causes of the disputes were bad crops, defaults in the payment of tenant fees, increased attempts on the part of landowners to farm the lands by themselves, sales or public auction sales of the tillages without notice to the tenant-tillers and the consequent increase of tillage rent. A noticeable feature is the increased difficulties in the solution of the disputes. Another thing to be noted was the increased number of persons involved in the disputes, as compared with previous several years. The same tendency was seen in the sphere of territories affected by unseasonable heat or cold and typhoon and flood. Figures follow:

	1934 Number of cases	Increase over the Number in 1933	percentage of increase
Because of bad crops	986	432	78.0
Because of increase of rent	2,503	529	26.8
Defaults in the payment of rent	465	63	15.7
Others	630	176	38.8
Total	4,584	1,200	35.2
Number of landowners involved	19,503	7,867	67.6
Number of tenant-peasants involved	66,529	29,306	78.7

	Area of Farms Affected (Cho)	Area of Farms Affected (Cho)	
Rice-fields	36,783	18,327	99.3
Upland-farms	4,952	503	11.5

Both landowners and tenant-peasants have their own respective associations, the number of which follows:

	Number of Associations	Members
Landowners' associations	633	48,836
Tenant-peasants' unions	4,390	276,246
Mutual cooperation asociations	2,222	271,434

Tenant peasants' unions were very inactive in recent years, but owing to the growth of various mishaps in 1934 which gave indications of exceptionally bad crops they became suddenly heated, and active measures were taken. Meantime, landowners' associations remain inactive and they are conciliative in their attitude.

Labour Unions

Labour unions can be conveniently divided into two types, (1) those of factory, mine and transport workers, and (2) those of farmers.

The first type, that is to say, the movement of labourers in factories, mines and transport makes the central part of the whole labour movement, and an investigation on their organization and activities reveals the general trend of the labour movement in this country.

The number of organized unions in Japan was, in 1932, 932 with a membership of 377,625. In comparison with that of the previous year, it shows an increase of 114 unions and 8,650 men.

LABOUR UNIONS

(Compiled by the Bureau of Social Affairs)

	Unions	Members	Total number of labourers	Union percentage
1924	469	228,278	4,245,619	5.3
1925	457	254,262	4,485,810	5.6
1926	488	284,739	4,641,681	6.1
1927	505	309,493	4,703,757	6.5
1928	501	308,900	4,824,780	5.3
1929	680	330,985	4,873,081	6.8
1930	712	354,312	4,713,002	7.5
1931	818	368,975	4,729,436	7.9
1932	932	377,625	4,860,276	7.8
1933	942	384,613	5,126,719	7.5

Farmers' Unions Farmers' unions are changing from temporary organizations to permanent ones, and steadily increase in number. In 1921 there were only 681 tenant farmers' unions. It increased to 4,775 unions at the end of June, 1933. The number of landowners' unions correspondingly increased from 192 to 672 in the same span of time. Opposition between the two apparently is much expanded in scope and deepened in nature.

FARMERS' UNIONS

	Landowners		Tenant-farmers		Landowners and tenant farmers	
	Unions	Memberss	Unions	Member	Unions	Members
1929	655	55,138	4,156	315,771	1,986	244,943

1932	662	50,454	4,650	296,839	2,098	258,613
1933	682	49,645	4,810	302,736	2,309	279,431

The Consumers' Co-operative Movement

The consumers' co-operative movement among the working classes is rather unsound since 1931. Many consumers' co-operative societies have been dissolved or amalgamated. The estimated number in 1933 was 90 with a membership of 20,000. Tokyo had the largest number of the societies counting 40. The most important societies are the Yokohama Koshin, membership 1,700 ; the Ishikawajima Jikyo, 1,400 ; the Steel Manufacturing Workers' 600 ; the Tokyo Kyodo Sha, 1,520 ; the Josai, 850 ; the First Godo, 700 ; the Koto, 500. The 90 societies classified according to the size of membership are as follows :

Range of membership	Percentage of the number of societies included
1-50	14.0
51-100	9.0
101-200	35.0
201-300	24.0
301-400	4.0
401-500	1.0
501-600	3.0
601-700	4.0
701-800	1.0
801-900	1.0
901-1,000	0.0
Above 1,001	4.0

Generally one member has one share ranging from 1 to 20 yen. The classification of 31 larger societies according to their capital is as follows :

Digitized by Google

Paid-up capital (In yen)	Number of societies
100-300	0
300-500	4
500- 1,000	8
1,000- 2,000	6
2,000- 3,000	5
3,000- 4,000	2
4,000- 5,000	3
5,000-10,000	2
Above 10,000	2
„ 20,000	2
„ 30,000	1

The average monthly purchase of a member is ¥8.00 with ¥17.48 maximum and ¥1.47 minimum, and the purchasing power is on the decline.

The rate of business expenses against the amount of sale was from 8 to 10% in most of societies, and 10% of the societies exposed deficits, owing to the rising tendency in prices in the year.

Village Societies In addition to these more closely organized societies, there are some village co-operative associations. Since 1926, the need of forming village co-operative societies has come to be recognized by the farmers, and such societies are making rapid progress with the help of the national farmers' unions.

Measures for Assistance of Workers

The Government Aid The most important policy of the Government in this connection in 1931 was the drafting of the Labour Union Law. But by the strong opposition of the representatives of business organizations the essential part of the Bill was deleted. The Labour Dispute Harmonizing Bill met the same fate. But the Government did something for the labourers by enforcing the Child Insurance Law, the Labour Accident Relief Law, and the Labour Accident Legal Insurance Law.

The second one, the Labour Ac-

Digitized by Google

cident Relief Law provides for relief by employers of workers injured in quarrying, etc., in civil engineering work, in transport work, and as longshoremen. Hitherto, these labourers had no protection, being outside the terms of the Mine Law or the Factory Law, except that they occasionally received gifts or consolation money from employers. By the enforcement of this law their compensation becomes for the first time a legal obligation on employers. The number of enterprises which come under the Law was 8,160 and that of employees 321,962 in 1932. The number of cases in 1932 was 31,582 and the money expended amounted to ¥927,037.

Relief in Factories and Mines The condition of reliefs in 1932 in the factories and mines which come under the Factory Law and the Mine Law was as follows :

	Number	Expenses (In yen)
Factory		
Number of factories	75,799	
„ „ operatives	1,783,868	
Cases of relief		
Casualties	21,661	1,144,394
Private factories	8,888	720,543
Government factories	12,773	423,851
Sickness	758	9,891
Private factories	621	6,038
Government factories	137	3,853
Mine		
Number of mines	1,134	
„ „ miners	185,840	
Cases of relief		
Casualties	9,772	1,818,290
Sickness	181	46,893

The Insurances The types of insurance available for labourers and people of small means generally are (1) Health Insurance, (2) Post-Office Life Insurance, (3) Post-Office Annuities and (4) Labour Accident Relief Legal Insurance.

(1) Health Insurance has been in existence since 1926. The system was revised thoroughly in 1920 and showed a good progress. In 1932 the number of labourers who were injured while at work and relieved according to the provisions of the Health Insurance Law was 21,661, and deaths numbered 254, decreasing 886 and 59 respectively as compared with the previous year.

There were 341 Health Insurance Associations with a membership of 615,734 at the end of May, 1933. Besides, the Health Insurance handled by the Government had 1,127,250 men insured who were workers in 49,125 factories and enterprises.

(2) The Post Office Life Insurance policies for adult in force at the end of March, 1934 were as follows :

	March, 1933 (revised)	March, 1934
Number	18,183,187	20,057,686
Premiums	¥ 14,726,032.8	16,251,313.5
Sums insured	¥2,412,798,951.1	2,654,183,347.2

There is no way of finding the exact number of policies contracted by labourers, but judging from the lowest class of sums insured about 17 per cent. of the total may be insurers of the labouring class.

Child Insurance is provided for under the Post-Office Insurance scheme. According to the rules, the age of the child must be from 3 to 12, which means that about 19,000,000 children are eligible. The monthly

Digitized by Google

premium is of three kinds, 30 sen, 50 sen and one yen, while the term of insurance is for 15 years or 20 years. For a monthly premium of one yen the insured amount is ¥60 for children under 4 years, 20 yen is added for every subsequent year, reaching 180 yen at the age of 9. From age 10 to the expiration of the term a total amount of from ¥86 to ¥190 according to the age of the insured at the time of making the original contract. The number of policies in force at the end of March, 1934 was 1,760,029, premiums ¥1,213,149.5 and sums insured ¥237,262,337.

(3) The condition of the Post Office Annuities at the end of March, 1934 was as follows:

	March, 1933	March, 1934
Number of policies	248,197	276,664
Premiums	¥44,334,975.03	55,178,047.03
Amount of annuities paid in the fiscal year	¥18,901,336.06	21,932,757.02

(4) Labour Accident Relief Legal Insurance. The Labour Accident Relief Legal Insurance Law was enforced on April 1, 1932. The purport of the law is to insure harmonious practice of the provisions of the Labour Accident Relief Law, in view of the cases that may arise in which labourers engaged in works under such smaller capitalists as stone-cutters, public-works or building contractors and stevedore masters cannot get allowances specially when large-scale accidents occur. According to the provisions of the law, subscription is compulsory for public-works or building contractors, and the premium is borne by the employers entirely. In 1932-1933 the number of policies taken was 5,148 and the premiums received amounted to ¥1,100,188.43. The number of cases of sickness or casualties was 3,505 and the expenses amounted to ¥143,572.68.

Creation of Landed Farmers The work of creating and maintaining landed farmers by national subsidy was begun in 1926, and it was carried out in all prefectures except Tokyo. During 8 years from 1926 to 1933, the amount of loans reached ¥109,072,100 for new establishments and maintenance. The money comes from the treasury of the Post-Office Insurance.

The area of land possessed by the new landed farmers in 1933 was 25,201 cho (cho=2.45 acres) of rice fields, 22,464 cho of upland-farms and 1,097 cho of other land, making a total of 48,763 cho. The number of new landed farmers in 1933 was 125,232, and that of maintainers 13,046.

Mutual Assistance Organizations The number of associations organized by the new landed-farmers, for the purpose of mutual assistance in payment of loans and improving farming methods, reached 1,116 in 1932 with a total membership of 34,576. The business of these bodies varies according to local conditions, but almost all of them are making efforts to save money and pay back loans received by members or prepare for lean years, and to help members in cultivation, etc. They also organize subsidiary occupations for members, give help in paying taxes, and organize lectures or exhibitions. When there are sick people among members the association helps them with materials or by working on the fields for them so as to maintain the ownership.

Dispute-Harmonizing Law The Government is eager to prevent labour disputes if possible, and especially those involving left wing organizations. If this cannot be done there

Digitized by Google

is no other means to meet the situation than equitable adjustment of disputes after their occurrence. The Labour Dispute Harmonizing Law was first issued in 1926, but experience has since convinced the Government of the need for its revision. The Government sets much store by the services of official mediators or "harmonizers," and in the revised law the power of such officials is to be increased.

In 1933, there was only two cases in which a labour dispute was settled by the effort of a harmonizing committee organized according to the provisions of the Harmonizing Law. The number of cases settled by harmonizing effort outside the Law increased along with the increase in the number of disputes. Figures for 1933 follow:

Number of disputes	1,897
„ „ cases handled by arbitrators of all kinds	602
Harmonizing committee	2
Official arbitrator	152
Police arbitrator	210
Other officials	8
Municipal officials	27
Private arbitrator	203
Settled by arbitration	594
Not settled by „	8

Employment Exchange (See Chapter XXX.)

CHAPTER XXXII

MEDICINE AND SANITATION

General

Foreign Physicians "Where there are three doctors there are two atheists" says the old proverb: yet medicine has ever been the handmaid of religion, and it was through a Christian missionary, St. Francis Xavier, that Western bodily healing first reached the shores of Kyushu. Later, when trade between foreign countries and Japan was the privilege of Dutch merchants only, the physicians who came with them proved a priceless source of knowledge to those Japanese who travelled secretly to Nagasaki in order to learn these new things: and the Bavarian scientist, P. F. von Siebold, spent three years in Yedo instructing the Shogunate doctors in his art. Then, as the Meiji Era opened the gates to foreign learning of every sort, Western medicine entered on the flowing tide, submerging, at least for a time, the native or Chinese system that had obtained for so many centuries, and of which further mention will be found on another page. Europeans were engaged to organize hospitals and to teach medical science in the colleges; and though Germany soon came to dominate the field in the latter case, it was an Englishman, Dr. Willis, who was the first to be officially engaged; he and Dr. Anderson being appointed to the Military and the Naval hospitals respectively in Tokyo.

It was largely through the influence of the late Dr. Baelz, who successfully attended an Imperial patient when the latter was dangerously ill, and of Dr. Scriba, the well-known surgeon, that Japan soon turned to Germany for almost all her medical instruction, though the late Baron Takagi, founder of the Tokyo Charity Medical College and Hospital and formerly head surgeon of the Navy, kept his institution for many years representative of the English school of medicine.

Among Americans might be mentioned Dr. A. E. Vedder, naval surgeon, Dr. Hepburn, and Dr. Eastlake, the father of American dentistry in Japan, though perhaps both were more famous as dictionary-makers; and, more recently, Dr. Teusler of St. Luke's Hospital in Tsukiji.

Physicians, Dentists, Pharmacists, etc.

Medical Practitioners The total number of medical licences issued in 1933 was 3,141 (besides 13 to foreigners), showing an increase compared with the preceding year of 286 licences (the number issued to foreigners increased by 3). In the following table is given the number of persons to whom licences were issued, classified and compared with the preceding year's figures:

	1932	1933
Graduates of universities	1,576	1,649
Completed course in Government or public colleges	97	115
Completed course in designated private colleges	1,180	1,374

Digitized by Google

	1932	1933
Completed course in foreign colleges (including examination)	2	3
Total	2,855	3,141

The total number of medical practitioners at the end of 1932 was 50,068 (besides 23 foreigners), including 1,881 women, showing an increase on the preceding year of 1,963 practitioners (an increase of 7 among foreigners). The following table gives the number of medical practitioners at the end of 1933:

NUMBER OF MEDICAL PRACTITIONERS

	Males	Females	Total	Actually Engaged	Per 10,000 of Population
1929	47,484	1,320	48,804	43,676	6.94
1930	48,239	1,442	49,681	45,582	7.07
1931	46,493	1,612	48,105	44,889	6.87
1932	48,188	1,881	50,069	46,029	6.94
1933	50,578	2,214	52,792	49,844	7.41

Of the above total number in 1933, those who actually engaged in the diagnosis and treatment of patients were 49,844, being 94 per cent. of the total.

The total number of those medical practitioners who were actually engaged in the diagnosis and treatment of patients at the end of 1933 was at the rate of 7.41 practitioners per 10,000 inhabitants, showing an increase of 0.47 when compared with the preceding year.

The ratio of the distribution of medical practitioners between urban and rural districts was 13.24 practitioners per 10,000 of population in the urban districts while it was 4.78 per 10,000 inhabitants for the rural districts. Compared with the preceding year, it was an increase of 1.55 for urban districts and a decrease of 0.01 for rural districts.

Dental Surgeons The total number of licences issued to dental surgeons in 1933 was 1,175, being an increase of 179 when compared with the preceding year. In the following table is given the number of persons to whom the licences were issued in 1933, classified and compared with the preceding year's figures:

	1932	1933
Completed course in dental colleges	923	1,074
Completed course in foreign schools (including those who passed examination)	4	7
Passed examination	69	94
Total	996	1,175

The total number of dental surgeons at the end of 1933 was 17,984 (besides two foreigners), including 1,178 females, showing an increase on the preceding year of 820 (number of foreigners remained stationary). The following table gives the number classified and in percentage (the percentages for the preceding four years are also given for comparison):

Digitized by Google

	At the end of 1933	Percentage 1933	1932	1931	1930	1929
Completed course in dental colleges	9,139	50.82	48.14	44.57	42.02	38.97
Completed course in foreign schools (including examination)	78	0.43	0.43	0.45	0.51	0.53
Passed examination	8,761	48.72	51.40	54.94	57.41	60.45
In practice from the time before the promulgation of the Law of Dental Surgeons	6	0.03	0.03	0.04	0.06	0.05
Total	17,894	100.00	100.00	100.00	100.00	100.00

Of the above number, those who were actually engaged in practice numbered 17,562 which corresponds to 97.65 per cent. of the total number of dental surgeons.

The total number of those dental surgeons who were actually in practice was at the rate of 2.61 per 10,000 of the population.

The ratio of the distribution of dental surgeons in cities and districts of the country was 5.04 for cities and 1.52 for districts per 10,000 inhabitants. Compared with the preceding year, it was an increase of 0.25 for cities and 0.04 for the districts.

At the end of 1933, besides the above mentioned number of dental surgeons, there were 85 medical practitioners who specialized in dentistry.

Pharmacists The total number of pharmacist's licences issued in 1933 was 1,502, showing an increase, when compared with the preceding year, of 105 licences. In the following table is given the number of persons to whom licences were issued in 1933 classified and compared with the preceding year's figures:

	1932	1933
Graduates of universities	28	22
Completed course in colleges	822	296
Completed course in designated private school of pharmacology	952	1,138
Completed course in foreign schools (including examination)	4	2
Passed examination	91	44
Total	1,397	1,502

The total number of pharmacists at the end of 1933 was 21,802 (besides 1 foreigner), including 2,278 females, showing an increase, compared with the preceding year's figures, of 1,332 (the number of foreigners remained stationary); and the following table gives the number classified and in percentage (the percentage for the preceding four years are also given for comparison):

	Number at the end of 1933	Percentage 1933	1932	1931	1930	1929
Graduates from universities	287	1.32	1.21	1.27	1.19	1.19
Completed course in colleges	10,906	50.02	46.57	42.46	39.44	36.42
Completed course in foreign schools (including examination)	30	0.14	0.12	0.13	0.15	0.15
Passed examination (including examination under former regulations)	10,579	48.52	52.10	56.14	59.22	62.24
Total	21,802	100.00	100.00	100.00	100.00	100.00

Digitized by Google

Of these pharmacists, (1) the number of practising pharmacists (those who were engaged in the dispensing of medicines in the pharmacy, those who were engaged in the sale of medicines and those who were engaged in the manufacture of medicines) was 14,847 (2) the number of those who, being employed by hospitals or other dispensaries, were engaged in the dispensing of medicines was 2,371 and (3) those who were exclusively engaged in the sale of patent medicines numbered 1,323. Those coming under (1) corresponds to 68.10 per cent. of the total number of pharmacists while (2) and (3) represented 10.88 and 6.07 per cent. respectively.

At the end of 1933, the proportion of pharmacists to the population was 3.24 per 10,000 inhabitants, showing an increase of 0.15 on the preceding year.

Pharmacies and Traders in Medicines

Pharmacies The number of pharmacies at the end of 1933 was 11,713 of which 11,595 were run by pharmacists and 118 by non-pharmacists, showing an increase, when compared with the preceding year, of 403 pharmacies run by the pharmacist and 28 pharmacies managed by non-pharmacists.

Traders in Medicines The total number of persons engaged in the sale of medicines at the end of 1933 was 28,806, showing an increase of 616 persons on the preceding year; among them, the qualified pharmacists who are engaged in the sale of medicines without opening pharmacies numbered 650 and the druggist 28,156. Of these druggists those who were qualified to deal in designated medicines numbered 4,230, of which those employing pharmacists were 1,760, those coming under the provisions of Art. XXXVII, Item 4 of the "Regulations for the Trade in Medicines and the Handling Thereof" were 131 and those coming under the second clause of the supplementary provisions of the same regulations were 2,339.

Medicine-Manufacturers The total number of medicine-manufacturers at the end of 1933 was 3,832 being an increase of 22 on the preceding year. Of these manufacturers 1,199 were pharmacists, 879 those who employ pharmacists, and 1,754 neither pharmacists nor those employing pharmacists.

Midwives

Number The total number of midwives at the end of 1933 was 56,590 (besides two foreigners), showing an increase of 1,935 (no change in the number of foreigners) on the preceding year; they may be classified into 4,176 persons who completed the course in designated schools or training institutes, 48,563 who passed the examination, and 3,397 who have been in practice from time prior to the operation of the Midwives Regulations, and 454 who practise in limited districts.

Distribution The proportion of midwives to the population was 8.42 per 10,000 of the population, being an increase of 0.18 on the preceding year.

The ratio of the distribution of midwives between urban and rural districts of the country was 11.72 in the urban districts and 6.92 in the rural districts per 10,000 inhabitants, showing, when compared with the ratio in the preceding year, a decrease of 0.08 in the urban districts and an increase of 0.19 in the rural districts.

Nurses, Acupuncturists; Moxicauterists, and Shampooers

Nurses The total number at the end of 1933 of nurses who had

Digitized by Google

obtained licences from the prefectural offices was 96,020 (of which 4,412 were under-nurses) showing an increase of 6,336 on the preceding year.

Male Nurses The number of male nurses at the end of 1933 who had obtained licences from the prefectural offices was 172, showing an increase of 30 on the figures of the preceding year.

Acupuncture, Moxicautery, and Shampooing The following table gives the number of persons engaged in acupuncture, moxicautery, and shampooing who had obtained licenses from the prefectural offices at the end of 1933.

	Not Blind			Blind		
	Males	Females	Total	Males	Females	Total
Acupuncture	2,515	566	3,081	1,730	343	2,073
Moxicautery	3,165	862	4,027	689	172	859
Shampooing	7,675	3,673	11,350	15,272	9,280	24,552
Acupunture and moxicautery	7,272	1,360	8,632	1,440	308	1,748
Acupuncture and shampooing	1,043	259	1,302	2,706	635	3,341
Moxicautery and shampooing	527	119	646	410	80	490
Acupuncture, moxicautery, and shampooing	4,451	660	5,111	4,526	825	5,351
Total	26,648	7,501	34,149	26,771	11,643	38,414

Among the above mentioned shampooers there were 1,928 who were engaged in the treatment of contusion by means of Judo.

The following table gives the ratio to the population of the above mentioned acupuncturists, moxicauterists, and shampooers and the percentage of the blind and those who are not blind among them:

	Per 10,000 inhabitanits	Percentage Not Blind	Blind	Total
Acupuncture	0.77	59.78	40.22	100.00
Moxicautery	0.73	82.42	17.58	100.00
Shampooing	5.34	31.61	68.39	100.00
Acupuncture and moxicautery	1.54	83.16	16.84	100.00
Acupuncture and shampooing	0.69	28.04	71.96	100.00
Moxicautery and shampooing	0.17	56.87	43.13	100.00
Acupuncture, moxicautery, and shampooing	1.55	48.85	51.15	100.00
Total	10.79	47.06	52.94	100.00

Hospitals

Public Hospitals At the end of 1933 there were 87 public general hospitals, the number being same as in the preceding year.

PUBLIC HOSPITALS IN 1933

Capacity of admitting patients	In cities	In towns	In villages	Total
More than 10	2	13	4	19
" 30	5	10	—	15
" 50	12	7	—	19
" 100	31	3	—	34
Total	50	33	4	87

Digitized by Google

In the following table are given the capacity for admitting the patients and the number of patients admitted in 1933 to these hospitals :

Patient admitting capacity	9,029
Of the above capacity :	
For tuberculosis	266
„ infectious diseases	699
Number of patients :	
Remaining from the preceding year	3,439
Admitted this year	81,926
Discharged	75,162
Died in hospital	6,566
At the end of the year	3,637
Aggregate number of in-patients treated each day	1,920,338
Average capacity per hospital	103.78
Average number of in-patients per hospital	981.21
Average number of days a patients stayed in hospital	22.50

Private Hospitals (Charity Hospitals, Tuberculosis Hospitals, Insane Asylums and Leprosaria excluded.) The total number of private hospitals at the end of 1933 was 2,453 (of which 59 had been established by the public juridical persons and 12 by foreigners), which, when compared with the figures for the preceding year, shows an increase of 102 hospitals.

The following table gives the number of these hospitals in urban and rural districts classified according to their capacity of admitting patients:

	Cities	Towns	Villages	Total
With capacity for more than 10	1,082	542	198	1,822
„ „ 30	253	86	29	368
„ „ 50	127	37	21	185
„ „ 100	66	7	5	78
Total	1,528	672	253	2,453

In the following table are given the number of private hospitals classified according to the diseases they treat :

	Cities	Towns	Villages	Total
General	744	525	190	1,459
Medicine	185	48	15	248
Surgery	144	28	11	183
Paediatrics	56	1	1	58
Ophthalmology	82	26	18	126
Obstetrics and gynaecology	175	34	13	222

Others	3	—	—	3
Total	1,528	672	253	2,453

In the following table are given the figures in connection with the capacity of admitting patients and the number of patients, etc. in the private hospitals :

Capacity	69,738
For infectious diseases	3,742
„ tuberculosis	2,252
Number of in-patients	
Remaining from the preceding year	19,311
Admitted in 1933	487,685
Left the hospital	454,973
Died in hospital	29,284
At the end of 1933	22,739
Aggregate number of in-patients treated each day	8,715,087
Average capacity per hospital	28.43
Average number of in-patients per hospital	206.68
Average number of days in hospital of a patient	17.19

Digitized by Google

Charity Hospitals (Tuberculosis Hospitals, Leprosaria and Insane Asylums excluded.) The total number of public and private charity hospitals at the end of 1933 was 35, of which 12 were public and 23 private hospitals, showing a decrease on the preceding year of one private hospital.

The following table gives the capacity and the number of patients who entered them in 1933.

Admitting capacity	3,360

Average number of days apatient stayed in leprosarium	267.59	238.40	302.77

Hospitals for Prostitutes At the end of 1933 there were 133 hospitals for prostitutes, and the total capacity for them was 5,330 (of which 10 were in the infectious diseases rooms). Compared with the preceding year, there was a decrease of three hospitals and 51 in their admitting capacity. The number of patients who had remained over from the preceding year in the hospitals was 1,289 and those who entered them in 1933 numbered 49,934, making a total of 51,223 (of which 769 were clandestine prostitutes admitted under the provisions of Art. III of the Administrative Execution Law).

The following table gives ratios respecting facts connected with the above mentioned hospitals for prostitutes:

	1933
Average capacity per hospital	40.08
Average number of patients admitted per hospital	385.14
Average number of days a patient remained in hospital	18.99
Average number of days a clandestine prostitute remained in hospital	19.09

Infectious Diseases Hospitals (Established under the provision of the Law for the Prevention of Infectious Diseases). The total number of infectious diseases hospitals at the end of 1933 was 1,261, consisting of 116 established by cities, 960 by towns, villages and other similar public corporations and 185 established by town or village associations or other similar associations. The admitting capacity of these hospitals was 26,737, making an average of 21,20 per hospital.

The isolation wards at the end of the same year numbered 7,398, consisting of 56 established by cities, 6,971 by towns, villages or similar public corporations, and 371 by the town or village associations or similar associations; and the admitting capacity in these isolation wards was 67,558, the average per ward coming to 9.13.

The total number of isolation houses at the end of 1933 was 75, of which 12 were those established by cities, 63 by towns, villages or similar public corporations. The es-

Digitized by Google

timated total capacity of these isolation houses was 1,926, the average capacity per house coming to 25.68 persons.

At the end of 1933, there were 44 disinfecting stations.

Medicines

Medicines and Preparations not Mentioned in Pharmacopoeia The total number of persons who have reported in 1933 to the respective prefectural offices of the manufacture, importation and sale of medicines and preparations not to be found in any pharmacopoeia was 705 and the number of medicines reported 2,372 showing, compared with the preceding year an increase of 50 persons and an increase of 250 medicines.

Inspection of Medicines In the tours of inspection made during 1933, 27,661 places (an increase of 4,273 when compared with the preceding year) were visited; and the following table gives the places visited and the results of the inspection:

	Number of places visited	Percentage of places visited against places to be visited	Percentage of deleterious medicines discovered		Percentage of violators of the regulations punished
			places	medicines	
Total	27,661	25.16	22.93	42.89	0.65
Pharmacists (with pharmacy)	5,128	44.30	26.66	48.54	1.11
Pharmacists (others)	91	7.03	10.99	21.98	—
Non-pharmacists	36	30.77	16.67	36.11	—
Druggists	7,129	26.06	7.86	12.96	0.87
Medicine-manufacturers	648	23.56	1.08	2.31	2.01
Hospitals	766	28.19	33.03	59.14	—
Medical practitioners	10,006	23.27	34.83	67.95	0.33
Dental surgeons	3,501	21.21	15.68	23.16	0.26
Veterinary surgeons	356	7.68	29.49	56.74	1.69

Patent Medicines At the end of 1933, the total number of patent medicine traders was 40,845, which shows an increase of 333 when compared with the figures of the preceding year. Of these, there were 10,276 pharmacists, 3,099 medical practitioners and veterinary surgeons, and those who employ pharmacists numbered 2,488, those who come under Art. XXIV of the Patent Medicine Regulations were 18,700, and those who come under Art. XXV, of the same law 6,243, while there were 39 who were engaged exclusively in the importation and sale of patent medicines.

The total number of recognized patent medicines was 283,475 (of which 175 were imported), showing an increase of 14,849 when compared with the figures of the preceding year.

Patent medicines manufactured or imported in 1933 amounted to ¥81,627,188 (of which ¥546,590 represents the import from the territories), showing when compared with the population in that year the ratio of 1.21 yen per person, being a decrease of 1 sen compared with the preceding year.

Japanese and Chinese Medicine

In Japan, as in the West, there is a system of home treatment, the history of which can be traced back into ancient times. Needless to say, however, that by far the greater part of home treatment in those days sprang from superstition. The people in those days had no knowledge

Digitized by Google

of medicine, but it would be an error to say that all the methods employed in home treatment were nonsense. Such methods as are really efficacious and can stand the test of modern science have come to survive to this day and these cannot be cast aside as mere superstition. In this connection it may be remembered that digitalis, cocaine, and other remedies and drugs have all originated in some simple home medicine of uncivilized peoples.

There are naturally many methods of home treatment in Japan, some of which can hold their own against the tests of modern science, while others cannot.

(1) The latter group of treatments is based upon superstition or erroneous conceptions of medicine and as such it cannot stand the test of modern medical science. Belonging to this group are such so-called methods of cure as incantation, prayer, conjuration, etc. Yet it must be said that sometimes people are cured from their diseases in consequence of auto-suggestion, and in such cases the cure can hardly be said to have been brought about by superstition.

(2) Rational home treatment can be classified into physical and pharmaceutical treatment. The former includes hydrotherapy, balneotherapy, sand-bathing, massage, acupuncture, moxibustion, etc. and since other remedies are already recognized as physical therapy by present medical science and need no special explanation, it is only necessary to review here, in brief, acupuncture and moxibustion.

Acupuncture Acupuncture, as a method of treatment or preventive of disease, consists in the introduction of a gold, a silver, or a steel needle into the living tissues and moving it very little vertically or, in some cases, leaving it in the tissue for from 2 to 3 minutes. Little is known of the early history of acupuncture in Japan, but this much is known, that the art was introduced to this country from China in the reign of the Emperor Kimmei (about 550 A. D.). After reaching Japan great improvements were made in technique as well as in the needle itself and the practice of it spread widely year after year. However, with the introduction of Western medical science after the Meiji Restoration, acupuncturation gradually dwindled in favour, but in recent years it has somewhat regained.

The needle now in use is from 3 to 10 cm. in length and about 0.2 mm. in thickness. There are certain specified points in the human body, some three or four hundred, where the needle can be inserted and it has been found that these points agree, in general, with Head's zones.

If the operator is skilful in introducing a needle into the tissues, no pain will be felt by the recipient. Only a little shock as though caused by electricity will be felt and hardly any bleeding will take place. As regards the action of the needle upon the human body its stimulative function must first be mentioned. As the needle stimulates the nerves, it serves to invigorate their function directly or reflectively and dilates the blood vessel, thus bettering the nourishment of that part of the body to which the treatment is applied and arousing a weakened function into greater activity. In the second place its sedative function has to be mentioned, and sedative results are achieved according to the length of time the needle is allowed to remain in the tissue. Its third function is that of inducing blood from other parts of the body to the part where the treatment is given, thus serving to relieve any congestion of blood.

Acupuncture is thus a good reme-

Digitized by Google

dy for functional diseases of the nervous system as paresthesia, motor paralysis, anchylosis, and several forms of neuralgia. It cannot be applied in cases of high fever, wasting disease, hæmorrhagic diathesis or any acute infectious disease. Among the places where the application must not take place may be mentioned wounds, gangrenous growths, the heart, the lungs, blood vessels and the pregnant uterus.

Moxibustion This method was brought, with acupuncture, from China in the reign of the Emperor Kimmei, and it came into general use after gradual improvement in its methods.

The moxibustion method of this country, with the moxa, was introduced to Western countries by Rhiene (1673), Buschaf (1674), both of the Netherlands, Jan Craset (1689) of France and Kampfer (1690) of Germany. After the beginning of Meiji, moxibustion, like acupuncture, gradually ceased to be practised, but of late it is again growing in popularity. In moxibustion, as in acupuncture, there are specific points of the body on which lighted moxa may be placed, thus producing erythema or blisters on the skin. Moxa is made from the leaves of mugwort which, after being dried in the sun, are rubbed and softened like cotton. They are then rolled into balls the size of a red bean or a soya bean and placed upon the skin. Cases where moxibustion cannot be used are almost the same as in acupuncture. Due allowance in the size of the moxa balls and the frequency of their use must be made for an infant or a weakened body. The diseases for which moxibustion is effective are :

(1) Nervous diseases : — neuralgia, cramp, neurasthenia, hysteria, chorea, and certain kinds of cerebrospinal diseases.

(2) Motor nervous diseases : — myalgia, articular rheumatism, myositis, arthritis.

(3) Digestive disorders : —atonia of the stomach and bowels, Ectasia of the stomach, gastric and intestinal catarrh, stomach paroxysm, dyspepsia, constipation, and diseases of the liver.

(4) Urinary diseases:—nephritis, pyelitis, cystitis, ureteritis.

(5) Gynecological diseases :—endometritis, metritis, Ovaritis, salpingitis, anomaly of situation and functional disorders.

(6) Pediatric diseases :—dyspepsia, catarrh of the stomach and bowels.

Moxibustion causes leucocytosis, gives an impetus to the recovery of the exhaustion curve line, increases blood sugar, complement and saponin. When used constantly, it creates erythrocytes and hæmoglobin. The nature of moxibustion, according to the studies of authorities, is not only that of heat stimulation, but also that of a protein-therapy.

Home Medicines Prince Sukunahikona is generally regarded as the founder of the indigenous medical science and pharmacy of this country. Communication with China naturally served to bring into this country Chinese medicine and pharmacy, which enjoyed great vogue, so much so that towards the end of the Tokugawa Shogunate Japanese medicine, to use an apparent contradiction of terms, was almost entirely Chinese. When, however, Western medical science was introduced immediately after the Meiji Restoration, people soon abandoned the Chinese school, and not only was Chinese medicine driven out of this country, but most of the Japanese people gave up using home remedies, though in recent years, there has been a return to them. Medical science has made great progress, but

Digitized by Google

the methods of cure have not advanced hand in hand with this progress. Diseases which were incurable in the past still remain incurable and people have again begun to think of home remedies. At the same time we cannot overlook the fact that new Western medicines, which are dispensed on purely scientific lines, are always better than drugs, though these, to some extent, are incorporated in the new medicines. In some cases, however, natural drugs are better than chemically prepared ones, and some physicians, who formerly considered drugs rather lightly, are now prescribing them more freely. In Japan, there are hundreds of drugs, but as space does not permit writing in full, a brief mention will be made of a few which may be of interest to the Western world and which have scientific value.

Home medicines are usually classified into animal, vegetable, or mineral matter, as below.

ANIMAL MATTER:

(1) The sea-ear. The shell, when powdered, is used for eye trouble.

(2) The oyster. The shell is used as an antacida and stomachica; and its fleshy part is utilised as a roborantia and a nutrientia.

(3) The blister beetle. Cantalidin contained in the insect is an efficacious ingredient and is good for the relief of arthritic rheumatism or an abscess, and sometimes is used to give impetus to suppuration. In China, it is said, the insect was used for poisoning purposes.

(4) Honey. Used as a cough remedy and as a laxative.

(5) The lamprey. Used for hemeralopia. Recently it was found that it contains plenty of vitamin A.

(6) The toad. Used as a cardiaca and its efficacious ingredient is gamain or Bufotoxin, and its work is similar to digitalis.

VEGETABLE MATTER:

(1) The tangle. This, as it contains iodine in its composition, is used as an alterantia of syphilis and consumption or scrofulousness.

(2) Rhea-grass. Used for diarrhœa as perspiratory diuretica, narcotic expectorantia or astringentia; and it is well known that the efficacious ingredient "ephedolin," was abstracted from it by Dr. Nagai.

(3) The lily of the valley. Contains convallarin and is used for heart trouble.

(4) The rocambole. This is good for stopping a cough and helping expectoration, besides which it has a sterilizing power in the bowels. It is also prescribed for pulmonary tuberculosis.

(5) Saffron. Polycroid and crotin are efficacious ingredients and the vegetable is good for disorders of menstruation.

(6) Ginger. This is a sudorific and expectorantia, and is sometimes used for dyspepsia. The efficacious ingredient is gingerol.

(7) The purple willow. This, as it contains a chemical compound of salicylic acid, is used for skin diseases, rheumatism or fever.

(8) The geranium nepalenses. This is used widely in Japan, and is good for diarrhœa and intestinal catarrh. The efficacious ingredients have not yet been found.

(9) Ginseng. Is the best-known of Japanese home medicines. It contains volatile oil and saponin. It is used as a tonic in consumption, neurasthenia, impotence, decrepitude, anæmia.

(10) The plum. This is good for dyspepsia and diarrhœa as a pepastic.

(11) The plantain. This is used as a diuretic and expectorant. It is also good for whooping-cough. Plantagion is the efficacious ingredient.

(12) Arrowroot. After being dried in the sun, the root is used for fevers or headaches. It contains plenty of starch.

MINERAL MATTER:

(1) Calcite. This is a peptic and is good for pulmonary tuberculosis. It contains calcium carbonate and magnesium.

(2) "Fukuryukan." This is made from the burnt clay of old clay cooking-stoves and is good for morning-sickness, sea-sickness and intoxication. It contains vitrioline, calcium and magnesium, but it is still uncertain what ingredient is good for disease.

Health Preservation Work

Control of Foods, Beverages, etc. Foods, beverages, and other articles actually under control of the Home Department in accordance with the provisions of the Department Ordinances based on Law No. 15, 1900, are milk and milk-products, non-alcoholic drinks, snow and ice, artificial saccharine matters, food and beverage preservatives, injurious

Digitized by Google

pigments, utensils for foods and beverages, and methyl alcohol, etc. The business of producing and manufacturing these things is making healthy development under the guidance of the authorities concerned, as is shown by the following figures :

PRODUCTION OF MILK DRINKS, ETC.

(In litres)

	1929	1930	1931	1932	1933
Cow's milk	104,529,047	109,035,601	110,364,398	116,475,168	123,686,138

Waterworks and Sewerage

Waterworks During the year from April, 1933 to March, 1934, sanction was given for the construction of waterforks in 20 cities and municipalities.

Those places which obtained permission to construct waterworks may be classified as follows:

Undertaken by	Number of waterworks for which sanction or permission of the construction was given	Number of waterworks which now supply water
Cities	101	97
Towns and villages	326	300
Towns' or villages' associations	5	5
Prefectures	4	3
Private parties	101	92
Total	537	497

Sewerage During the year from April, 1933 to March, 1934, permission to construct sewers was given to four places, namely, Gifu city in Gifu prefecture, Koya town in Wakayama prefecture, Yawata city in Fukuoka prefecture and Miyazaki city in Miyazaki prefecture.

The places which obtained permission to construct sewers are 25 municipalities which completed construction and 18 municipalities under construction.

Removal of Foul Matter The following table gives a general idea of foul matter conducted in 1933 in 122 cities.

Number of houses within the districts in which removal of foul matter was carried out		3,946,909
Removal from the above mentioned houses	Refuse	2,775,872,133 kg.
	Dirt	691,875,513 ,,
	Night-soil	638,186 kl.
Average amount removed per house	Refuse	703.3 kg.
	Dirt	177.4 ,,
	Night-soil	1.3 kl.
Number of houses from which the holders of the land removed foul matters under Art. XXI of Regulation for Enforcement of the Law		77,903
Number of incineration plants		113
Water-closets with purifying equipments		11,423

Note: 1 The figures of the night-soil given in the table represent only those for which city authorities are held responsible for its removal.
2 Number of incineration plants does not include the provisions for burning in the open.

Slaughter-houses and Slaughtering

Slaughter-houses The total number of slaughter-houses at the end of 1933 was 677, of which 85 was established by cities, 343 by towns and villages, 38 by live-stock raisers' or industrial associations, and 211 by private individuals. When compared with the figures of the preceding year, it shows an increase of 9 in city slaughter-houses, 5 in those of live-stock raisers' or industrial associations, and 17 in those privately established.

Slaughtering The number of animals of various kinds slaughtered in 1933 for food purposes and its comparison with the figures for the preceding year are given below (those slaughtered in emergencies or for household use are not included):

Digitized by Google

Kind of animals	Number of cattle slaughtered in 1933	Compared with 1932
Cattle	319,198 head	2,825 (decrease)
Calves	31,164 ,,	1,528 (increase)
Sheep	1,554 ,,	346 (,,)
Goats	2,869 ,,	8 (,,)
Pigs	969,557 ,,	668 (,,)
Horses	93,242 ,,	12,947 (,,)

The following table gives the weight of meat yielded in 1933 by the slaughtered animals and a comparison of the yield with that of the preceding year:

	Total weight		Average weight per head	
	1932 kg.	Compared with 1931 kg.	1932 kg.	Compared with 1931 kg.
Cattle	58,232,989	240,448 (decr.)	182.44	0.86 (incr.)
Calves	1,497,407	45,987 (incr.)	48.05	0.93 (decr.)
Sheep	29,469	3,134 (,,)	19.09	2.89 (,,)
Goats	28,678	513 (,,)	10.00	0.16 (incr.)
Pigs	47,240,401	86,021 (decr.)	48.72	0.13 (decr.)
Horses	13,026,146	1,887,878 (incr.)	139.70	0.98 (incr.)

The following table gives the number of cases in 1933 in which, after examination of animals for slaughter, slaughter was prohibited or orders were given for destruction after slaughter of the whole or parts of the carcasses or of the viscera only.

	Number prohibited	After slaughter: Wholly destroyed	After slaughter: partly destroyed	After slaughter: Viscera only destroyed
Cattle	74	147	4,314	81,695
Calves	9	22	210	1,244
Sheep	—	1	2	576
Goats	—	—	—	18
Pigs	239	194	4,076	363,275
Horses	211	68	3,157	12,198

Inspection of Imported Meat In 1933, the inspection of imported meat was carried out in the 9 ports of Osaka, Yokohama, Kobé, Shimonoseki, Moji, Ujina, Nagasaki, Izuhara and Tsuruga.

The total amount of meat inspected at these ports was 10,316,815 kilogrammes, showing a decrease of 446,046 kilogrammes on the preceding year. Classified by the kinds of meat, it was as follows:

	Weight of meat inspected (in kg.)
Fresh beef	158,332
Chilled beef	7,060,148
Frozen beef	2,959,884
Mutton	32,504
Pork	105,947

Insane Persons

At the end of 1933, the total number of insane persons was 76,039 which shows an increase of 2,499 on the figures for the preceding year. Its ratio to the population of the country in that year was 11.31 per 10,000 of population, which compared with the preceding year, shows an increase of 0.22.

The following table gives the number of insane persons at the end of 1933 classified according to the places of their custody or confinement:

Digitized by Google

	Actual numbers			Percentage		
	Males	Females	Total	Males	Females	Total
Admitted into insane asylums under the law concerning Asylums for the Insane	1,156	649	1,805	2.38	2.37	2.37
Admitted into substitute asylums under the same Law	1,590	1,081	2,608	3.27	3.71	3.43
Under custody in other asylums or hospitals	2,816	1,542	4,357	5.79	5.62	5.73
Under custody in other places	5,463	1,193	6,656	11.24	4.35	8.76
Under temporary custody	75	19	94	0.15	0.07	0.12
Not requiring admission or custody	34,505	23,014	60,519	77.17	83.88	79.59
Total	48,604	27,435	76,093	100.00	100.00	100.00

Poisoning

The total number of persons poisoned in 1933 was 14,071 (an increase of 2,893 on the preceding year), of which 8,086 (57.47 per cent.) were poisoned intentionally, 5,947 (42.26 per cent.) by accident, and 38 (0.27 per cent.) through other's injuries; and of these persons poisoned 3,324 died, of which 2,912 were those poisoned intentionary, 394 those poisoned by accident, and 18 those poisoned by others, so that 36.07 per cent. of those intentionally poisoned died, 6.63 per cent. of those accidentally poisoned also died, and 47.37 per cent. of those poisoned through other's injuries also succumbed. Of poisonous substances the most frequently used in intentional poisoning and poisoning through other's injuries are chemicals, especiality a preparation containing phosphorus; accidental poisoning is mostly due to eating poisonous animals or plants or putrid food.

Burials and Cremations

The total number of burial-grounds at the end of 1933 was 977,418 and their total area was 22,560 hectares, making the average area of burial-ground 0.02 hectare; and the total number of crematoria at the end of the same year was 34,728 in which 639,261 bodies were cremated during the year, so that a crematorium burnt on an average 18.4 bodies. In the same year 645,535 bodies were buried uncremated, so that those cremated came to 49.8 per cent. and those buried uncremated to 50.2 per cent. of the total number of burials, which, when compared with the percentage for 1932, showed an increase of 1.5 per cent. in those cremated.

Prevention of Infectious Diseases

Cholera In 1933, there was no cases of cholera.

Dysentery, including Ekiri The total number of cases of dysentery in 1933 was 38,049 and there were 14,220 deaths therefrom which when compared with the figures for the preceding year, show an increase of 5,798 cases and 1,355 deaths. The ratios of these cases and deaths to the population in the same year were 5.66 cases and 2.11 deaths per 10,000 inhabitants, showing, compared with the preceding year, an increase of 0.80 cases and 0.17 deaths.

The total number of cases of dysentery which broke out in urban districts only during the year under review was 25,065 which corresponds to 65.88 per cent. of the total number of dysentery cases throughout the country. Of these, there were 8,414 deaths. The rate of cases and deaths per 10,000 of urban population was 11.98 and 4.02 respectively, showing, when compared with the preceding year, an increase of 4.23 cases and 1.31 deaths.

Typhoid Fever The total number of

Digitized by Google

cases of typhoid fever in 1933 was 38,529 cases and deaths therefrom 7,232, showing an increase of 3,010 cases and 731 deaths when compared with the preceding year. The ratios of these cases and deaths to the population in the same year were 5.73 cases and 1.08 deaths per 10,000 inhabitants showing, when compared with the preceding year, an increase of 0.37 cases and 1.10 deaths.

The total number of cases of typhoid reported for urban districts only during the year was 17,647 which corresponds to 45.80 per cent. of the total number of cases for the whole country. Of the above number, there were 3,585 deaths.

The ratios of these cases and deaths per 10,000 of urban population was 8.44 and 1.71 respectively, showing, when compared with the preceding year, an increase of 1.02 cases and 0.29 deaths.

Paratyphoid Fever The total number of cases of paratyphoid fever in 1933 was 5,305, of which 358 ended fatally, showing, when compared with the preceding year's figures, an increase of 483 cases and a decrease of 38 deaths.

The ratio of these cases and deaths to the population in the same year were 0.79 cases and 0.05 deaths per 10,000 inhabitants, showing, when compared with the preceding year, an increase of 0.06 cases and a decrease of 0.01 deaths.

The total number of cases of paratyphoid fever reported for urban districts only in 1933 was 2,090 which corresponds to 39.40 per cent. of the total number of cases for the whole country, and the deaths therefrom numbered 174.

The ratio of cases and deaths per 10,000 of urban population was 1.00 and 0.08 respectively, showing, when compared with the preceding year, a decrease of 0.14 case and an increase of 0.01 death.

Smallpox In 1933 smallpox broke out in Tokyo and other 27 prefectures, the total number of cases being 375 with 56 deaths. The ratios of these cases and deaths to the population in the same year were 0.06 case and 0.01 death per 10,000 inhabitants. The largest number of cases occurred in Kagoshima prefecture, it being 112 cases with 14 deaths; in the other prefectures the number of cases was all less than 36. (In 1932 there occurred 305 cases with 45 deaths). The total number of cases of smallpox in urban districts was 135 (16 deaths), corresponding to 36.00 per cent. of the total number of cases for the whole country, and the ratio to 10,000 of urban population shows 0.06 case and 0.01 death.

Typhus In 1933 four cases of typhus broke out, one in Osaka prefecture (in urban district) and three in Hyogo prefecture of which two occurred in urban district (with 1 death) and one in rural district. (There were 3 cases in 1932 with 2 deaths).

Scarlet Fever The total number of cases of scarlet fever in 1933 was 12,631 with 408 deaths, showing, when compared with the preceding year's figures, an increase of 4,374 cases and 73 deaths.

The ratio of these cases and deaths to the population in the same year were 1.88 cases and 0.06 deaths per 10,000 inhabitants. Compared with the preceding year, there was an increase of 0.63 in the ratio of cases while the death-rate increased by 0.01.

The number of scarlet fever cases which broke out in cities throughout the country in 1933 was 10,363, representing 82.04 per cent. of the total number of cases in the whole country. Of these there were 302 deaths. The proportion of these cases and deaths per 10,000 of urban population was 4.95 and 0.14 respectively,

Digitized by Google

showing, when compared with the preceding year, an increase of 2.17 cases and 0.04 deaths.

Diphtheria The total number of cases of diphtheria in 1933 was 28,545 with 5,274 deaths, showing, when compared with the preceding year's figures, an increase of 6,679 cases and 916 deaths.

The proportion of these cases and deaths to the population in the same year was 4.25 cases and 0.78 deaths per 10,000 inhabitants, showing, when compared with the preceding year, an increase of 0.95 case and 0.12 death.

The number of cases of diphtheria which broke out in cities throughout the country in 1933 was 14,118 which represents 49.46 per cent. of the total number for the whole country. Of these, there were 2,416 deaths and the ratio of these cases and deaths per 10,000 of urban population was 6.75 and 1.16 respectively, showing, when compared with the preceding year, an increase of 2.62 cases and 0.46 death.

Epidemic Cerebrospinal Meningitis The total number of cases of epidemic cerebrospinal meningitis in 1933 was 359, of which 221 ended fatally, showing, when compared with the preceding year's figures, an increase of 121 cases and 59 deaths. The proportion of these cases and deaths to the population in the same year was 0.05 case and 0.03 death per 10,000 inhabitants, showing an increase of 0.01 both in the ratio of cases and deaths on the preceding year.

The number of cases of epidemic cerebrospinal meningitis in cities throughout the country in 1933 was 219, which represents 61.00 per cent. of the total number of cases in the whole country. Of these cases, there were 142 deaths, and the proportion of these cases and deaths to the urban population in the country was 0.10 case and 0.07 death per 10,000 inhabitants, showing, when compared with the preceding year, an increase of 0.03 cases and 0.02 deaths.

Plague No cases of plague occurred in 1933.

The following table gives the condition of cholera and four other infectious diseases in the country during the fifty years since 1884:

FIFTY YEARS OF INFECTIOUS DISEASES

	Cholera		Dysentery		Typhoid fever	
	Cases per 10,000 inhabitants	Deaths per 1,000 deaths from all causes	Cases per 10,000 inhabitants	Deaths per 1,000 deaths from all causes	Cases per 10,000 inhabitants	Deaths per 1,000 deaths from all causes
1884	0.24	0.67	6.01	9.68	5.56	9.57

Expenses The amount of infectious diseases prevention expenses defrayed out of the National Treasury in the fiscal year 1933 (from April, 1933 to March, 1934) was ¥1,396,983.

In addition to the above, the amount of grants-in-aid from the National Treasury for infectious diseases prevention expenses incurred by Hokkaido and the prefectures (in the cases of sanatoria for tuberculosis, by cities) was ¥1,568,064.

Tuberculosis

The following table shows the results of health examinations conducted in 1933 by the prefectural governments.

	1933	Compared with the preceding year
Estimated number of persons requiring health examination	1,835,992	47,516 (decr.)
Number of persons examined	1,526,142	84,000 (incr.)
Number of persons diagnosed as tuberculous	403	87 (decr.)
Ratio of the tuberculous per 1,000 of the examined	0.26	0.05 („)
Number of persons ordered to suspend from work	64	33 („)

Trachoma

The following table shows the result of examinations conducted by the prefectural governments during 1933.

Digitized by Google

	1933	Compared with the preceding year
Number of persons examined	5,901,344	127,895 (decr.)
Number of trachoma patients		
Severe cases	42,392	1,327 („)
Mild cases	444,550	6,487 („)
Suspected cases	122,894	8,047 („)
Total	609,836	15,861 („)
Ratio of patients per 100 persons examined	8.85	0.40 („)
Number of patients ordered to suspend from their work	202	42 (incr.)

Vaccination

The total number of the 1st period vaccination performed in 1933 was 2,082,671 of which 1,932,762 proved positive and 87,269 negative while 62,640 were not examined of the result of vaccination. Compared with the figures of the preceding year, there was an increase of 33,107 in the total number of vaccination, and of 24,895 in the number of positive vaccination and 10,935 of negative vaccination and 2,723 cases where results not yet examined.

The total number of the 2nd period vaccination was 1,898,386 of which 1,104,957 proved positive, 761,457 negative and 31,972 yet unexamined, showing, compared with the figures of the preceding year, a decrease of 21,548 in the total number vaccinated and 61,240 in positive takes, an increase of 42,221 negatives and a decrease of 2,521 unexamined cases.

The following table gives the percentages of successful vaccinations (the percentages for the preceding four years are also given for comparison.)

			1933 %	1932 %	1931 %	1930 %	1929 %
First period	Public vaccinations	First time	96.46	96.94	96.90	96.78	96.88
		Second time	77.62	79.40	77.67	78.80	79.54
	Private vaccinations	First time	98.00	97.79	98.22	97.68	98.08
		Second time	71.22	78.70	88.24	72.88	68.15
Second period	Public vaccinations	First time	67.16	70.07	66.92	62.87	63.80
		Second time	23.55	25.84	23.60	21.61	23.60
	Private vaccinations	First time	76.59	59.31	56.10	49.86	58.99
		Second time	30.43	36.07	26.95	23.58	30.98

Special vaccinations were carried out in 1933 in Tokyo and other 28 prefectures, and the number of persons vaccinated at these vaccinations was 3,458,489.

Port Quarantine

The total number of vessels inspected in 1933 by harbour offices and temporary port quarantine stations was 19,339 Japanese vessels (with a total tonnage of 66,008,065) and 3,273 foreign vessels (with a total tonnage of 25,989,104), making a total of 22,612 vessels (with a total tonnage of 91,997,169). The total number of persons inspected was 2,288,840 of which ship's crew numbered 1,314,487 and passengers 974,353. Compared with the corresponding figures of the preceding year, the number of vessels increased by 1,147 and that of crew and passengers by 119,761. By these inspections were found 2 persons suffering from smallpox, 5 from scarlet-fever and 21 from other notifiable infectious diseases, making a total of 28 cases. (There was no death from these diseases during the year.) Compared with the preceding year, this shows a decrease of 10 patients.

Of the above mentioned vessels inspected, 10 vessels and 234 per-

Digitized by Google

sons thereon were subjected to disinfection. When compared with the preceding year, there was a decrease of 459 vessels and 1,579 persons. The vessels subjected to detention numbered 6, being a decrease of 29 when compared with the preceding year. The destruction of rats and insects was carried out on 1,258 vessels and 5,318 rats were caught, which, compared with the preceding year, shows an increase of 91 in the number of vessels and a decrease of 348 in that of rats.

Health Examination of Prostitutes

The prostitute quarters actually existing at the end of 1933 (the term prostitute quarters does not here and hereinafter necessarily mean segregated quarters, but is also intended for convenience's sake to include all places where licensed prostitutes have been permitted to carry on their trade) numbered 476, being a decrease of 16 on the preceding year. The daily average during the year of licensed prostitutes in these quarters was 48,687, showing a decrease of 1,138 on the preceding year.

The number of health-examination offices for these prostitutes was 430, and the total number of cases examined in these offices was 2,910,837, and in 57,214 cases the prostitutes were found diseased. The ratio of cases of disease to the total number examined was 1.97 per cent. or 0.09 per cent. lower than in the preceding year. The number of hospitals (including places for treatment lacking hospital accommodations) for admitting these diseased prostitutes was 170, and the average number of times a prostitute was admitted into hospital during the year was 1.18 or 0.07 less than in the preceding year.

The following table gives the number, classified according to disease, of prostitutes in the whole country who were during the year found to be diseased upon examination. When two or more diseases are found in the same person, the one which appears first in the table is taken to be the principal disease; thus for instance, if a person is suffering from both syphilis and gonorrhoea, she is taken to be infected with the former disease and the latter is added to the number in brackets under gonorrhoea (the percentage for the preceding four years are also given for comparison).

	Number of cases in 1933	Ratio in percentage to the total number of cases of disease				
		1933	1932	1931	1930	1929
Syphilis	3,957	6.92	7.02	6.46	5.65	6.26
Gonorrhoea	26,482 (998)	48.03	49.99	52.44	53.57	50.30
Chancroid	15,847 (1,796)	30.84	30.08	27.04	26.97	28.89
Ulceration	3,694 (688)	7.66	7.14	8.21	7.49	7.38
Infectious skin-diseases	223 (59)	0.49	0.41	0.53	0.45	0.47
Tuberculosis	9 (4)	0.02	0.04	0.05	0.01	0.02
Leprosy	— (—)	—	—	—	—	—
Trachoma	1,245 (32)	2.23	2.96	4.40	3.36	3.17
Other diseases	5,755 (299)	10.58	10.98	10.10	11.75	10.21
Total	57,214					

Note: In the percentage of cases of diseases, the diseases which are found in one and the same person are taken as separate cases, so that their total exceeds 100.

Rabies

There was no case of rabies in men in 1933. (In 1931, there was one case).

The number of rabid animals reported in 1933 was 22, showing a decrease of 41 on the figures for the preceding year.

The number of persons bitten by

Digitized by Google

rabid dogs in 1933 was 20 showing a decrease of 92 on the preceding year.

The number of persons who had preventive injection for rabies in 1933 was 3,030, showing an increase of 175 on the preceding year. Of the above number, 20 were those who had been bitten by rabid dogs, and 3,010 by animals suspected of rabies.

Bacteriological Laboratories

The number of bacteriological laboratories at the end of 1933 was 202 consisting of 142 which were established by prefectural governments, 19 by cities, 1 by towns or villages and 40 by private individuals, showing a decrease of 2 in the total number on the figures of the preceding year.

The number of bacteriological examinations made in 1933 were 3,428,637 of which those connected with the notifiable infectious diseases were 3,137,323 and those not connected therewith 291,314, showing a decrease of 234,189 in the total number of examinations on the figures of the preceding year.

(On vital statistics of the Japanese see Chapter II.)

CHAPTER XXXIII

PROGRESS OF SCIENCE

Geophysics

Volcanic Activities in Japan during the Period between June, 1931 and June, 1934

By Hidezo Tanakadate

Tisima Zone

(a) Alaid Island

Alaid island, a conical volcano with an altitude of 2,339 m. a. s. l., is the northernmost of the Kuriles, and lies westward of the Lopatka cape of Kamchatka, as well as the islands of Syumusir and Paramusir of the Kuriles. A new volcano islet appeared close to this island.

1933. October 20—November 10, numerous earthquakes were felt at Murakami Bay in Paramusir Island, 28 km. S-E from Alaid.

On November 13, enormous smoke cloud was seen from the same bay.

1934. On January 26, when the S. S. Hakuhō-Maru, a watch boat of the Fishery Department of the Government, was passing near the island, a new volcanic islet came in sight among the eruptive scene, where the sea was more than 20 m. deep before the eruption. It was circular in shape, measuring about 200 m. in diameter and 50 m. in height, and was crowned with a large horse-shoe shaped crater. The exact site of this new islet is 155° 40′ 10″ E and 50° 50′ 30″ N, about 900 m. off the place called Itinowatasi in the east coast of Alaid island. The outbursts were intermittent at that time, emitting smoke clouds with scories in every one to two hours.

In the beginning of March, the following was reported by a naval boat "Otomari," which returned from a two weeks' cruise around the northern extremity of the Kuriles: When the boat passed close to the new islet at a distance of one sea-mile, they saw the island considerably enlarged in size and height as compared with that when it had been discovered by the Hakuhō-Maru. The volcano was circular with a diameter of 400 m. and a height about 90 m.

General aspect of the islet was dark in colour, possibly it is composed of scorious sand. The outburst was paroxymal, each time dark smoke columns rose to a height of 1.0 km. or more.

The prefectural authority of Hokkaidō named this volcano islet "Taketomi-Zima", after the name of Mr. E. Taketomi, Captain of the S. S. Hakuhō-Maru.

(b) Harumukotan (Kharimkotan) Island in the Kuriles

This volcano island lies near Paramusir island in northern Kuriles and is situated at about 154° 30′ E, 49° 6′ N. The area of the island is about 73.55 sq. km. with a length of 13 km. in NW-SE direction, and at breadth of about 8.4 km. The volcano is crowned with a large caldera in which a central cone called Harumukotan (1,213 m. a. s. l.) stands.

1931. September 3—October 8. When a watch boat of the Fishery

Digitized by Google

Department of the Government first visited the island on September 3rd, no unusual scene could be seen there. At the time of its second visit on October 8th, however, the north-western half of the island was covered with volcanic ash. In the western coast where land-slide had occurred several times, the ash was thickest. It is probable that the volcano made an explosion in the month of September.

1933. On January 8, 4.00 a. m., an outburst took place with a huge column of dark smoke, and thereby the upper half of a volcanic hill standing at the south-eastern side of the island, was blown. The lava blocks fell abundantly on the northern part of the island, where the warehouse of the fox-farm station stands. Soon after the explosion, a tremendous tidal wave occurred along the coast of the island and thereby ice floes were carried ashore. It is said that the tidal wave attained a height of about 9 metres above sea level. In the islands of Onnekotan and Paramusir earthquakes were felt three times, tidal waves having been accompanied by each shock.

Nasu Zone

(c) Tarumai

This is the most active volcano in North Japan, but it has not shown any remarkable outburst during the past five years up to the end of 1933.

1933. On December 1, 6.24 p. m., a violent explosion took place after loud roarings which lasted about five minutes. A huge column of dark smoke rose directly above the volcano at first, then it inclined toward WNW at an altitude of 1 km. Volcanic ash rained in an elliptic area, 10 km. in extent in the north-westward direction. By this explosion the main fissure running across the dome from W to E seems to have been extended, so that the volcano became more active than before, sending enormous quantity of smoke. A new fissure appeared on the atrio surface at the eastern foot of the dome; it is a continuation of the main fissure and runs toward ENE for a distance of about 250 m. It was 7 metres wide utmost, and had a branch about 30 metres long. The fissure was active in several parts therefrom sending sulphurous gas.

The position and the course of the fissures did not much differ from those occurred in the case of the explosive eruption of 1917.

On December 5, $4^h\ 35^m\ 19^s$ a. m., a strong earthquake was registered on the seismogram of the Muroran meteorological observatory, about 65 km. SW from the volcano.

On December 6, early in the morning, two earthquakes of volcanic character were felt in Mōrap, NE foot of the volcano.

On December 11, 2.0 p. m., a big explosion with a smoke cloud.

On December 14, 10.0 a. m., after an explosion smoke column of 400 m. high stood above the crater and at 3.0 p. m., it attained a maximum height of 700 m.

The materials, including detritus, lapilli, ash, etc., thus ejected by the above-mentioned outbursts belong to two pyroxene andesites, which had been probably derived directly from juvenile mass.

It is noteworthy that the time-interval between two paroxysms in the recent eruptive period of this volcano was almost constant, being 12-13 days. By this eruption, also, the time-interval between the first paroxysm and the second was 10 days and that of the second and the third was 13 days.

(d) Akita-Komagadake

This volcano belongs to the Nasu-

Digitized by Google

Zone and is situated in the north-east Japan. Its base consists mostly of the neogene rocks, such as shale, sandstone, marl, tuffaceous rocks, etc. The volcano rose early in the Quaternary period on the erosion relief of the above-mentioned sedimentaries, which attain a maximum height of 1,000 m. a. s. l.

The volcano is crowned with a large caldera of horse-shoe form, opening towards south-west. The major axis, which lies in the above-mentioned direction, is about 1.5 km. long. The highest peak is Onamedake (1,637 m. a. s. l.) and the next Odake (1,632 m. a. s. l.) ; both stand near the rim of the caldera and to the north of it. Two central cones, called Medake (more than 1,500 m. a. s. l.) and Yokodake (more than 1,400 m. a. s. l.) rise in the north-eastern part of the caldera.

The volcano consists of hypersthene andesite containing either common augite or olivine, sometimes both of them.

It is said that a point somewhere in the south-east of the somma had been fuming until about 1902. But the volcano was dormant from untold ages until its recent explosion in 1932.

1932. On July 20, between 1.00 p. m. and 2.00 p. m. people who were in a cottage on the eastern piano, 9 km. from the volcanic peak, heard two thundering detonations. Ash fell on the south-eastern foot of the cone.

On July 21, 6.00 p. m., in a spa called Kunimi, 2.5 km. south-east of the active scene, the ground was in strong vibration and the people heard detonations towards the peak. The weather was rainy, so that no one ventured to visit the scene of the explosion.

On July 22, 7.00 a. m. ; 23, 6-7.00 p. m., 24, 6-7.00 p. m., detonations like thunder were heard towards the peak.

On July 24, ash covered thickly the eastern foot of the volcano.

The people in the vicinity visited the crater at first on July 26, and found that the explosion occurred just in the southern foot of the central cone at the bottom of the atrio, which is 1,000-1,150 m. high a. s. l. and is covered with thick forest. By this explosion, eight or more explosion pits were formed ; five on a line trending south-west and three, which are connected with each other, on a line trending south-south-west.

The largest pit is 70 m. long, 40 m. wide and 18 m. deep.

Some pits were emitting steam gas, SO_2, H_2S, etc., towards the end of the month of July.

Big ejectamenta, scattered within a distance of 200 metres from the pits, were rarely 2 m. in diameter. The area covered with ash extended about 2 sq. km. mostly to the eastward of the pits.

The explosion materials are not likely to have been derived directly from the juvenile mass.

Some notable phenomena associated with the present explosion are as follows :

(1) The cold water spring which was gushing out near the end of the barranco, changed into carbonated one without rising in temperature.

(2) The temperature of the hot spring of Kunimi, increased considerably after the explosion. It was 36.5° C before the explosion, but soon after the outburst, viz., on August 3 it became 45° C and it was 49° C on October 6.

(3) In Kunimi spa, the flow of the spring also increased considerably after the explosion.

(4) The water quantity of a rivulet called Sirataki, which drains the atrio, decreased.

Digitized by Google

(5) Local earthquakes were felt at the town of Oomagari, 43 km. south-west of the volcano, both before and after the explosion.

(6) The linear arrangement of the new explosion pits seems to suggest that a tectonic line lies immediately under the earth's surface.

1933. Since March 3rd, when a tremendous tidal waves occurred in the east coast of north-east Japan, the people in the vicinity of the volcano heard frequently thundering detonations from the crater.

On 23, 10.00 a. m., the ground trembled remarkably at the foot of the volcano.

(e) Asama-Yama

According to Mr. H. Tsuya, the condition of the crater in recent years has been as follows:

The crater is circular, and is surrounded by a perpendicular wall. The bottom floor is also circular with a diameter of about 300 m.

The depth of the crater was measured as follows:

254 m. in November 1931,
165 m. in October 1932,
129 m. on July 8, 1933.

In the middle of October, 1932, the crater depth was about 150 m., and a dome of red hot lava stood at the central part of the bottom floor. The rising and sinking of the dome was often clearly observed when the volcano was in an explosive activity. The height difference due to such movement amounted sometimes approximately to 50 m. in a single day. In 1933 this phenomenon could be seen no more. In the summer of 1933, a lava pit appeared at north-eastern corner of the crater bottom just under the wall cliff. The pit was 10 m. in diameter and contained red hot lava, with fragments of new lava scattered around it.

1931. On June 9, 2.10 p. m., the volcano which had been in repose since the last autumn broke its silence with an explosion, accompanying a strong earthquake.

On June 22, 3.30 p. m.; 23, 9.50 p. m., ash explosions.

On June 25, 7.00 p. m., a strong detonation and ash shower.

On June 26, 28, and 29 ash explosions.

On August 5, at 3.40 p. m., an ash explosion.

On August 6, 1.50 p. m., an explosion; 7.05 p. m., roarings and tremors accompanying an outburst.

On August 7, 3.00 a. m., red hot ejectaments of lava were hurled up in the dark sky; 3.05 p. m. a smoke explosion.

On August 10, 10.03 a. m., a smoke explosion.

On August 11, 10.00 a. m., smoke increasing; again at 4.00 p. m., an explosion with strong detonations.

On August 12, six earthquakes of volcanic origin.

On August 13, thirteen earthquakes of volcanic origin.

On August 14, from 6.00 a. m. to 3.00 a. m. next day, 376 shocks were registered on the seismogram of the Oiwake meteorological station situated at the southern foot of the volcano, while he eruption on 14th, at 11.30 a. m., was most violent for the two days.

On August 10, 8.15 a. m., a violent explosion with loud detonation. The seismogram in the Nagano meteorological station, 30 km. north-west of the volcano, recorded tremors of a maximum amplitude of 58 microns. It began at $8^h\ 13^m\ 39^s$ a. m. and continued for $4^m\ 50^s$. Large lava blocks, lapilli, sands, etc., were projected towards the east. At the Oiwake meteorological station, tremors recorded 23 times in 24 hours since 6.00 a. m. on the 19th.

In the morning of August 20 two explosions took place, each accom-

Digitized by Google

panying an earthquake. Both earthquakes were recorded on the seismogram of the Nagano meteorological station, one which occurred at 3.21 a. m., continued for $21^m\ 4^s$, while that of 9.44 a. m. continued for 4 minutes. By the first explosion, the red hot blocks of lava were projected very far from the volcano and fired the forest at its southern foot. By the second one, the smoke column attained an altitude of 12 km. above the crater. The earthquakes occurred with the outbursts of the 19th and 20th were instrumentally registered at the Seismological Institute of the Tokyo Imperial University, about 140 km. south-east of the volcano.

By these two outbursts, the ejected lava blocks gave heavy damages to the roads around the volcano. Lava blocks of 2 cubic metres were scattered on the crater rim. The thundering sounds associated with the first explosion were audible in Gihu city, 200 km. south-west of the volcano, while the area covered with ash extended to Hida province towards the west and to Gumma prefecture towards the east.

The earthquakes, which were associated with the present explosion, and which were instrumentally recorded at the Seismological Institute of the Tokyo Imperial University, are tabulated as follows:

Date			Time of the first shock			Maximum amplitude	Period
1909	XII	7	10h	43m	55s	0.177μ	5.7s
1921	VI	4	17	06	59	0.049	3.8
1921	VI	21	17	42	17	0.104	6.2
1929	IX	18	1	08	30	0.120	4.6
1930	VI	11	8	10	44	0.025	3.4
1931	VIII	19	8	13	47	0.025	4.3
1931	VIII	20	3	21	35	0.029	4.9
1931	VIII	20	9	44	19	0.032	4.8

On August 22, at 3.00 a. m., an ash explosion.

On August 27, at 8.00 p. m., a fire column.

On August 29, at 6.00 p. m., a smoke explosion.

On September 2, 1.20 p. m., the earth shook for two minutes, then an explosion with huge detonations followed; lava blocks fell on the flank of the mountain, causing heavy damages to the villages in the vicinity.

On September 3, 4 and 5 ash explosions with detonations.

On September 6, 0.30 p. m., ditto.

On September 13, 4.00 a. m., two earthquakes at first, then an explosion with detonations. In the town of Taira, near the coast of the Pacific Ocean, 220 km. east of the volcano, fine ash veiled the sky in the early morning of the same day.

On September 1-18, 64 tremors were observed at Oiwake.

On October 21-24, 43 tremors were observed.

On October 21, 23 small explosions.

On December 8, 7.33 a. m., a great explosion took place with smoke clouds of pine form, which rose 6 km. high above the crater. The meteorological station of Maebashi, about 35 km., east of the volcano, reported that the explosion was the strongest since September, 1928.

By the air shocks, about 40 pieces of window panes were broken in Karuizawa railway station, 10 km. south-east of the crater.

The eastern flank of the volcano was covered with large lava blocks while the town of Karuizawa was showered with lapilli for 5 minutes.

In a region more than 20 km. south of the crater including three villages,

Digitized by Google

Iwata, Konuma and Saku, the air shook very strongly. It is said that the explosion was the most violent in the last 30 years.

In the city of Maebasi, the ash shower began at 7.45 a. m. lasted for 20 minutes.

At the city of Nagano, the earth shook as large as 32 microns at maximum.

In the region of Titibu, about 80 km. south-south-east of the volcano, an air shock was felt very strongly at first, then at about 9.30 a. m. ash veiled the sky. In the city of Kumagai, 80 km. south-east of the volcano, ashes showered from 8.50 a. m. to 9.18 a. m. Ashes precipitated even in the city of Noda, 150 km. south-east of the volcano, at 8.00 a. m., and also in the harbour of Yokohama, 150 km. south-south-east of the mountain, at about 11.30 a. m.

1932. On February 15, 6.55 a. m., an ash explosion with detonations. In the city of Maebasi ashes fell between 7.50 a. m. and 9.00 a. m.

On February 18, 0.45 a. m., dark smoke emissions,—9.30 a. m., another explosion accompanied by detonation.

In both cases ashes rained in the town of Karuizawa.

On February 19 and 20, minor explosions.

On February 24, 10.24 a. m., an explosion of dark smoke accompanying showers of lapilli and ash in the eastern foot of the volcano.

At the south-eastern foot of the mountain a forest took fire by the glowing projectiles. Again at 4.45 p. m. another explosion.

On February 28, 9.15 p. m. an explosion.

Through the month of March, the crater was in an eruptive activity, throwing ash continuously. Explosions were paroxysmal on the following days: March 1, 2, 3, 8, 10, 11, 12, 14, 15, 16, 18, 25, 26, 28, 30, 31. Among those occurred in March the more violent outbursts are described in the following lines.

On March 1, 4.00 a. m.; 3.10 p. m., 6.00 p. m., ash explosions.

On March 2, 9.10 a. m., a dark smoke explosion with showers of projectiles, among which lava blocks of two cubic metres were found on the eastern flank of the volcano. Sand and ash covered an extensive area, east of the crater, they reached the city of Takasaki, 35 km. south-east-east of the volcano.

On March 3, 9.18 a. m., an explosion.

On March 10, 10.50 a. m., an explosion with smoke columns, 1.5 km. high above the crater rim.

On March 11, 4.11 a. m., explosions with three detonations like thunder.

In the spa of Kusatu, air shocks were very strong.

On March 16, 7.00 a. m., an explosion.

On March 18, 0.15 a. m., a fire column accompanying red hot projectiles.

On March 25, 8.25 a. m., smoke clouds and showers of red heated lapilli in the region east of the volcano. At about 9.30 p. m., ashes precipitated in the city of Tokyo.

On March 30, 4.03 p. m., an explosion, ashes showered in the city of Takasaki.

On April 1, 1.25 p. m., an ash explosion.

On April 2, 3.20 p. m., an explosion.

On April 4, 4.00 p. m., an explosion.

After this explosions were observed on 13, 14, 16, 25 and 26. In the month of May, the explosions were observed on 1, 5, 8-11, 13, 16-20, 23 and 28-29, of which the followings are more important.

On May 1, 2.10 p. m., an explosion with detonations and ash showers.

Digitized by Google

On May 4, 6.00 a. m., an outburst, accompanied by an earthquake of a maximum amplitude of 4 microns at the Nagano meteorological station.

On May 5, 5.55 p. m., a strong explosion with a heavy rain of ash on the eastern neighbourhood. In the city of Kumagai, ashes showered at about 9.50 p. m.

On May 9, 7.15 a. m., an explosion with ash shower, which damaged the mulberry plantations in the regions of Takasaki as well as Saitama, near Tokyo.

On May 11, 2.00 p. m., an explosion with dark smoke.

On May 18, 6.30 p. m., an explosion.

On May 19, 1.20 p. m., an explosion.

On May 28, 1.19 p. m., an ash explosion with detonation and fire.

On May 29, 4.28 p. m., an explosion.

In the month of June, explosions were big on the days ; 4-5, 7-10, 12-14, 24-26 and 28-30, of which, the stronger ones were as follows.

On June 24, 2.00 a. m., an explosion with tremblings, which continued until the 25th, 7.00 a. m. ; 51 tremors were recorded on the seismogram of the Oiwake meteorological station.

On June 25, 2.00 p. m., a strong explosion.

On June 28, 9.06 a. m., an explosion with detonations which were heard in the region of Titibu, 85 km. south-east of the volcano. In the vicinity the clocks were stopped by air shocks.

On June 29, 4.30 a. m., an explosion accompanying an earthquake, by which a railway train was obliged to stop for 7 minutes at a point between Oiwake and Kutukake in the southern foot of the volcano.

In the month of July, the explosions were violent on 1-3, 9-13, 15-19, 23-24 and 29-30, of which only two were big.

On July 3, 5.03 a. m., an outburst.

On July 10, 6.00 a. m., an explosion with roarings and tremblings which continued about 24 hours.

In August the frequency of tremors decreased.

On September 3, 3.00 p. m., an explosion took place with detonations, then ashes showered in the region of Matuida and Annaka near Takasaki.

After this eruption, the crater was quiet for a long time, but tremors originated in the volcano were often registered on the seismogram of Oiwake on the following days.

1932 : November 2 and December 2, outbursts.

1933 : January 9, February 5, March 8, April 11, May 1, June 6, July 10 and August 3, explosions.

1934. On January 9, 4.45 p. m., a smoke explosion with thundering sound.

On February 11, 2.00 a. m.,—7.30 p. m., in each case, dense smoke was vomitted and ash-rain followed.

(f) Kusatu-Sirane-San

As this volcano manifested a remarkable explosion in October, 1932, a brief description about the volcano will be given at first.

The volcano stands north of Asama-Yama, 25 km. from it. The base of the volcano consists of the neogene formation with gravels, shales, marls, tuffs, breccias, etc. Here and there it is penetrated by intrusive mass of porphyrites, etc.

The eruptive activity of this volcano began at the close of the Tertiary epoch. In the first stage, ash, pumice, volcanic breccia, etc. were emitted ; in the second stage, lava issued principally. The lavas of this volcano belong mostly to the two pyroxene andesites, such as quartz bearing one ; quartz-biotite-

Digitized by Google

bearing one; biotite-bearing one; olivine-bearing one, etc.

The volcano has two peaks on the top: Moto-Sirane-San, one of the two, is the peak of the volcanic cone and is 2,176 m. a. s. l., while Sirane-San, the other, is a side cone and is 2,162 m. high a. s. l. Sirane-San stands north of Moto-Sirane-San and is joined to it with a saddle-shaped rise. The cone of Sirane is likely to be a monogene volcano crowned with a circular shallow depression, of which the diameter is about 600 m. Three combined explosion craterlets are situated in the eastern part of the above-mentioned depression, and lie on a line, running in north-west-west direction.

Each of the craterlets is circular in shape and surrounded by a steep wall except those parts where two make contact. They are called Midugama, Yugama and Karagama; Midugama (water caldera), the eastern one, is 200 m. in diameter; Yugama (hot water caldera), the central one of the three, is 250 m. in diameter while Karagama (empty caldera) the western one, is 150 m. in diameter.

On the floor of the crater bottom of Yugama, sulphur has been mined for a long time.

The history of the activity of this volcano is as follows: About 120 years ago, the volcano was fuming constantly, but since it was in repose for about 70 years.

1882. On August 6, 2.00 p. m., Yugama showed a big explosion after long repose, ejecting lava blocks, lapilli, etc. At the same time mud flowed out from the crater.

This outburst continued more than ten days.

1897, In January, roarings began and they continued with increasing intensity and frequency until the month of July.

On July 8, 4.00 a. m., Yugama manifested a paroxysmal explosion, which terminated in a short time, so that the sulphur miners could work again soon after.

On July 31, 5.00 a. m., another explosion took place in the Yugama craterlet and a sulphur miner was wounded by a barrage of projectiles. Several new pits as well as fissures were formed by this outburst.

On August 2, 2.00 a. m., and 2.30 p. m., explosions took place and a sulphur miner was wounded by the ejectaments. The activity continued until the 16th of the same month.

1900. On October 1, an explosion.

1902. On July 15, 4.00 p. m., an explosion occurred on a hill standing near the saddle part between the two peaks, Sirane and Moto-Sirane.

On August 20, another explosion.

On September 4, an ash explosion.

On September 17, 1.00 p. m., an explosion occurred continuing four days.

On September 23, and 24, explosions.

1905. In October, explosions.

About in the year 1910, the water of Yugama lake was boiling. The water temperature of the lake measured in the year 1916, showed 50°C and the several subaqueous pits were spattering water spray on the surface.

1925. On January 22, an explosion occurred and thereby a fissure, 20 m. long and 7 m. wide, was formed on the wall of the craterlet of Yugama.

1927. On December 29, 7.00 a. m., an explosion and 30, 9.00 a. m., roarings: and 31, 11.00 a. m., an ash explosion. (In the former note in the Japanese Journal of Astronomy and Geophysics, Vol. IX, No. 1, these explosions are described as the events of 1928, but they must be corrected as those of 1927.)

1932. On October 1, 1.54 p. m., an explosion took place in the Yu-

Digitized by Google

gama craterlet, and lava blocks, lapilli were ejected and mud flowed from a new pit. Twenty miners, who were working just at the moment of the eruption in the floor of the crater bottom, came under a barrage of projectiles, and two persons were killed and seven were wounded.

On October 4, 2.30 p. m., an ash explosion.

On October 6, 3.00 p. m., an explosion.

On October 8, 6.40 a. m., a minor explosion.

On October 14, 3.00 a. m.; 16, 7.40 a. m.; 18, 9. 20 a. m.; explosions.

On October 23, 10.25 a. m.; an outburst took place and it continued until the evening. The explosion was paroxysmal in character, and the smoke column attained sometimes an altitude of 13 km. above the crater.

On October 24, about 10.30 p. m., an ash explosion.

On October 27, 9.03 a. m., a small explosion.

During the month of November, ash-rain fell at the spa of Kusatu, on the eastern foot, 6 km. from the Yugama craterlet.

By these explosions, ten pits were newly formed: 7 of them. on the north-eastern wall of Yugama and the other on the southern shore of the lake in the same craterlet.

On November 4, 20, 23, smoke quantity augmented.

On December 18, 19, a smoke explosion.

1933. On January 7, 20, smoke increased.

On March 8, 15, 31, smoke clouds.

On April 1, smoke clouds.

On June 5, 4.00 p. m., smoke increased.

On June 11, in the morning, smoke.

On August 1, smoke clouds.

On September 7 and 18, smoke clouds.

Norikura Zone

(g) Yakedake

1931. On June 18, 11.40 a. m., an explosion took place on this volcano for the first time since May, 1927. A new crater pit, about 60 metres in diameter, was formed on the western flank of the dome at the top of the volcano, and the lava blocks of every size were scattered in the vicinity of the crater. At about 1.30 p. m., the explosion terminated.

On June 23, 2.30 a. m.—11.00 a. m.; strong explosions with rumblings and ash-rains.

On June 24, 2.51 p. m., an explosion.

1932. On February 4, smoke increased.

On February 6, 10.35 a. m., a dark smoke column, with detonations and ash precipitation at the western foot of the volcano.

Fuji Zone

(h) Hakone

1933. On May 10, 2.0 p. m., a solfatara in the Oowakidani crater exploded with a big detonating sound. As the labourers of the spas of Hakone were working near the solfataras to put conducting pipes of hot water under the ground, mud gushed up from a new pit suddenly about two metres high. A workman happened to come under the heated mud and died. The activity terminated with this single explosion.

(i) Miharayama in Oosima

1933. From the beginning of October the explosive intensity was increasing, and red hot lava was gushing out on the crater bottom. On October 14, early in the morning, an outburst took place with detonating sounds. Since that day the roar-

Digitized by Google

ings were heard very often and sometimes fire could be seen above the crater in the night.

1934. On April 18, 5.0 p. m., dark smoke covered the summit after weak rumblings. The smoke eruption continued about one hour. The eruption seems to have occurred in the following way; a part of the crater rim slipped down and the avalanched detritus pressed the surface of the lava lake on the bottom so as to cause an outburst.

(n) Iwōzima volcano

According to a newspaper, the following eruption is likely to have occurred. "On April 2, 1934, 6 p. m., the volcano Iwōzima manifested an explosion all at once in its old crater and a new pit was formed thereby." On this eruption, we can say nothing about the exact position of the volcano, as the name Iwōzima is ambiguous.

Aso Zone

(j) Aso volcano

Aso is the most active volcano in South Japan; it has repeated eruption very frequently since remote time. The active crater lies on the top of Nakadake, one of the central volcanoes in Aso caldera. The diameter of the crater is about 1 km. from N to S and about 400 m. across. The crater contains three craterlets divided by two ridges; they are called the north crater, the middle crater, and the south crater. The north crater consists of two craterlets; the northern and the southern. For the sake of convenience let us call them as follows; the first, the second, the third and the fourth crater respectively instead of the northern craterlet in the norh crater, the southern craterlet in the north crater, the middle, and the south.

The eruptive centre of Aso volcano seems often to change its site. It was in the first crater in the beginning of the present century; later the fourth became active for about twenty years up to about 1930. Recent eruptions have been occurring again in the north crater, while the south is at present dormant, containing water in it.

1931. On August 18, clouds of white smoke were vomitted from the base surface of the south crater.

1932. In March, both craters, the second and the fourth, were filled with water.

In June, the first crater showed a minor explosion with rumbling sounds.

On June 27-28, mud explosions in the same crater.

On September 4, 11.00 a. m., an ash explosion accompanied by roaring sounds took place at the corner of the fourth crater.

On November 8, a smoke explosion.

On November 19, an ash explosion.

On November 24, explosions.

On November 25, 7.10 a. m., eruption was paroxysmal in its character and took place periodically every 10-15 seconds, and by the paroxysms dark smoke columns were vomitted, attaining sometimes an altitude of 200 metres above the crater rim. Large scoria were scattered near the crater while volcano sands called "yona" fell in the vicinity. By this eruption new pit, about 15 m. long and 5 m. wide, was formed on the bottom of the first crater.

On December 7, 1.07 p. m., after a big detonation, fire columns stood high in the sky, red hot scoria having been ejected up to a height of 300-400 metres above the crater rim. Each eruptive paroxysms continued about 5 minutes with an intervening repose of 10-15 seconds. A new

Digitized by Google

pit was formed on the north-western part of the wall of the craterlet.

On December 9, in the night, the air shoock very strongly on the flank of the volcano about 1 km. from the crater.

1932. On December 16, from the evening to the morning of the next day, explosions were very violent accompanying prolonged detonation like thunder.

On December 17, 0.58 p. m., 1.20 p. m., and 2.12 p. m., after strong detonations red hot scoria were ejected as high as about 300 m. above the crater rim. By the explosion of 2.12 p. m., large lava blocks were thrown up; one 3 m. in diametre was found within a distance of about 300 m. from the crater. In the night, the column of red hot scoria illuminated the vicinity.

On December 18, 7.30 p. m., heavy showers of scoria fell on the crater rim and some tourists who visited the active scene just at that moment, were wounded by the ejectamenta.

On December 20, the eruptive force reduced remarkably.

1933. Since January, the lake water in the second crater diminished.

On February 11, a new pit, 30 m. in diameter, was formed by an explosion at the western rim of the second crater and hot mud of dark gray colour was gushing out from it.

On February 15, 6.40 a. m., an explosion.

On February 22, another pit was formed in the second crater.

On February 24, strong explosive paroxysms with detonatic sounds took place in every 2-3 seconds. As the period of paroxysms became longer, the eruptive force augmented more and more, until a large block of lava, 6-8 m. long and 0.5 m. thick, was thrown to a distance of 600 m. from the crater. Even scoriaceous lava block with 1 m. diameter was ejected often to a distance of 1.2 km. while smoke column attained sometimes a height of 1 km. above the crater rim.

As soon as the maximum force of the outburst was reached on this day, the activity of the second crater became remarkably feeble. At the same time the eruption of the first crater increased rapidly.

On February 26, 27, terrific outbursts continued.

About February 28, the first and the second craters were simultaneously active with equal intensity of eruption, vomitting abundant quantity of smoke illuminated by the electric flashes.

On March 1, the first crater was more active than the second.

On March 3, the eruptive intensity of the first crater began to diminish.

On March 9, 4.00 p. m., the second crater again became more active than the other.

According to the seismogram of the Aso Volcanological Observatory, which belongs to the Kyoto Imperial University, and is situated 7.5 km. westward from the crater, the amplitude of the explosive earthquakes responsible to the first crater was gradually increasing from the beginning of December, 1932 and culminated 0.3 microns at maximum on about the 30th of the same month. It must be noted that the maximum amplitude was reached after the explosion intensity attained its maximum on December 17.

As regards the activity of the second crater, the amplitude of the explosive earthquakes increased rapidly on February 24, and the next day it attained a maximum of more than 70 microns, but again decreased abruptly. The time of the maximum intensity of the eruption and that of the maximum amplitude of earthquake thus coincided exactly in the

Digitized by Google

present case.

By the above mentioned eruptions of the first and the second craters, the scoriaceous ash, or "yona" fell on an extensive area even at a distance of 100 km. northwards from the crater. The large blocks of scoriaceous lava was spread around the crater and reached a distance of 1.2 km.

According to Mr. Kawano of the Tohoku Imperial University, the ejecta including lava blocks, scoria, lapilli, ash, etc., is basaltic andesite containing about 52% of SiO_2.

On April 6, the second crater exploded.

1933. On May 1-2, explosions in the second crater.

On May 3, an ash explosion in the first crater.

On May 3-5, the eruptive centre removed to the second crater, and the outburst was intermittent. In the night of the 5th, the ground shook strongly.

From the 6th, the paroxysmal explosions in both craters continued to the end of the month, and by each paroxysm, dark cloud with electric lightning and red hot scoriaceous lava were thrown up sometimes 250 m. high above the crater rim.

On May 18, 7.00 p. m., outbursts, with strong detonation and red hot scoria hurled out occurred in both craters, the first and the second.

On August 8, explosive intensity of the first crater increased towards the middle of the month, since then, again abated gradually.

On August 26, the activity of outburst was renewed; the smoke often attained a height of 1.3 km.

In August the second crater was quiet while the fourth crater was replaced with water, white fume rising from the centre of its surface as high as about 100-150 m.

On September 8, the small lake in the fourth crater became ramarkably shallow.

In September, explosions occurred in the first crater on the days; 2, 3, 5, 9, 24, 25 and 28, of which that of the 24th was big.

On September 24, 7.00 p. m., a paroxysmal explosion with 2-3 hours' period and followed by strong showers of red hot scoria and sands.

Kirisima Zone

(k) Kutinoerabu

This island volcano belongs to the Kirisima Zone and is situated in SSW of Satanomisaki, the southernmost cape of the island of Kyusyu, and 12 km. west of Yaku-sima island. It is about 12 km. long in NWW direction and 5 km. across. The volcano has two peaks, Hurudake, the highest, is 649 m. a.s.l. and the other Sindake, 640 m. a.s.l. Sindake, or the new peak, has many solfataras in its crater, sulphur mining having been operated there.

The recent eruptive scene is the crater of Sindake, which lies at 130° 138′ E and 30° 27′ N.

Among the records on the past eruptions, those of 1841 are to be regarded as authentic.

1841. On May 23, an outburst.

In August, a big explosion occurred and enormous quantity of ejectamenta was thrown out, thus devastating the villages at he western foot of the volcano, such as Motomura, Mukaehama, etc.

It is said that about 28 years ago roarings and tremblings were felt by the islanders.

1914. On January 5, just one week before the great eruption of Sakurazima, a part of the crater wall of Sindake avalanched, accompanying roarings and smoke emissions.

1931. About March 20 and following one week, roarings and tremblings took place very often.

Digitized by Google

On April 2, about 7.00 a. m., noon and 3.00 p. m., sulphur miners on the mountain felt violent shocks of the ground with thundering sounds.

After the labourers had left the mountain, strong rumblings were heard at about 3.45 p. m. and 6.48 p. m., and finally 7.44 p. m., a disastrous explosion took place. Dark smoke columns with electric lightnings stood high in the sky, detonations were heard and soon after a heavy shower of ejectamenta including ash and lava block followed. The explosion terminated with this single paroxysm, but four tremors were recorded on the seismogram of the Kagosima meteorological station, 135 km. north of the eruptive scene, on the day of the outburst.

By the explosion of 7.44 p. m., the thunder-like detonations were heard in some islands near Kutinoerabu and even at Makurazaki in the Province of Satuma, 92 km. away from the crater. Ashes spread over the island, especially thick on an elliptical area including the Mukaehama at the north-western foot of the volcano. Vast area of the mountain flank was devastatel by the flows of lava blocks of every size.

On May 15, an explosion.

On June 6, 3.30 p. m., another explosion.

On June 22, 7.00 a. m., an outburst began with big detonating sounds, ash rain having soon after followed it. The villages of Mukaehama and Yumukai were covered with ash 1.5 cm. thick.

1932. On July 23, eruptive activity was reported.

1933. Since the middle of December, the temperature of the solfatara in the Sindake crater increased remarkably.

On December 23, in the evening ashes rained slightly in the vicinity. In the night some fishers on board the fishing boats saw fire phenomena on the summit.

On December 24, 2.00 a. m., some people observed a weak fire phenomena above the crater. At 4.10 a. m., a disastrous explosions took place with awful detonating sounds; it continued about 10 minutes. Huge columns of dense smoke rose about 600-700 m. high above the crater, electric lightning illuminating them.

Ejectas were abundantly projected towards SSE; 8 persons became victims. A hamlet called Nanakama, 1.5 km. away from the crater was burnt by fire caused by glowing blocks of lava, while an immense area of forest was completely devastated.

On December 27, 1.00 p. m., an ash explosion.

On December 31, 8.30 p. m., an explosion took place for several minutes, accompanying thundering detonations. Dense cloud of smoke rose on the crater causing the rain of ejectamenta in the vicinity.

1934. On January 11, 4.15 p. m., a strong explosion occurred after roarings. At first it strongly thundered three times, then the cauliflower of dark smoke with electric flashes rose as high as 1 km. above the crater. Ashes fell to the east on the sea and reached Yakusima Island, 15 km. east of the crater.

Two volcanologists, Profs. T. Matumoto and F. Homma, were, just at the moment of the outburst, standing on the eastern flank of the volcano, where they experienced heavy shower of ejectas.

After this outbreak, the explosive activity abated rapidly.

On January 12, 6.00 a. m., ash precipitated in Yakusima and at 1.13 p. m., dark clouds veiled the summit.

According to Prof. F. Homma of the Kyoto Imperial University, the times of outbursts during the last explosive period coincided with those of high tide in the locality. Further,

Digitized by Google

the explosions took place almost always one or two days after it had heavily rained on the mountain.

Considering that the ejectamenta including ash, sand and lapilli are all pre-existing materials, the outbursts of the recent period of eruptive activity of this volcano may be regarded as belonging to the ultra-volcanian type.

(l) Subsidence of the bottom of Kagosima Bay (Ahira Caldera) in Kyusyu

1931. In the month of June, it was reported that a part near the village of Sirahama, on the northern coast of Sakurazima, the sea bottom subsided remarkably.

The depressed part lies about 20 metres off the coast in the time of the high tide and 4 metres in the ebb time. The area is somewhat circular with 36 m. diameter, and now it is 6 metres deep below the low tide level; the subsidence amountd to about 4 metres. It lies in the submarine part of the piano of Sakurazima volcano, which is the central cone of the caldera of Ahira (this name is proposed by Prof. T. Matumoto for the circular depression of the northern end of Kagosima Bay), and is situated in the subsided region due to the great eruption of Sakurazima in 1914; so the depression phenomenon seems to be of volcanic origin.

(m) Subsidence of the bottom of Toya lake in Hokkaido

1932. On May 19, in the morning, a part near Muko-Toya village and off the northern coast of Toya lake about 40 metres from the shore, the water was bubbling. According to the result of sounding, an elliptic area 100 metres long from east to west and 60 metres wide subsided as much as about 11 metres, and it is 13 metres deep at present.

At the end of May, the water temperature was 11°.3 C in the subsided part while it was 5°.5-7°.3 C in other parts of the lake, the normal temperature of the lake water in the month of May being 5°.0 C or thereabout. Lake Toya is situated in the caldera of the same name, its central part and southern rim having been the scenes of volcanic activity since the caldera formation. The islands in the central part of the lake are volcanic domes of the post-caldera time. Volcano Usu on the southern rim of the lake basin is now active; its eruption in the year 1910 is very well known by volcanologists. The present depression phenomenon of the ground, therefore, seems to be of volcanic origin.

Concluding remarks

The volcanic activities so far mentioned may be grouped into the types as follows:

1) Ultra-volcanian type of eruptive explosions. This type has been manifested in recent years by many volcanoes as, for instance, Kusatu-Sirane-San, Akita-Komagadake, Kutinoerabu, etc.

Among these outbursts, that of Akita-Komagadake is notable, though the explosion was of minor strength. This volcano had been dormant since untold ages up to the recent outburst, which occurred suddenly on the bottom of its large caldera without any premonitory sign. The scene of the explosion has been covered with thick forest, and the outburst occurred in linear fissures.

The minor outbursts such as those of Mihara-Yama, Hakone, etc., seem apparently to belong to the present type, and they are merely simple superficial phenomena having no connection with the inner mass.

2) Volcanian type of eruption. Many minor explosive paraxysms of Asama-Yama belong to the Volcani-

Digitized by Google

an type, the ejectamenta including lava blocks, lapilli, ashes, etc., being derived from both origins the secondary and the primary. Some strong eruptions of the volcano seem to belong to the Strombolian type, projectiles in this case being regarded to be of primary origin.

The explosions of the volcanoes of Tarumai and Yakedake are for the most part of Volcanian type. Each volcano has a lava plug in its crater, while the explosions occur in the fissures which run across it and from which lava fragments are thrown out. But in some violent outbursts the ejectamenta seem to be of juvenile character.

The eruptions of the island volcano Harumukotan in the Kuriles possibly belong to the present type.

3) Strombolian type of eruption. Volcano Aso in Kyushu manifests this type of eruption, red hot scoriaceous lapilli, sands and ash being ejected from the crater in each eruptive paroxysm.

The new volcanic islet near Alaid seems to be built up by dark scoria, products of the eruption of the present type. The eruption of the island volcano Uraccas in Marianas in recent years is said also to be of the same type.

4) The depression phenomena of a part of the bottom in the calderas of Tōya in Hokkaido as well as of Ahira in Kyushu are most remarkable. It may possibly be that the subsidence process in the course of caldera formation is not yet terminated in those places.

Botany

A Contribution to the Knowledge of Regeneration in Higher Plants

By Kinzirō Kakesita

The author has induced the regeneration in Bryophyllum calycinum and B. crenatum even in the leaves attached to the stems, which consists in the formation of new roots and shoots in the notches. The methods were the warm-bath treatment, and the confinement which H- or N-gas for a certain time. According to the author's view, such treatment will induce the anaerobic respiration, and its products act as stimulants for the regeneration. In fact the author could induce this process by the injection into stems and leaves of certain products of anaerobic respiration, especially acetaldehyde and ethyl alcohol. Further, the author could ascertain the accumulation or formation of acetaldehyde, alcohol and organic acids in the attached leaves subjected to the above treatments.

Botanical discoveries on the Citrus flora of China

By Tyōzaburō Tanaka

The paper is concerned with the description of the results of studies by Western and Japanese authors, incl. those of the author himself. The introduction of various Chinese Citrus forms into Europe as well as Japan is described. As to the Citrus flora of China the author's general conclusion is : in the southernmost region of the Chinese coast citrons, lemons, sweet oranges, shaddocks, and large-fruiting mandarins are predominating. Towards the north the lemons disappear, and large-fruiting loose skin oranges as Ponkan and Tankan take the lead. Still towards the north the citrons disappear and small-fruiting mandarins become important. In the northernmost region only hardly species like Citrus junos and small-fruiting mandarins exist while others disappear.

Plants susceptible to dwarf disease of rice-plant

By Teikichi Fukushi

It is well known that certain virus diseases are transmitted by the agency of some leafhoppers. The auther tried to study experimentally the transmission of dwarf disease of rice by the agency of the leafhopper, Nephotettix apicalis var. cincticeps. It was found that Panicum miliaceum, Echinochloa crus-galli Beauv. subsp. colona var. edulis Honda, Alopecurus fulvus and Poa pratensis are subject to the attack of the virus of the rice-plant. But corn, Italian millet, barely and Sorghum gave negative results, so far as the author's experiments have shown. These plants are inappropriate as food of the leafhoppers, for the latter could live on them simply for 15 days to die sooner or later.

Studies on the influence of ultra-violet rays on the physiological activities of Azotobacter I. On the lethal action

By Arao Itano and Akira Matuura

The authors have studied the influence of ultra-violet rays on Azotobacter chroococcum by using the mercury lamp of Hanovia. The variation of the intensity of ultra-violet ray during the experiment was so, that the discolouration of acetone methylene blue was 3.0-2.5 after one hour, and by the molybdic acid method aH (activated hydrogen) was 2.1-1.6 after 10 min. Though the intensity of ultra-violet rays is variable according to the distance between the light source and the object of which the influence of rays is to be studied, yet in the authors' experiment the difference of the intensity in different distances was not very great. The plate culture of Azotobacter in Petri dish of hard glass does not die after 2 hours; that in "Acme" ultravit glass for 1 hour grows very weakly and dies after 2 hours, while that with no cover dies after 30 seconds. The liquid media culture in quartz test-tube dies after somewhat more than 5 minutes, the number of bacteria being greatest after 5 seconds, even greater than in the control. In liquid media culture in ordinary Erlenmeyer's flask of hard glass we see the decrease of the individual number, the quantity of fixed nitrogen as well as of pH, but not the death. Both in plate and pure culture the exposition of bacteria to ultra-violet ray for a short moment stimulates their activity.

Matsudake of Japan and America

By Kogo Togashi

The study of an American mushroom which the Japanese living in the Pacific border, Oregon and Washington use to identify with the famous Japanese Matsudake (Armillaria Matsutake) revealed the fact that it is really Armillaria ponderosa (Peck. Sacc., Syn. A. arenicola Murrill, A. magnavellaris Murrill). Both are very similar to each other, but in the American species the cap is much paler in colour and the development of scales less significant than in the Japanese one.

Geology and Geography

On the Use of Standard Glass Powders in Refractive Index Determinations

By Teiroku Sueno

The author proposes the use of standard glass powders in refractive index determinations with the microscope. By this method the refractive index and the dispersion of the immersion liquid can be determined simultaneously with those of the crystal mounted on the microscope stage, without the Abbe refractmeter. The method of preparing the standard glass is also described in detail.

The Stratigraphy and Structure of the District Northeast of Heijō, Korea

By Susumu Matsushita

The district northeast of Heijō is composed of the gneiss system, Shōgen system (Proterozoic), and Chōsen system (Cambrian and Ordovician). The gneiss is intrusive into the Shōgen system (lower, mica schist; upper, limestone and dolomite), which is overlain unconformably by the Chōsen system (lower, phyllite; upper, limestone and dolomite). The Shōgen and Chōsen systems, which generally dip northeast, are believed to have suffered overturned folding. The age of the folding may be supposed to be late(?) Trias, because the Chōsen system, on which the Heian system (Anthracolithic and Trias) rests unconformably, is covered unconformably with the lower Daidō formation (Lias). There are two low-angle thrusts, dipping NW or N, and affecting all the formations above stated. The thrusting is believed to be due to the late Jurassic disturbance. The high-angle faults (chiefly normal), which formed later than the thrusts, run in three directions: E-W, NNE, and NNW, those in the NNW direction being important. Since dykes of quartz porphyry intruded along the NNW fault line at the end of the Cretaceous, the age of the main faultings is concluded as being late Cretaceous.

Shore Profile of the Pacific Coast of NE Japan

By Sadao Yamaguti

From the numerous shore profiles represented along the Pacific coast of northeastern Japan we can read the crustal movements that have affected these regions.

It was not only once that the land rose and sank. The depth of submergence of this region, that is, of an ancient mouth, was measured from a point in reference to which the profile of the bay bottom changes its angle of inclination. Besides policyclic crustal movements there were differential movements. While one region had upheaved in a straight line by mere tilting, another had deformed in a series of elevations and depressions, resulting in a wavy surface, at the junction of which two forms of crustal movements or the existence of a flexture axis may be inferred.

In this paper, the coastal profiles of the northern half of the Kitakami district and the sea bottom profiles, or their differentiated curves, alone are given.

Engineering

The Process of Creep of Metals

By Atumaro Simizu

By combining a mechanical lever or mechno-optical device with a rotating drum, more minute time-elongation curves for steel and aluminium were obtained with a magnification of deformation of 100 or 180 times. Summarising the results, the author holds that creep is not a mere plastic flow of metal, as generally expressed, nor is it a mere repetition of sudden yielding, depending only on the temperature; but an alternate repetition of two kinds of deformation.

On the Bottom Structure of Steel Ships

By Teruo Ono

The paper consists of two parts: 1. Standard for the strength of floor girders. 2. Spacing of transverse strength bulkheads or of compound floor girders. The conclusions is.

1. The modulus of resistance of the floor girder, either of signal bottom or double bottoms at the centre line of a ship ought not to be less than that of a freely supported straight beam of constant cross section, and of a length equal to the moulded breath of the ship, carrying uniform load corresponding to a head of water equal to the light draught of the ships.

2. The spacing of transverse strength bulkheads or compound floor girders should be decided on the bases of the strength of floor girders, longitudinal bottom girders and number of longitudinal bottom girders, and further in cases where skeleton floors are fitted, the spacing of solid floors should be taken into account.

3. In cases where bilge bracket is dispensed with in single bottom, great care must be taken with regard to construction of the floor girder as a whole.

A Study of Wave Formation and Water Flow Contiguous to the Bottom Surface of Seaplane Floats

By Tetsuo Miki

Two pairs of seaplane floats were tested in an experiment tank, and plan view of the bow waves photographed. As the actual flow lines were obtained by towing the models while the coat of white paint on the bottom surface of the floats was still wet, the streak traces were shown quite clearly. The water lines during gliding could be ascertained. The hydrodynamic lift was deduced by substracting the computed hydrostatic buoyancy from the total force acting upward.

Water at the bow rises along the bottom surface forward to the head of the float and is then thrown sideways. The bow sheet forms the undesirable dirtiness, which often accounts for damaged propellers. The whole sheet around the floats takes the form of butterfly wings, the roots of which are the crests of the bow wave.

Discontinuity, if any, in the resistance curve appears to be the difference between water resistance and air resistance at the back of the step. As to the symmetry and form of the flow lines at the bottom, little difference was found between the single float and the twin float arrangement.

The Effect of Temperature on Strength of Wood

By Tuneo Inokuty

Impact bending tests were carried out on specimens of spruce and plywood between the range of temperatures from +60°C. to −60°C. Results show that in both spruce and plywood the mechanical properties change with variation of temperatures. Thus the absorbed energy shows a minimum between 0°C. and −10°C., and the equivalent modulus of rupture increases almost linearly with decrease in temperature. Moreover prolonged cooling produced no difference in the results as compared with those cooled for a short time. It was also observed that test pieces which were first cooled and then restored to normal temperature regained their original properties.

A Design Formula for Ailerons

By Taichiro Ogawa

In the design of control surfaces of an aeroplane there is an element of risk in that the designer has only his own experience and the judgement of test-pilots to rely on. In this paper, the constant initial angular acceleraion is calculated for an aeroplane flying with minimum velocity, and rolling soon after the aileron has been suddenly actuated. The conclusion is that control surfaces should be so designed that the angular acceleration shall be greater than the mean value of the angular acceleration for that class in which the aeroplane belongs.

Precautions against Thunder-Storm Disturbances in Electric Power Transmission Systems

By Kurakichi Takasawa

The Tokyo Electric Light Co. and a number of other companies that supply electricity in the districts of Tokyo and Yokohama decided to take precautions against disturbances caused by lightning in electric power transmission systems, by arranging with the Central Meteorological Observatory to receive due warnings of approaching thunderstorms.

This plan came into operation in 1929. In an area of about 75,000 square kilometres with Tokyo City as centre, 233 stations for observing thunder-storms were selected from line-men's quarters of transmission lines, generating stations, and substations, as Thunder-Storm Stations. Operators in these stations, besides their routine work, were assigned to observe thunder-clouds and thunder-storm in compliance with the thunder-storm code provided by the Central Meteorological Observatory and to report to the Observatory, who would issue warnings of thunder-storms, and their intensity and direction of travel to enable provisions being made for emergencies.

In case of need, the transmission systems were to be divided into as many small units as possible, so that the extent of damage and the range of disturbance caused by lightning strokes could be reduced. In this way, remarkable improvement in electric service was effected by carrying out appropriate emergency measures beforehand.

The paper describes the characteristics of thunder-storms, gives statistics of accidents caused by lightning strokes on the six principal transmission systems of 110 kv. and 154 kv.

The Electrical Companies, by inaugurating this system of thunder-storm forecasting, have not only derived great benefit from it, but have also helped to clarify the gen-

Digitized by Google

eral local characteristics of thunderstorm generation and their course of travel.

On the Vapour Pressure of a Mercury Lamp

By Tsunesaburo Asada

Measurements made of the vapour pressure of mercury in a vacuum quartz mercury lamp while it was burning, showed that the vapour pressure was proportional to the terminal voltage, so long as the latter was kept above 60 volts, independently of current density.

A record taken with an oscillograph when the external resistance was suddenly changed, keeping the vapour pressure constant by immersing the lamp in water, showed constancy in terminal voltage, as though some current variation was found.

When, however, the same procedure was repeated with the lamp placed in air, the oscillographic record obtained showed gradual increase in voltage and gradual decrease in current with time, owing to the high temperature and consequent increase in the vapour pressure of the lamp.

On the Calculation of Total Radiation Resistance in a Short-Wave Directive Antenna

By Hikotarō Takeuchi

Total radiation resistance in a directive antenna is found by calculating the Poynting flux radiated from the antenna, while the radiated power due to mutual action of projector and reflector is also obtained by the same method. Using the value of the total radiation resistance thus obtained, the gains of a directive antenna in both front and rear directions are considered, and it is shown by graphs how the gains in each direction vary with the magnitudes of, and the phase between, the currents in the projector and reflector.

Experimental Study of Rock Drills

By Tomiji Suzuki

Upon comparing hand drilling with machine drilling, the writer found by the results obtained at the Hidachi Mine that the former method is superior to the latter, only in the case of soft rock. Judging from the general nature of rocks, he advances the opinion that drilling speed can be ascertained by the "rigidity test" and the amount of explosive required by the "Crater test", as devised by the writer, is made as follows :— a small hole 8 mm. diameter and 30 mm. deep is cut through vertically at the centre of a specimen of the rock into which a steel bar is inserted. A weight is then dropped on this bar. The height necessary for the falling weight to form a crater in the bottom of the specimen is measured. According to his experiment, the result of this test has a definite relation to the amount of explosive that will be required in actual practice.

The writer has examined the character and structure of 67 kinds of rock drills made both in Japan and abroad and estimated their comparative merits.

After laborious tests with various rock drills, he obtained the following results—The "feed clearance," i. e., the distance between the head of the piston of the Paynter's rock drill tester and the end of the bit is closely related to the length of the shank ; it is also intimately connected with the stroke of the piston hammer and general drilling efficiency. The writer also found that although some of the drills display full efficiency when the feed stroke is zero, most of them require a cer-

Digitized by Google

tain feed clearance, i. e., a feed clearance of 4-18 mm. for a heavy drifter and one of 2-10 mm. for a light drifter ; and that whatever the working pressure, the bit must be of the same weight as that of the hammer of the drill. The depth of the uneven surface of the bottom of the bore hole was also measured and the length of feed clearance required for it dtermined.

Experiments were made with drilling speeds to find the relation between the shape of the bit, the number of revolutions of the bit, the number of blows and drilling speed, rotation torque, etc. The author studied also the question of the oil in connection with the Paynter rock drill tester and offers suggestions as to its proper use.

Lastly he measured the strengths of the blows, the number of blows, output horse-power, drilling speed, the number of revolutions, air consumption, air indicated horse-power, compressor horse-power, efficiency by tester, distance drilled per air indicated horse-power, air used per 10 cm. of rock drilled, thermal efficiency, distance drilled per compressor horse-power, etc., in connection with 23 kinds of heavy drifters, 34 kinds of light drifters, and 10 kinds of stopers and summarized the results.

As to the relation between air pressure and strength of blow, number of blows, indicated horse-power, drilling speed, and air consumption, he finds them to agree on the whole with Seamon's conclusions.

In conclusion he suggests certain necessary conditions that should be fulfilled by a good drill from the maker's point of view.

On the Auxiliary Diesel Electric Propulsion of a Large Fishing Boat

By Ritsuichi Kokubo

The Government of Formosa has completed at Mitsubishi Dock Yard, a large fishing boat, equipped with two direct-reversible four-cycle Diesel engines, each developing 340 b.h.p. at 275 r.p.m. for main propulsion.

She is acommodated with many up-to-date fishing and propelling appliances, among which the most remarkable is the auxiliary Diesel electric propulsion. In case of tunny fishing with the line-hauler, it is most desirable to propel the boat at a very slow speed, nearly that of the winding of the line-hauler. Such a small number of propeller revolutions of as 11 r. p. m. is easily obtained by Diesel propulsion.

Another great advantage or convenience is that the captain himself can manœuvre the engine by remote control from the bridge, while he is at the same time inspecting the condition of the line, whether slack or tight, the most important part of his special fishing practice.

The electric propulsion is the Leonard system, in which the electric power is supplied from the auxiliary Diesel generator of variable voltage type to the variable speed 75 B.H.P. d. c. motor, which is connected to the shaft through reduction gears and a clutch. Two clutches are provided for one propeller shaft, one of which is engaged to the main engine and the other to the auxiliary propelling motor through reduction gearing. To avoid mishandling, when one of the clutches is engaged, another is disengaged by the same operating handle.

Model Experiments with the Special Sectional Form of a Submarine Hull under External Pressure

By Ariki Katayama

The results of model experiments

Digitized by Google

with a special sectional form of submarine hull under external pressure, as well as with the ordinary circular form are described.

The conclusions are: (1) The deflection of the special form is greater than that of the circular. (2) The buckling pressure of the shell plate of the special form is somewhat lowered by the excess compressive stress due to bending. (3) The position where the excess compressive stress occurs may be found by means of strength calculations. (4) If the special sectional form is to be adopted, it is recommended that the length of that special sectional part shall be kept as short as possible and, if practicable, the main bulkheads should be placed in such a position as will stiffen that part.

Fluctuations in the Light and Temperature of Vacuum Lamp Filaments due to Voltage Fluctuation

By Shigeo Suzuki

The author first deals with fluctuations in the light and in the temperature of a vacuum incandescent lamp when a periodic voltage is applied to the filament of the lamp in both stable and transient states. Secondly he discusses the temperature fluctuation of the same when the wave of the square of the applied voltage is in audible frequencies, giving an example of the application of this fluctuation to photophony. Lastly he describes the relation between the filament constants, as well as the amplitudes of the fluctuations of both temperature and light.

In an Appendix, the author describes also some examples of the wave form of temperature fluctuation of the filament in its stable state.

A Method for Automatic Telephone Exchange

By Takao Sajima

In the Strowger system, now in use, both the line finder and the selector must be provided with several relays, proper to each switch, in order to accomplish their functions, most of these relays being idle while the talking circuit is engaged. The author has devised a system of reducing a large number of relays and other devices, such as spark preventers, in the whole system by using a group of relays that are associated in a common control device instead of in many idle relays as in the Strowger system. Most of the parts of the mechanical system of the line finder and the selector are similar to those of the Strowger type switch, but a cam spring which is actuated as soon as the wiper shaft of the switch changes its motion from vertical steps to rotary, is provided for each switch to be ready for making the releasing circuit of each switch when the talking circuit is opened. Another feature of the system is that, for simplifying cabling between line finder and selector, the positive and negative lines are utilized for controlling the hunting motion of the line finder.

A New Mechanism for a Japanese Printing Telegraph Transmitter

By Kanji Shiraki

The author has devised a new mechanism in which the double current system is applied to the transmitter. Pushing a key-button turns the transmission distributor, selecting the corresponding mark, and directly dispatching six unit codes through the line. In this new device, in place of the old contact lever, are spacing contacts above the ton-

Digitized by Google

gue and marking contacts under it. The tongue is attached to the operating lever. Although its right part can move upwards, its left part is interrupted in its upward movement by a pin affixed to the operating lever. When the operating lever is pressed by the locking lever, the tongue touches the spacing contact by means of a spring on the right part of it, but when it is released, the tongue touches the marking contact. The transmission distributor, which consists of eight segments and a common ring, is installed on the main axis on which the contact cam was installed in the older type. When the printing is done, the brush comes upon a segment of the stop of the transmission distributor. By means of a projection attached to the main axis, the last-named stops its sliding motion after all the tongues on the spacing contact.

Measurement of the Height of the Kennelly-Heaviside Layer in Japan

By Tsutomu Minohara and Yoji Ito

It is well known that the height of the Kennelly-Heaviside layer varies according to time and place, in consequence of which, data obtained in Europe or in America might be of slight value in estimating the height in Japan. With this in view, the authors undertook to measure the height of the K-H layer. The method employed was that of Appleton, i.e., the frequency-change method, which was the one most adapted for our laboratory.

Upon measuring the height of the Kennelly-Heaviside layer by the frequency-change method for the Tokyo-to-Hiratuka transmission (distance 49 km.), the apparent height of the layer was found to range from 80 to 200 km.; being nearly 95 km. in the day-time and about 190 km. at night. But these results were obtained when the condition of the layer was comparatively steady. In the case of unstable conditions, there was abrupt change of height. But even with this considerable fluctuation, the height still remains within the range from about 80 km. to 200 km. It was observed both in the day-time and at night that a space-wave that has travelled more than two paths can reach the receiving station, as is clearly inferred from the existence of higher harmonics. The calculated values of the apparent height of the layer from the higher harmonics recorded in oscillograms are nearly all 150 km. in the day-time; and about 400 km. at night, when the condition of the layer is stable. It is difficult, however, to discuss from this experiment alone, whether this phenomenon is due to multi-reflection or to multi-refraction of the wave, or some other cause.

Infra-Red Communication by Means of Radiation Thermocouple

By Saburo Numakura and Hachiro Kojima

The light waves from a 50 watt automobile headlight lamp were transformed into parallel rays by lenses, and means of a Wratten filter No. 87, only those rays whose wave lengths were greater than 75 mu were transmitted. In the authors' experiments, the power consumption of the lamp was lowered to 3 watts, the infra-red rays falling on a tellurium-bismuth vacuum radiation thermocouple placed 5 metres away from the lamp.

The rays were interrupted either by a shutter or by hand, and after amplifying the intermittent thermo-

Digitized by Google

electromotive force induced in the thermocouple by means of a three stage vacuum tube direct current amplifier, the circuit of a 1000 cycle oscillator was made and broken by a specially designed electromagnetic relay, placed in the anode circuit of the last stage, the signals being detected with a telephone connected to the oscillator in series.

The relay consisted of a permanent magnet moving coil type pointer galvanometer and an auxiliary pointer moving freely on another axis. Each free end of these pointers has a contact point which is connected to the 1000 cycle oscillator in series, while, on another side of the auxiliary free pointer, is fixed a damping vane to make its motion dead beat.

Since the free pointer is surrounded by a small loop fixed to the free end of the galvanometer pointer, the distance between these contacts is always kept so small that the make and break is made instantaneously.

The difference in the anode currents of the last stage when the ray fell and when they were cut off was about 2 mA, while the displacement of the pointer was about 3 cm. A change of about 50μA in the anode currents was sufficient to operate the relay, so that several signals could be transmitted in one second.

On the Electrodes Used in Measuring Breakdown Voltages of Impregnated Papers

By Hideo Numakura and Shōzo Yoshida

The authors devised a process for preventing the brush discharges that occur at the edges of the electrodes when measuring the breakdown voltages of impregnating papers in layers.

As upper and bottom electrodes, solid cylinders of brass 40 mm. in diameter by 40 mm. high, were used, the edges of which were rounded with a radious of curvature of 10 mm.

Bakelite varnish was applied to and baked repeatedly on the rounded edges, by which means the field strength of the edges is greatly relaxed.

By using these electrodes an almost linear relation between the breakdown voltage and the number of layers is obtained, whilst in the case of electrodes without any bakelite varnish, the breakdown voltage per layer becomes lower as the number of layers is increased.

In both cases, the breakdown test was carried out in the same compound as that used for paper impregnation.

Many experimental curves are shown.

On the Result of a Propeller-Fan Test

By Noboru Inomata

In August, 1931, a propeller fan was erected on the surface of coal mine for the Navy, near Fukuoka.

The new fan was fitted with some discarded navy air-craft propellers, arranged tandem to the fan shaft.

The results of the tests may be summarized as follows:

(1) A constant relation exists between the diameter of the fan and the mine resistance in obtaining maximum mechanical efficiency; the best results being obtained when the ratio is about 2 : 1.

(2) Within a certain range, the number of revolutions has little influenced on the mechanical efficiency, although when it is too small, say 1 or 2 propellers, we find a drop in mechanical efficiency especially at low revolution.

(3) Volumetric efficiency increase

Digitized by Google

proportionally with equivalent orifice increase. The maximum mechanical efficiency is obtained, however, when it reaches 73%.

As for the air flow through the fan and evasee, four in efficient currents were observed, which could be greatly reduced with the aid of guide vanes and suitable contrivances.

With respect to these currents, the most interesting phenomenon is the air vortex induced by propeller rotation just before entering the first propeller, since it is closely connected with the equivalent orifice of the air passage.

This air vortex will be eliminated when the best ratio of the fan diameter to the equivalent orifice is attained.

Radio Research

On the Characteristics of Interference Surfaces of Electromagnetic

By Hideyuki Kikuchi

(1) A Group of Interference Surfaces of Electromagnetic Waves caused by the Presence of a Prolate Spheroid.

Let us assume prolate spheroid situated on the z-axis of an electromagnetic wave field that is propagating in the x direction, and polarized on the z-axis. The waves reradiated by this prolate spheroid are a train of confocal elliptic waves, polarized on the z-axis. Then the interference wave fields of maximum intensity by these two train of waves, one the reradiated elliptic waves and the other the coming plane waves, are a group of interference parabolic surfaces which deviate from ordinary parabolas.

(2) A Group of Interference Surfaces of Electromagnetic Waves caused by the Presence of a Kikuchi Electric Wave Lens.

A group of interference surfaces of electromagnetic waves caused by the presence of a Kikuchi electric wave lens is a group of enveloped surfaces consisting of many groups of interference surfaces caused by the presence of each prolate spheroidal element.

A New "Returning Type" Rotating Radio-Beacon

By Minoru Okada

(Electrotechnical Laboratory, Ministry of Communications Tokyo)

This paper describes experiments with a new type of rotating radio-beacon, having certain advantageous features that may be regarded as improvements on the one that is being used in England since many years past.

In our new system, the so-called figure-of-eight field pattern is made to rotate cyclically, turning back after each half revolution, thus enabling the bearing to be determined by observing the times of disappearance of the signal twice in one cycle. Moreover, instead of sending the signal wave continuously, we transmit 90 dots during the time that the direction of the minimum field intensity rotates 180°, i.e., 1 dot per 2°, so that instead of measuring the time, we can find the correct bearing at once by counting the number of dots from the "North-" or the "South-Signal" to the instant of disappearance of the signal.

Tests made with an experimental installation of our new system of beacons, constructed and set up at the Hiraiso Branch of the Electro-

Digitized by Google

technical Laboratory, Ministry of Communications, which works on 315 kc. modulated at 1,000 cycles, gave very satisfactory results as will presently be shown.

Some Studies on Thunderstorms

By Hisashi Noto

(Military Scientific Research Institute, Tokyo)

In Part I of the present paper, in which the change in the electric field during the passage of thunderstorms was investigated, it was shown that the changes in the steady field were so complex that no determination of the polarity could clearly be made. In Part II, in which the relation between the direction of travel of a thunderstorm and that of wind at various heights in the atmosphere was investigated, it was found that a thunderstorm is generally dragged down by winds existing at heights of 2,000 metres and higher above the ground. In Part III, the structure of thunderclouds is investigated. The inner structure of clouds is very complex, of irregular forms, consisting of many masses of clouds separated from one another by thin clouds. From observations of lightning flashes it was concluded that the conductivity of a dense cloud is greater than that of dry air in the laboratory. From laboratory results it is estimated that about 3,000 m. above the ground the effect of barometric pressure on lightning discharges decreases 30%. The space charge density and the voltage of a cloud element due to the charge on it were calculated by assuming a certain intensity for the field directly under thunderclouds, as the volume charge is believed to be intimately related to the propagation of lightning flashes. In Part IV, the amounts of various impurities contained in rainwater and in snow are investigated, the conclusion from which is that the amount of charge separated when a large drop breaks to pieces must diminish by 50%, in which case the "breaking drop" theory may be affected to some extent. Statistics of impurities contained in rainwater from 4 places in Japan for a period of six years are included in this paper.

Ionospheric Measurements at Losap Island During the Solar Eclipse of February 14, 1934

By Kenichi Maeda

(Electrotechnical Laboratory, Ministry of Communications, Tokyo)

The author describes and discusses the results of the measurements of apparent heights of the ionosphere by the pulse method carried out at Losap Island, one of the East Calorine Islands, during the solar eclipse of Feb. 14, 1934. It is found that the ultra-violet radiation from the sun is the prominent agent of the atmospheric ionization, and the effect of the neutral corpuscle from the sun is slightly observed and ends earlier on the F-layer than on the E-layer.

The results of the measurements of electron densities in the ionosphere and the noise level in the vicinity of Losap Island are also described briefly.

As an appendix the principal results of the ionospheric measurements in North America and Europe during the solar eclipse of Aug. 31, 1932, are tabulated and compared with the results of our experiments.

Ionosphere Heights Measured in the South Sea Islands and Radio Observations Made During the Solar Eclipse of February 14, 1934

By Tsutomu Minohara and Yōji Itō

(Naval Technical Research-Department, Tokyo)

Radio observations of the heights of the layers of the ionosphere were made by means of the pulse method at Losap Island in the South Seas during the period from February 1 to 17, 1934, especially on the day of the solar eclipse, February 14. On several days critical frequency measurements were also made.

We found considerable differences in the mode of wave propagation in the South Seas as compared with that in the Tokyo district and, as might be expected, the heights of the E-layer were somewhat lower in the South Seas than in Tokyo. The results obtained from critical frequency measurements enabled us to determine the existence of the echo region and the absorption region in the range of the middle and the short wave. In the course of our measurements, we came upon a special absorption phenomenon, which we have called the "noon phenomenon." The value of the ion density of the E-layer underwent marked changes with the progress of the eclipse. The states of the F-layer also changed and there was also anomalous rise in the layer heights. The effect of the neutral corpuscles on the ionosphere could not be observed as the frequencies employed were not quite suitable for observing the state of the E-layer at the calculated time of the corpuscular eclipse. Observationally, it did not affect the F-layer, the frequency having been merely for the observation of the F-layer.

A New System of Simultaneous Grid and Plate Modulation

By Tatuo Hayasi

(Department of Physics, Faculty of Science, Osaka Imperial University, Osaka)

In the conventional constant voltage modulation the grid of the amplifier tube is maintained at a negative potential by means of a bias battery or by a high resistance leak. The present method, however, makes use of the plate-cathode voltage drop of the modulator tube as the grid bias of the amplifier tube, resulting in grid modulation in addition to the normal plate modulation. This alternative circuit can easily be obtained by merely connecting the amplifier grid directly to the modulator cathode. After detailed explanations of the principle of this system, the results of practical experiments that were carried out on 7,100 kc. are described. So far as the degree of modulation is concerned this system gives very promising results. As there is almost no phase difference between grid modulation and plate modulation, distortion is not serious. The frequency characteristic moreover is better than in the Heising modulation system. Generally speaking, this new simultaneous modulation system seems to surpass both the conventional constant current and the constant voltage modulation systems.

On a New System of Receiving Set for Carrier Telegraphy

By Yasusi Watanabe, Zen-ichi Kamayachi and Kinshichi Kikuchi

(Tohoku Imperial University, Sendai).

This paper describes a new system of receiving set for carrier tele-

Digitized by Google

graphy. It consists of filters, selective amplifiers, and detectors. A new circuit of an ampli-filter of resonance current type is proposed here instead of the voltage type, while for amplifier a newly devised stabilized selective amplifier is used, the good points of which are constancy of amplification value as well as a high degree of selectivity.

For experimental verification of the foregoing, experiments were made with three channels of carrier frequency within audio-frequency range, such as 3,000, 3,300 and 3,360 cycles per second.

Television Transmitting Apparatus (100-Line Television)

By Kenjiro Takayanagi, Takashi Horii, Akira Yamashita and Kiyoshi Yamaguchi (Hamamatsu Higher Technical School, Shizuoka)

An experimental television transmitter is described. This equipment, which was installed at the Hamamatsu Technical College, was used in making practical tests of the system.

A Nipkow disc, with 100 holes arranged in a spiral, is directly coupled to the three-phase-induction-synchronous motor rotating at 20 revolutions per second. The picture, therefore, is transmitted at the rate of 20 per second, and has 1-to-1 ratio of vertical to horizontal dimensions. A light-spot system of scanning was used. The flash of reflected light is arranged to fall on the spherical photocells of caesium-oxide, vacuum type ; three tubes forming a pick-up unit.

The photo-electric signals derived from the cells have to be amplified approximately 10^5 times through an eight-stage capacity-coupled-resistance amplifier. The transmission requirements are that a frequency band extending from 20 cycles to 10^5 cycles shall be equally amplified. To compensate for the loss of higher frequencies, which may arise not only through stray capacities but also through scanning itself, the amplifier has a sufficiently low output resistance, while in some stages inductances are inserted in series with the low output resistances of the amplifier. The frequency characteristic is shown in the figure, the valves used being listed in the following table.

Stage	0	1	2	3	4	5	6	7	8	Modulator
Valves	Photocells	'57	'24	'24	'24	'24	'24	'2A5	'47 Parallel	203A×3

The picture transmitter utilizes a quartz crystal oscillator, driving power amplifier through frequency doublers and buffers. A carrier frequency of 7,200 kc. was used, the output of the power amplifier when measured being about 80-watts at normal operating conditions.

Modulation was made in the push-pull stage using a screen-grid valves (UV-814) preceding the power amplifier. By introducing a modulating signal in both screen-grid and plate circuit, the modulation characteristic was made practically linear. Owing to the requirement that the transmitter shall be capable of being modulated uniformly by frequencies from 20 cycles to 10^5 cycles, resistance was inserted in the plate circuit instead of modulation reactors. The circuit diagram is shown in the figure.

A Portable B-type Ultra-Short-Wave Telephone Set

Shōemon Ohtaka, Tarō Hasegawa, Kurō Matsuda and Kunio Maita (Yonezawa Higher Technical School)

This B-type circuit is a high frequency circuit devised by S. Ohtaka, one of the writers, in which the grid-side is not connected to the biasing source as usual, but is connected directly to the plate-side through a high resistance.

The writers arranged trial sets, using two UX 12A valves in push-pull. The high frequency circuit is never changed while working as transmitter or as receiver; its plate d.c. voltage alone being changed. It oscillates when raised and detects when lowered.

Using a 5.28 m. wave and about 0.3 watt antenna power, the writers were able to communicate over a distance of nearly 30 km. on land and 20 km. on sea.

The best results were obtained with horizontal antenna for land and with vertical antenna for sea.

On an Ultra-Short-Wave Wavemeter

Hikosaburō Ataka (Meidi College of Technology, Tobata)

In the practical construction of an ultra-short-wave wavemeter for wavelengths less than three metres, there arises the following difficulty: Owing to the deleterious inductance of the lead wires that connect the condenser in the shielded case with the outer coil, the dimension of the coil become too small to measure the shorter wavelengths.

The writer has developed a wavemeter with an auxiliary coil. The principal coil of the tuning circuit of the wavemeter is connected close to the terminals of the condenser in the shielded case, while an auxiliary coil of relatively large dimensions is placed outside the case. These two systems are connected with lead wires. A resonance indicator of high impedance is inserted between the terminals of the condenser. The auxiliary coil and the lead wires therefore serve merely to introduce the induced e.m.f. into the tuning circuit, which can be constructed to resonate for wavelength less than one metre.

On the Equipments for International Radio Telephone Communication in Japan

By Toyokiti Nakagami (International Wireless Telephone Co. of Japan, Tokyo)

The conditions for selecting the sites of the sending and receiving stations are enumerated, after consideration of which it was finally decided that the sending and receiving stations be situated at Nazaki, Ibaraki profecture, about 80 km. northeast of Tokyo and at Komuro, Saitama prefecture, about 40 km. north of Tokyo.

Five crystal controlled valve transmitters are installed together with the beam antennas for telephone communications with America, Europe, South Sea Islands, Manchoukuo, and Formosa.

The design, construction and performance of the transmitters and antennas are described in detail.

Five superheterodyne receivers are installed at the Komuro receiving station, whose design, installation, and performance are also described in detail.

The antenna system installed at the receiving stations is also described, together with the performance characteristices.

Digitized by Google

These stations are connected by cable with the Tokyo Central Telephone Office, where the Vodas equipment is installed for the purpose of connecting four wires to two wires of any subscriber.

The construction and performance of the cable are described.

The result of the field intensity measurements of the stations with which we communicate is also given.

Physics

Crack and Life

By Torahiko Terada

In the domain of physical phenomena there are a number of different classes of morphological changes which may be compared with crack formation in solid body when regarded from the point of view based on the consideration of surface energy distribution, i.e., phenomena connected with colloids, crystallization, etc. From the same point of view, some elementary biological phenomena such as mitosis and cell division may also be regarded as a kind of crack formation and the growth and differentiation of organism seems to be connected with the multiplication of the seats of surface energy. On the other hand, some discontinuous phenomena similar to crack formation seem to be of important significance in different stages of embryonic development. For example, the irregular colour patches on the skin of some domestic animals suggest that their formation may be related with a kind of crack formation in some period of the embryonic growth. This suggestion is supported in some degree by the fact that in an example of cat the coloured area when cut out and put together in juxtaposition, forms a more or less simple, say pear-shaped closed surface and, moreover, that the boundary lines of these patches thus put together show characteristic forms proper to the cracks produced on a spherical shell exploded by pressure.

Experimental Studies on Colloid Nature of Chinese Black Ink

By Torahiko Terada, Ryuzō Yamamoto and Teru Watanabe

Chinese ink in popular use in Japan from ancient time is obtained by rubbing a piece of dry water-colour called sumi, which is made by a mixture of lampblack with glue, upon the surface of a stone vessel called suzuri, filled with water. Preliminary studies of different colloidal properties of the ink are made. The average diameter of the colloid particles are estimated. Thickness of the film formed by spreading the ink upon water surface is estimated under some assumption and found to be of monomolecular size. Solidification of this liquid film by the action of electrolytes is detected and investigated by the change in form of the perforation produced by touching the film with a needle point tarnished with greasy matter. Solidification is also observed when the film is longitudinally compressed above a critical degree which is also affected by the electrolytes. The change is reversible and the solidified film is again liquefied when it is expanded to its original area. Various forms of perforation may be obtained by touching the film with a wooden tip in which the film producing materials are irregularly distributed.

Piano Touch and Tone Measured through the Application of Recorded Sounds in Talky Film

By Ryūzaburō Taguti and Seiiti Watanabé,

(The Institute of Physical and Chemical Research)

For the past several years, we have been making accurate studies or measurements of various accoustics and phonetics through applied talky films, and publishing the results of these researches in Japanese in Tokyo since 1933. Recently we made studies on the sounds of piano and found out that there are two kinds of wave: they are transient and continuous waves.

The former, in case of piano, is a sound wave produced at the very moment the cord is touched with a hammer as well as the consonant of human sound which does not absolutely contain the vowel sounds, and does not raise any accoustic sense by itself.

We have discovered that, when the continuous wave follows up to this transient wave within 0.3 seconds, the sound of continuous waves makes an altered sound. For instance, of the waves "k" and "a" are arranged according to this law, the sound "ka" can be heard. In this way, we are able to pick up two waves, arrange the sounds artificially, and also rotate the films conversely.

Accordingly, we made a talky film of a famous Japanese ode which was sung into conversely, this was so cleverly and clearly done that no one can notice the film being rotated in a converse way.

It is very interesting to hear the musical film of piano or Japanese samisen when being rotated in opposite way.

Again, if the wave "y" is painted off from the wave "dya" recorded in sound track, the voice "da" is clearly heard. These techniques are valuable for analyzing all kinds of sound, and we have succeeded in determining the nature of the transient wave to a considerable extent.

In case of piano we have made another experiment aside from the one already cited. In order to record the time of the touch, we stained a line close to sound track by means of a glow lamp. Through the length of this line, a time to 1/1,000 second can be easily measured.

It has been discovered through the help of this line that the sound of piano begins to be produced 1/60 second after the finger touches the key. In the beginning, the transient wave is produced. When a long trailing note follows this transient wave, wthout the use of the damper, we can identify the piano by the note, or can even point out the name of the makers. In other words, the transient waves have a specific property to enable us to know the materials of which the piano is made. Such specific property manifests itself more clearly when the trailing note of the continuous waves are longer.

In the event of sounds such as cited above, pianists, no matter what a magic power his fingers may have, he cannot produce sounds other than those sounds which the makers of that piano intended to produce.

Again, the hammer of piano, at the moment it strikes the cord, keeps up contact with the cord just for the period the cord makes one cycle with its natural period. At the side to the right of C key in the centre, it keeps up the contact for more than one cycle. For that reason, points on each cord to be struck by a hammer must, of necessity, be placed near the end of the cord according as the pitch

Digitized by Google

of the sound becomes higher. If the physical meaning of this striking point is taken as a collision between the two, it will apply to matters having a high rate of elastic property. The speed with which the hammer returns from the cord is considerably high. It has become clear that the formula of motion of the hammer is nearly the same as a parabollic equation.

The most important problem for piano is the problem of staccato. When a pianist takes off his fingers after the hammer makes the performance of striking the cord abovementioned, the damper comes out and stops the motion by holding down the cord. But since the soundwave of the piano gradually dies out within about 0.3 second the wave form of the sound is different from the wave form which was produced before the damper was set in. Moreover, these two kinds of sound waves are of different sorts. In case the touch runs from 0.1 to 0.3 second the sound waves of these two kinds reach to ears together with a certain energy, so that the waves are heard flat sound. When the touch runs shorter than 0.1 second the greater part of sound wave heard is that produced after the damper comes to hold the cord, and the sound wave produced before that, due to the fact that the time during which the sound is heard being too short, acts like the consonant of the sound wave produced after the damper catches the cord, and sends rather clear sound to the ear. Most of touches of poor pianists, being mostly longer than 0.1 second, cannot produce clear sound.

For the strong touches with straightened fingers, the speed of the damper at the moment the fingers leave the key being faster than in the case where the weaker touches are made with fingers by bending them, the sound produced by the damper when the latter holds the cord, is irritant to the ears. All of these prove that the tone of the sound produced by the piano is controlled only by one function of length of time. This makes the piano distinctively different from other musical instruments.

When a fine music is played with a piano, the volume of sound is produced with an additional factor of the angular velocity of the hammer. To this tempo is added and a finished music is reproduced.

We also had an occasion to measure this tempo from a play of a famous Japanese pianist, Mr. Motosige Iguti. In spite of his beautiful musical scale the time which each of his fingers took differed to a considerable extent, namely the difference in time when the musical scale was lowered with the right hand was as follows :

1. The time consumed when the third finger was shifted to the second finger 0.06 sec.
2. The time consumed when the second finger was shifted to the first finger 0.08 sec.
3. The time consumed when the fourth finger was shifted to the third finger 0.085 sec.
4. The time consumed when the first finger was shifted to the third finger 0.086 sec.
5. The time consumed when the fifth finger was shifted to the fourth finger 0.09 sec.

When the musical scale was raised,

1. The time consumed when the third finger was shifted to the fourth finger 0.06 sec.
2. The time consumed when the second finger was shifted to the third finger 0.07 sec.
3. The time consumed when the fourth finger was shifted to the fifth finger 0.08 sec.

Digitized by Google

4. The time consumed when the third finger was shifted to the first finger 0.09 sec.

5. The time consumed when the first finger was shifted to the second finger 0.093 sec.

6. The time consumed when the fourth finger was shifted to the first finger 0.125 sec

were shown. Probably the music was not played under the best condition of Mr. Iguti. In spite of the variation in time, the music was satisfactory to the keenest of ears, which appeared rather peculiar. From this, it is apparent that if poor pianists play music, which is offensive to the ear, the variation in time would be unspeakably great. As the result of the above measurements, the objection was raised against us by many pianists who consider that the quality of sound depends on the manner of touch. Even much stronger objection was raised by critics of music against the theory that the quality of sound can be determined by scientific measurements. However, the fact is the same as in the instance when Galileo said: "The earth moves, though."

On the Change of Properties of Die Steels due to the Heat Treatments

By Takejiro Murakami and Atsuyoshi Hatta

The change of the transformation points of six commercial die steels, i. e., 1 non-alloying high carbon steel, 1 low chromium-high carbon steel, 3 high chromium high carbon steels, and 1 tungsten-chromium steel, has been studied by means of the magnetic analysis and differential dilatometric measurement. The measurements were made on the hardness and the abrasion loss of these steels after several heat treatments under the room temperature, and the impact hardness and the impact value at the high temperature; the microstructure of these steels has also been examined. With both the high carbon steel and the low chromium-high carbon steel, the change of transformation points due to the cooling rate or the maximum heating temperature is not so marked, while with the high chromium-high carbon steels and the tungsten-chromium steel, the change is conspicuous. The difference of the hardness among these steels in their furnace-cooled condition is slight, but that of the air-cooled state is great, according to the composition of the specimen and the maximum heating temperature. The high chromium-high carbon steels and the tungsten-chromium steel are readily hardened by aircooling from above 900°. The high chromium-high carbon steels are markedly hardened after oil-quenched and the maximum hardness can be obtained by quenching from 1000°. The hardness of the high carbon steel after oil-quenched is less than that of the other steels. With the low chromium-high carbon steel and the tungsten-chromium steel, the hardness markedly decreases as the quenching temperature rises from 900° to 1100°, owing to the increase of the residual austenite. These steels with the low hardness value show marked increase of hardness, i. e., "the secondary hardening" on tempering. The same phenomenon is observable in the high chromium-high carbon steels which are oil-quenched from 1150°. The values of the hardness measured at several high temperatures and those at the room temperature after being cooled from these temperatures, respectively, show a parallelism. The abrasion loss is small with the specimens having the large

Digitized by Google

value of hardness. The impact value of these steels tested is generally small, especially with those of the oil-quenched, nevertheless it increases as the testing temperature rises.

On the Adsorption of Water Vapour by Magnesium Oxide

By Fusao Ishikawa and Kokichi Sano

From the results of the present investigation we have found that magnesium oxide first adsorbs aqueous vapour, and that the adsorption equilibrium is attained before the hydration of the oxide, the latter process proceeding quite slowly as compared with the adsorption process. The velocial of the adsorption of the aqueous vapour in air by magnesium oxide has also been investigated. The adsorption isotherm has been studied at 51°, the result of which may be represented by Freundlich's formula. Finally, the relation between adsorbed quantity, pressure and temperature has been studied, and the linearity between $\log P/aT$ and $1/T$ has been established in the temperature range of 9-42°.

Valence-Theoretic Calculation of Energy of Aromatic Compounds

By Hidehiko Tamaki

The combining energy of simple molecular models of ring compounds was calculated with Heitler-Weyl-Rumer's spin valence theory. The coefficient of Austauschintegral, which mainly determines the combining energy, was found for each model and divided by the number of atoms composing the molecule, in order to compare the stability among the considered molecules. Against expectation, hexagonal ring of trivalent CH-radicals (benzene) was found to be a little less stable than pair-shaped one (acethylene). It suggests that the spherical asymmetry of the atoms and their combining force, which is neglected in the spin valence theory, should be taken into account (as is done by the theory of orbital valency).

The X-Ray Examination of Selenium Crystals

By Kenzo Tanaka

Several forms of metallic selenium crystals obtained by the condensation of selenium vapour were examined by means of X-rays. The crystal of metalic selenium grows most prominently in its trigonal axis. This growth process of the selenium crystal is interpreted from the standpoint of the growth of homopolar crystals.

The degree of perfection and size of the grain of selenium crystals were estimated from the fine structure of the spectral lines obtained with convergent X-rays. The intensity distribution along the spectral line was interpreted from the intensity distribution of the primary X-rays at various starting points on the surface of the anticathode.

The transition point from the vitreous to the metallic form was determined both by X-ray examination and by measurement of the net densities.

An Investigation of Various Forms of Carbon by means of Cathode Ray Diffraction

By Mitsuwo Miwa

Improving the method of cathode ray diffraction for powered sub-

Digitized by Google

stances, the various forms of carbon were studied. Most of the results obtained were found to be in good agreement with those by X-rays. The so-called amorphous carbon is merely a very fine form of graphite, and the lattice of graphite greatly expands in the direction of the principal axis, as the grain size diminishes, whereas the crystal lattice remains nearly unchanged in the directions perpendicular to the axis. Some characteristic results caused by the nature of cathode rays were obtained.

The magnetic susceptibility of the samples subjected to the cathode ray investigation was measured, and its relation to the grain size was also studied, finding that the magnetic susceptibility is nearly proportional to the grain size in the range of amorphous carbon.

Further Investigation of the Crystalline Structure of Electrolytic White Tin

By Hideki Hirata and Yoshio Tanaka

The arrangements of the microcrystals in electrolytic specimens of white tin, deposited from sulphuric acid solutions were examined with X-rays by the same procedure as in the foregoing investigation, which dealt mainly with those deposited from hydrochloric acid solutions. From the diffraction patterns obtained, it was found that the microcrystals of white tin have a tendency to be electrolytically deposited with the normals to their (111) faces arranged parallel to a definite common direction, as was the case in our previous research. But in some other respects, especially with regard to the direction of the growth of the deposited white tin, a few dissimilarities were observed from the results of the former experiments. The cause of such dissimilarities was supposed probably to be due to the difference in the chemical valencies of the ions in the electrolyte.

Some Experiment on Lichtenberge Discharge

By Tatsumi Terada

(1) The size of discharge-figures alter with the varying positions of a resistance which is inserted in series with the lead to the electrode. This phenomenon seems to be due to the superposition of not only an advancing wave but also of the waves reflected at some junctions in the circuit. From the experimental results, it is found that the time of the impulse wave-front in our case is about 2.3×10^{-8} secs. Some other experiments on the Lichtenberge discharge are also described. (2) The effect of self-induction upon Pedersen's short time-measurement is described and it is shown that by this method (under certain conditions) small inductions from about 0.7 to 40 microhenries can be measured. (3) A method for measuring a short time interval by using a low pressure tube is suggested.

The Change of Magnetic Susceptibility in Metals and Alloys Caused by Internal Stress

By Yosomatsu Shimizu

Notwithstanding many investigations hitherto made, the effect of internal stress or cold-working on the susceptibility of metals and alloys has not yet been completely solved. The present investigation was undertaken to obtain a further knowledge on the same subject, and the following results were obtained :— With an increasing degree

Digitized by Google

of internal stress, the paramagnetic susceptibility of metals and alloys decreases, while their diamagnetic susceptibility numerically increase. In the case of an alloy of gold with platinum, its susceptibility is changed by cold-working from paramagnetic to diamagnetic. Further, a theory is proposed, by which the experimental results obtained can be satisfactorily explained in a quantitative way.

Messung der Helligkeit der Korperfarbe

By Masaaki Yazima and Hisakichi Kanazawa

Der Finfluss von Helligkeit über die günstige Belecuchtung der Gemälde ist eine wichtige Frage. Es ist sehr zu erwünschen, die Beziehung zwischen der Helligkeit und der Beleuchtung der bunten Gemälde zu finden. Aber leider man hat bis jetzt keinen diesbezüglicher Versuche wahrscheinlich durch die Schwierigkeiten der Untersuchung. Als die erste Annährung der Lösung dieser wichtigen Frage, wollten wir in vorliegenden Arbeit, nicht die schwierigen Helligkeits-messungen von der bunten Gemälde, sondern die Messung von der Farbpapiere, durchführen. 16 Probepapiere waren untersucht, die mit den üblich von japanischen mineralischen Pigmenten, gleichmässig gestricht wurden. Wir haben drei Methode zur Messung der Helligkeit der Farbpapiere. (i) Die Methode nach der Augenmass. (ii) Vergleichsmethode: Methode mit den Stufenphotometer ohne Filter. (iii) Cstwald'sche Methode.

Die Schlussfolgerungen sind: (i) Diese drei Methoden stimmen beinahe in der Ergebnissen ein, besonders in der ersten und der dritten Methode. (ii) Die Helligkeiten der Pigmente und wahrscheinlich die von der Gemälde, sich nach der Ostwald'schen Methode zahlenmässig darstellen lassen. (iii) Die Anordnung der Pigmente nach dem rein psyologische Farbsinn wie in der ersten Methode trozdem seinen Einfachheit ziemlich glaubwürdig ist.

Medicine

Influence of Air Ion on Living Bodies

Ishidate and Sanshi Abe

(Hygiene Class Room, Department of Medicine, Hokkaido Imperial University)

Introduction

There has been many changes of theory on the idea of the qualities of air. At present, it is generally understood that the qualities of air depend principally upon the effective temperature or cooling power which are obtained from the various combinations of physical factors of air, such as temperature, humidity and wind velocity.

In recent years, however, aside from these physical factors, ionization of air was suggested and the effect of air ion upon the human bodies was recognized. Since we devised and made an equipment of measurement in 1932, we examined the ionic content of room and outdoor air. We also ionized the air by an ion-producing apparatus artificially, and have made various physiological experiments. A summary report follows:

Atmospheric Ion

In the previous report, we reported that changes in ionic condition of the air have the most close relation with the direction of winds among various

Digitized by Google

meteorological factors. To be exact, the ratio of the number of negative and positive ions N+/N− (We call this the ion ratio for convenience) varies according to the changes of the direction of winds. According to the results obtained in various places in Hokkaido, the number of positive ions is always larger than that of negative ions when the wind blows to the south-east or to the east, so that the expression would be $N+/N>1$. On the contrary, when the wind blows to the west, or to the north-west, the number of negative ions was greater than that of positive ions, which is to be expressed by $N+/N<1$. In Tohoku and Hokkaido districts, the east and east-south winds are called "Yamasekaze", and there is a well known fact that when these winds blow some people feel discomfort, or headache, while others feel that their rheumatism painful. From these facts, it is suggested that aside from various meteorological factors, such as temperature, humidity, wind velocity, quantities of rainfall and sunshine, the atmospheric ion, especially the ion ratio N+/N− has a very intimate relation with our comfort degree. Then we examined about four men to see the relationship between the ionic condition of air and blood pressure, pulsation, respiration, body temperature, feelings, etc. for full one year. From this, we recognized the fact that the ionic conditions of air have relations to these physiological actions.

Physiological Experiments

In order to study the effect of atmospheric ion on the living body, we devised an equipment, in which either only positive or negative ion may be collected at one pole, or the mixture of both ions may be produced at convenience. Ordinary air contains about 10^3—8×10^4 unit of light or heavy ion in its one c.c. In our experiment, we ionized the room air to the concentration of 5—9×10^5 per 1 c.c. and experiments such as mentioned below were performed:

(1) Experiment on the Human Body

According to the experiments made on 108 people, both healthy and feeble-bodied, the positive ion acts themselves on the whole, and though there are some exceptions, it causes sleeplessness, headache, or other disagreeable feelings. On the contrary, the negative ion acts like a sedative, and when they are bathed in the negatively ionized air, there appears a stimulating action in the beginning of bathing, but soon the sedative action appears following,—sleepiness, quieting down of coughing, restoring effect of pain, curing of itchiness, prevention of sweating, improvements in appetite, lowering of blood pressure, diuresis, etc. These phenomena did not appear so markedly in healthy people, but they were very clearly produced in the feeble-bodied. In order to find out how these phenomena were produced, or to determine the functional action which produces such phenomena, following experiments were carried:

(2) Action on Blood

In general, when a liquid like salt water or solution of serum is placed in the ionized air positively or negatively, a change would be produced in the hydrogen ion concentration of the liquid, and it was recognized that there is a tendency to make either acidic or alkaline. Then we examined a rabbit exposing in the ionized air. We recognized the fact that when the animal was exposed in the ionized air positively charged, the blood showed a tendency to be acidosis,

Digitized by Google

while in the case of negative ion, the blood showed a tendency to be alkalosis. And, it is well known that if there occurs any changes in the hydrogen ion concentration of the blood, it causes various changes in the many functions of the whole body.

(3) Action on Growth

A group of young guineapigs were exposed in the ionized air every day, and its growth were carefully observed. Generally, the animals which were exposed in the negatively ionized air lost their weight markedly in the first few days of experiment, but soon recovered its growth and well developed. On the other hand, when the animals were exposed in the positively ionized air, the loss of weight was not so obvious in the beginning of experiment, but thereafter the increases of body weight were comparatively small. Differences in the growth of animals under two conditions appeared to be clearly noticeable.

(4) Action on Blood Vessels

It appears that, why the change is produced in the blood pressure by the air ion is not yet well understood. At present, it is a well known fact that as regards the blood pressure, a great importance is placed on the contraction and expansion of the minute arteries in the whole body, aside from the effect produced by the function of the heart. We, therefore, made an experiment on the blood vessel of a membrance of the web-foot of a frog. According to this experiment, the negative ion appears to have effects in expanding capillaries, while the positive ion contracts them. Therefore, the effect upon the blood pressure due to the ion of air appears to be on the expansion and contraction of the minute arteries and capillaries, apart from the action produced by the function of the heart.

(5) Experiment on Specimen of Nervous Sinew

A specimen of sinew of a frog was prepared, and a curve of regular fatigue was drawn. When the height of contraction of sinew became small, and the air of that part was ionized into the negative ion, then the sinew contraction, though small in degree, became larger again according to the concentration of the ion, which indicated in some instances the phenomena of recovery from fatigue. But when the air was ionized into the positive ion, the phenomenon was not so clearly noticeable. In the experiments which were performed on specimen of nervous sinew, the action of the ion was more clearly produced, which showed that the ion acts more keenly on the nerve than on the sinew.

(6) Application to Fatigue of Operatives in Mills

Negatively ionized bathing was tried to scores of operatives who were suffering from sleeplessness, headache, fatigue, etc. which appeared to have been caused by overworks. Though there were some exceptions in which the curing effects could not be clearly noticeable, these symptoms either disappeared completely or showed great improvements in majority of cases.

Conclusion

From our experiments on the relations between the air ion and living bodies, we have learned that the air ion is one of important factors which has much effect on living bodies in the air, apart from the several physical factors such as temperature, humidity, wind velocity, and sunshine, which have been thought in the past as important. We believe that further research will have to be done for the various branches of hygiene.

CHAPTER XXXIV

PRESS AND PUBLICATIONS

Press

Early History

Yomiuri Even in Old Japan some form of public announcement was issued from time to time, like the Acta Diurna of the era of the Roman Empire, but perhaps the present subject may appropriately be begun with the Yomiuri, the oldest semblance of the newspaper, which name can be literally translated "reading aloud and selling." The Yomiuri sheets were so named because the venders read aloud the contents of the newspaper on the street while soliciting buyers. The Yomiuri sheets were essentially the Flugblatt of the Middle Ages of Europe. They consisted of single printed sheets, or pamphlets of several pages, recording the latest events of the period. Even in those days the progress of wood-block prints permitted the appearance of illustrations in the sheets. In many cases the illustrations were the outstanding feature, and the descriptive matter was of secondary importance. In this respect the Yomiuri differed from the Flugblatt of Europe.

Its Publishers Old records are lacking to identify the publishers of the Yomiuri, but it appears that the publishers of newspapers, or rather equivalents to newspapers, in the earlier part of the Tokugawa period (about 250 years before the Restoration of Meiji, 1868) were men of little fame and honour. Even at the end of the Tokugawa period it appears that the publishers of the Yomiuri were men of so lowly positions that they were not permitted to enter the society of even wood-block printers. It is, however, considered likely that this early form of the newspaper failed to make any progress owing to government pressure. The Yomiuri carried contents that were often inflammatory and distasteful to the government. Suspension of publication was ordered so frequently that no decent publishers dared to take it up as an enterprise. Only men of low repute engaged in the business often against the law.

Printing of the Yomiuri sheets was done by wood-block prints. The contents of the Yomiuri sheets can generally be divided into two, prose and poetry. This distinction, it appears, existed from the early part of the Tokugawa period. In the era of Genroku (1688-1703) the hawkers sold their sheets on the street either calling the attention of prospective buyers by singing, with or without the accompaniment of the samisen, or merely reading aloud the contents. At the end of the Tokugawa period sheets were sold with the sellers singing popular ballads.

Its Contents A perusal of those Yomiuri sheets still extant shows that at the outset of the development the chief interest of the sheets lay in the illustrations. What are believed to be the oldest Yomiuri have illustrations of the Battle of the Osaka Natsu-no-jin in May in the first year of the era of Genna (1615), accompanied by descriptive matter. Judging from the frequent

Digitized by Google

issuance of suppression or suspension orders, Yomiuri sheets appear to have been published and sold in abundance during the eras of Empo (1673-80), Teikyo (1684-87) and Genroku (1688-1703). In Western Japan, with Osaka as the centre, there is evidence of the popularity of erotic contents in Yomiuri sheets, featuring such stuff as stories of double suicides. Since the vendetta of the famous Forty-seven Ronin vendetta stories formed the chief subject of interest and after the era of Genroku subjects of natural calamities were featured. In the eras of Bunkwa (1804-17) and Bunsei (1818-29) the enforcement of justice and morality undertaken by the Shogunate government, stressing the protection of right and chastisement of wrong, was reflected in the stories featured in the Yomiuri sheets of those days, even in the accounts of natural calamities and those of sex relations. Because the stories were written by men of low repute, the contents of the Yomiuri sheets in many cases were repellent in tone. Immediately before and after the Restoration of Meiji accounts of the civil disturbances were written, but by this time the number of Yomiuri sheets had considerably decreased owing to the appearance of newspapers in the more correct sense of the term.

Fusetsugaki Another equivalent of the modern newspaper, in addition to the Yomiuri, was a periodical named "Fusetsugaki" or Book of Reports, which carried foreign intelligence. These books were of two kinds, one with Dutch and one with Chinese reports. After the third Tokugawa Shogun adopted the policy of seclusion, it was only China and the Netherlands which had intercourse with Japan. Captain "Yanyos" (Jan Josten) of Holland, after Japan's adoption of the seclusion policy, presented annually a book descriptive of foreign affairs to the Shogunate government. It was the Oranda Fusetsugaki, or Book of Dutch Reports. The Chinese government in those days presented to the Shogunate government of Japan Chinese intelligence after the manner of the Dutchmen. Information obtained thus was placed in the hands of the Prime Minister and kept confidential, but after the American "black ships" came to knock at the door of Japan, permission was granted to make copies of those books for public circulation. The presentation of Dutch documents continued until the era of Ansei (1854-59), but as the country was opened to foreign intercourse this custom was discontinued at the request of the Dutch government, which instead of the customary annual volume presented Dutch newspapers to the Japanese government. It is considered certain that the newspapers thus presented to Japan were copies of the Javasche Courant, organ of the Government of Batavia.

Precursor of Modern Paper When the provincial clans requested that the Dutch Book of Reports be made public, the Shogunate government's Yosho Shirabesho, or Bureau for the Study of Western Learning, agreed and planned to publish it. This plan did not materialize, as the Dutch government then replaced the book with newspapers, but instead, the bureau translated the newspapers into Japanese and published them for general circulation. This was the precursor of the modern newspaper in Japan. Not content with this Dutch newspaper, the Shogunate government continued to translate and publish other newspapers from Holland and imported Chinese-language newspapers published by white Christian evangelists in Hong-Kong, Shanghai and other places, and had

Digitized by Google

them not only translated and annotated but printed and bound into books and entrusted Hyoshiro Yorodzuya, a book purveyor to the Shogunate government, with the public sale of these books. In general printing wooden types were used. For printing these Chinese newspapers imposition was adopted and for this purpose the Shogunate government had to establish a special department for type foundry. This enterprise was a reflection of the out-and-out principle the Shogunate government adopted for opening the country to foreign intercourse. Those books were chiefly published during the era of Bunkyu (1861-63). Hence they were popularly called Bunkyu Shimbun (newspaper).

Papers in Yokohama In the meantime, anti-foreign sentiment was gaining force in this country and after the era of Bunkyu this interfered with the translation and publication of foreign newspapers. Foreign residents of Yokohama, however, translated and published foreign-language newspapers in Japanese and they were patronized by those who favoured opening the country to foreign intercourse. Men on the staff of the Bureau for the Study of Foreign Learning had an eye on foreign affairs and established a new institution for the purpose of translating into Japanese articles dealing with Japan which were printed in the English-language newspapers in Yokohama, such as the Japan Commercial News and Japan Times. Those translations were not printed but written by scribes and circulated among interested persons. The years during which this was done extended from 1863 to 1865. Foreign residents of Yokohama also published three Japanese-language newspapers, Kaigai Shimbun (Foreign Newspaper), Bankoku Shimbun (International Newspaper) and Rondon Shimbun (London Newspaper). Of these three, the Bankoku Shimbun had in its contents not only foreign intelligence but news of Yokohama and comment on the English-language newspapers of Yokohama; it introduced ideas of British civilization and carried many advertisements. This journal was edited ably in a characteristic style and published monthly. From this time general progress in newspaper-making was noticeable.

Foreign Language Papers The first foreign-language newspaper published in Japan was the Nagasaki Shipping List and Advertiser issued for the first time in the year 1861 by a resident Britisher, Mr. Hanseard. It was a weekly. The publisher soon moved to Yokohama, where he continued his publication under the name of The Japan Herald, the first issue of which was brought out in December of the same year. He employed Mr. Black, another Britisher, then a resident of the port city, as editor-in-chief. The example set by the Japan Herald was soon followed by the appearance of the Japan Commercial News in 1863, a weekly published by a Portuguese. In October of the same year the Japan Herald, in addition to the weekly, started a daily newspaper which featured advertisements. In the year 1865 the Commercial News was discontinued and Mr. Rickerby, a banker, bought the newspaper equipment and started the Japan Times in September of the year. In 1867 Mr. Black had a dispute with the new owner of the Japan Herald, and, leaving the paper, he issued the Japan Gazette, an evening paper. The popularity of the Japan Gazette overwhelmed the Japan Times and the latter lost much patronage and finally had to discontinue publication. The disappearance of the Japan

Digitized by Google

Times, however, was followed by the launching of the Japan Mail. In addition to these newspapers, there was another English-language newspaper, having the name of the Japan Express, published by an American, whose first issue appeared in 1866. The copies of this newspaper were hand-written, carved in wood blocks, and printed. While the name of the publisher and the period of publication are unknown, it is recorded in a diplomatic document in the possession of the French government that this journal represented the American interests. In addition to these papers, there were also a French newspaper, L'Echo du Japon, in the era of Keio (1865-7), an English magazine of caricature, the Japan Punch, which was published continuously for 20 years from the era of Bunkyu (1861-3), and a French magazine of caricature entitled Tobayé. These publications stimulated directly or indirectly the birth of the Japanese modern newspapers.

The Restoration Demand for foreign intelligence was the principal factor in the birth of newspapers in the East as in the West. In Japan, too, newspapers of the earlier periods carried much foreign news, but when there were big developments like civil disturbances they played up internal affairs. The Restoration of Meiji in 1868 afforded the press of Japan much scope for development. Newspaper editors in Yedo, the present Tokyo, were excellent scholars and their papers were much superior to those edited in the provinces. One of the papers in Yedo already advocated parliamentary politics as early as this period. Newspapers published by those holding the "Emperor-centric" policy were filled with articles which merely reflected on the intelligence of the editors themselves. They only advocated the "Emperor-centric" policy and did not propose any advanced ideas about reforms. Newspapers affiliated with the Shogunate government enjoyed much larger circulation than their competitors and it is stated that one of them had a circulation of 3,000.

The Press Law

The press law in Japan was enforced by the Government for the first time in February, 1869. This was the signal for several new newspapers to spring up. The Government, however, interfered so much with the press that sales of newspapers were much hindered and the healthy progress of the press was checked. While the business side of the press was dull, editing itself attained notable progress. Political news had become unusually constructive and efforts were made to establish a new civilization and propagate new and advanced ideas among the people.

Modern Papers

The Yokohama Mainichi The first true Japanese daily newspaper appeared in December, 1870, with the publication of the Yokohama Mainichi Shimbun. Not only was this newspaper a daily but it consisted of a single foreign-style paper sheet with printing done with lead types. In outside appearance it had the semblance of the modern newspaper. Although its contents were much inferior to those of the newspapers that were founded later in Tokyo, it resembled English-language newspapers in that it carried many advertisements.

More Papers Born The year 1872 saw several more dailies born, newspapers which were more perfect in appearance and reading matter than their predecessors. Those newspapers included the Tokyo Nichi Nichi Shimbun, Yubin Hochi Shimbun, and

Digitized by Google

the Nisshin Shinjishi, the last being edited under the supervision of Mr. Black, formerly editor of the Japan Herald. The Nichi Nichi and Hochi remain to this day but the Shinjishi had to change hands in 1875 when the Government, in an effort to bring pressure to bear upon democratic newspapers, controlled the activities of foreigners in newspapers. The change of ownership brought decadence to the journal and the paper was discontinued shortly afterward.

Government and Press

Era of Terrorism An era of terrorism dawned upon Japan's journalism in 1875 when the government, dissatisfied with the way in which the press in general stirred up the discontented elements of the people, revised the press law with the avowed purpose of curbing the influence of the newspapers. Severe punishment was provided for violation of the press law. Journalists writing articles censuring the government were fined or imprisoned. Indeed, this was the first time journalists in Japan were exposed to punishment. Not content with this cruel legislation, the government in July, 1877, invested the Home Minister with power to suppress newspapers or delay their publication, and he was thus free to bring pressure to bear upon them as he saw fit. This objectionable law worked havoc with the press, whose progress was much hampered thereby.

The era in which newspapers served as political party organs began in 1881. Two years before that time the movement in favour of instituting the Diet was launched by the late Taisuké Itagaki and others.

Revised Press Law The government's desperate policy of oppression toward the liberals of the period, which resulted in the prohibition of the formation of political associations and the oppression of newspapers and magazines, came to a definite halt on December 26, 1887, with the enforcement of a new government decree. Two days later a revised press law was issued, considerably modifying the strict control of the press, which had had the effect of almost exterminating all the free political organs of the country. The new press law was drafted on the basis of the principle of "freedom of the press," recognized in the Japanese Constitution which was to be promulgated shortly. The new press law was received by journalistic circles with much satisfaction. Indeed, the modified press law marks a turning point in the history of the development of the modern newspaper in this country.

Whereas under the old law a prospective publisher had to apply for a permit to start a newspaper, by the new regulations he had only to notify the authorities of his intention to issue a journal. The prefectural governor was robbed of his power to suppress newspapers or confiscate the newspaper plants and only the Home Minister was given such power. Unreserved criticism for public good was admitted, and compared with the despotic rule that had prevailed before, newspaper management under the new law became markedly free.

Emergence of Independent Dailies

The approaching promulgation of the Constitution, coupled with the removal of the ban on the formation of political associations and the growing political enthusiasm among the people, revived political newspapers. In the meantime, the Diet was instituted and the majority of the best-known editors of influential newspapers were elected to the legis-

Digitized by Google

lature. As a natural consequence, the newspapers of these editors became their political tools and alienated public sympathy. Their popularity showed a decided tendency to wane.

The Kokumin and Yorozu While the political organs were thus losing influence, a strictly politically-independent newspaper which refused to cater for the popular taste of the people but which assumed an attitude to instruct the public was founded and caught the fancy of the intellectuals of the day. Its editing, however, was on the old lines and this newspaper never became popular. In the year 1890 Mr. Iichiro Tokutomi founded the Kokumin Shimbun, a popular newspaper. This journal enjoyed the support of the masses and soon other papers more or less imitated the style of editing inaugurated by the Kokumin. In 1892 the late Mr. Shuroku Kuroiwa founded the Yorozu Choho, which added to the Kokumin's style of editing a strong spice of sensationalism, devoting much of its space to the publication of detective and love stories. The Yorozu invaded the fields of the Miyako Shimbun, Yamato Shimbun and other newspapers then having the largest circulation. Thus, the promulgation of the Constitution served to bring about marked progress in the development of the modern newspaper in this country.

Chinese War and the Press The Sino-Japanese War (1894-5) caused severe competition in news reporting. The Osaka Asahi Shimbun, by introducing new features in covering war news, greatly increased the number of its subscribers. In Tokyo the Chuo Shimbun, closely affiliated with the military, was conspicuous for its activities in the issuance of extras and consequently gained an enlarged circulation. Other papers also sent war correspondents and featured news from the front. The Yorodzu then was the most popular newspaper, having a circulation of 50,000. In point of circulation the newspapers of that time were in the following order: The Yorodzu Choho, Kokumin Shimbun, Tokyo Asahi Shimbun, Miyako Shimbun, Nihon Shimbun, Chuo Shimbun, Tokyo Nichi Nichi Shimbun, Jiji Shimpo, Mainichi Shimbun, Yubin Hochi Shimbun and Yamato Shimbun. The war was also responsible for the appearance of influential provincial newspapers, including the Fukuoka Nichi Nichi Shimbun in Kyushu, the Shin Aichi in Nagoya, the Kahoku Shimpo in Sendai and the Hokkai Times in Hokkaido.

After the Russian War

Catering to the Public Following the Sino-Japanese War the majority of the newspapers in Tokyo adopted an impartial attitude toward politics and concentrated their efforts in popularizing their pages. To advance their sales they resorted to means which often savoured of vulgarism and received public criticism. The city of Osaka witnessed a duel between the Asahi and the Mainichi not only in business but in news gathering. In the meantime, the Russo-Japanese War (1904-5) occurred to start keen competition in war coverage. The Asahi both in Tokyo and Osaka, the Osaka Mainichi and the Jiji Shimpo competed severely in the matter of extras and increased their circulation. At the end of the war the peace treaty was signed at Portsmouth, but the peace terms were found unsatisfactory and stoutly opposed by all the newspapers of Tokyo and Osaka, with the exception of the Kokumin and the Chuo, both of Tokyo, the political organs of the then Government. Anti-peace mass meetings

Digitized by Google

were held both in Tokyo and Osaka, and in Tokyo the participants in the mass meeting, incited by inflammatory articles in one or two newspapers, turned into a mob and attacked the building of the Kokumin Shimbun. To suppress the mob the government had to proclaim martial law. The government simultaneously issued an urgent Imperial Ordinance and suspended the publication for certain periods of the newspapers which incited the public to violence. During one month shortly after the enforcement of the Imperial Ordinance the Yorodzu, the Niroku, the Miyako, the Nihon, the Jimmin, the Asahi of Tokyo and Osaka, and other papers were suspended. Of these papers, the Niroku and the Osaka Asahi suffered suspension twice in a month.

Equilibrium of Influence The panic in the newspaper world thus brought about upset the equilibrium of influence. The Kokumin was robbed of much circulation; so was the Chuo. The Yorodzu, with a special appeal to the youth of Japan, increased its circulation markedly. In Osaka the Mainichi took advantage of the suspension of publication which the Asahi suffered and invaded its unfortunate yet heretofore superior competitor's field, with the result that finally their influence in business and other respects became about even.

Motion Picture Utilized Several changes for the better were effected following the Russo-Japanese War, and it is noteworthy that the changes effected all concerned the newspaper enterprises. The Kokumin, which had suffered a dwindling popularity since the paper became the object of public censure by supporting the government that signed a "humiliating peace treaty," issued provincial editions, an example which was soon followed by other newspapers. Shortly afterward the Hochi attained success by issuing an evening edition. This ambitious enterprise was also followed by several other competitors. As regards the contents of newspapers, the Yorodzu reported all sorts of sports and amusements; the Asahi brightened its pages with articles from the pen of famous men of letters like the late Soseki Natsumé, and the Hochi established a precedent by carrying a novel in serial form that suited home reading. On the business side, the Hochi took the initiative in establishing provincial branches. The Yamato promoted an exhibition and began a motion picture demonstration show throughout the country.

That these enterprises attained favourable results soon showed in the increased number of circulation. According to reports considered reliable, the Osaka Asahi topped the list with 350,000. The Osaka Mainichi came next with 300,000, and the other papers came in the following order: the Hochi, 200,000; the Yorodzu, the Kokumin and the Yamato each 150,000; the Tokyo Asahi, 80,000, and the others 30,000 or 40,000 each.

In the Taisho Era

Expansion of the Business One notable advance made by the press of Japan during the Taisho era was the remarkable expansion of newspaper business. All first-class journals erected imposing structures for their offices and installed expensive high-speed presses. By the end of the era all the leading newspapers in Tokyo and Osaka had become public corporations with their capitalizations above the ¥1,000,000 mark. The earthquake and fire of 1923 reduced to ashes the majority of the newspapers in Tokyo, except the Hochi, Nichi Nichi and Miyako.

Digitized by Google

Of the unfortunate sufferers, those financially well off got to a good start and soon recovered their former positions, but those less financially favoured failed to raise their heads again and had to be content with insignificant showings. At present the Osaka Asahi and Osaka Mainichi possess more than 1,000,000 subscribers each, and big papers in Tokyo have subscribers approaching the above figure. It is not an exaggeration to say that the achievements made by the press of Japan after the dawn of the era of Showa (1926-) are a high-water mark of Japan's modern culture.

Present-Day Newspapers

The newspaper business in Japan as a whole in recent years has developed to such an extent that in its scale, system and construction as a modern industry, as well as in the rapidity and accuracy of news dispatching and reporting, it can be favourably compared with that in any other country of the world. The attainment of Japanese newspaper business is owing first to the cultural development of Japan and also to the strenuous efforts of men interested in the enterprise.

Number of Newspapers

The number of daily newspapers in Japan proper at the end of 1933 was 1,179, showing a gain of 55 over the end of 1932, according to government statistics. In addition, there were on the same day 461 newspapers issued 4 times or more a month and 5,038 newspapers issued 3 times or less a month. All these make an aggregate of 6,678. The newspapers classified according to prefectures follow :

Prefecture	Daily papers	Issued 4 times or more a month	Others and Total
Tokyo	208	102	1,510
Kyoto	39	14	300
Osaka	90	47	634
Kanagawa	18	4	83

Hokkaido	81	21	350
Total	1,175	461	6,678

Mainly in Tokyo and Osaka As may be seen from the above table, the majority of newspapers are published in Tokyo and Osaka. This is because Tokyo is the capital of the Empire and Osaka is the centre of social and economic life in West Japan. The combined number of

Digitized by Google

daily newspapers in the two largest cities is 25 per cent. of all and their combined circulation covers almost all parts of this country. Large daily papers have their own provincial editions of more than 20 kinds. The spheres of provincial editions are divided between the large papers of Tokyo and Osaka. Tokyo papers publish provincial editions for Eastern Japan, Hokkaido and Saghalien, while Osaka papers issue those for Western Japan, Shikoku, Kyushu, Korea and Formosa. These provincial editions eat into the business spheres of country papers. Recently, Tokyo and Osaka papers have been issuing Manchurian editions. Next to these cities in the number of their papers come Aichi (Nagoya), Hokkaido, Kyoto, Hyogo (Kobé), Fukuoka and Nagano prefectures, reflecting the extent of cultural development of those localities. Okinawa prefecture (Loochoos) issues only 16, the smallest number of all, and 19 are issued in Tokushima prefecture in Shikoku.

Increase or Decrease The following table gives the number of newspapers which increased or decreased each year, from 1922 to 1933 :

		With Guarantee Money				Without Guarantee Money			
	Sum total	Total	Daily	4 times or more monthly	3 times or less monthly	Total	Daily	4 times or more monthly	3 times or less monthly
1922	4,562	3,403	690	263	2,450	1,159	175	103	881
1923	4,592	3,608	762	264	2,577	989	131	81	777
1924	5,854	4,184	793	310	3,081	1,670	155	103	1,412
1925	6,899	4,739	826	313	3,600	2,160	186	142	1,832
1926	7,600	5,089	861	344	3,884	2,511	174	165	2,172

Circulation

Circulation Unpublished The circulation of daily newspapers in Japan ranges from about 4,000 to about 1,500,000. Japanese newspapers never make public their exact circulation. For this reason, it is impossible to get the exact figures of circulation of each or any. What is believed to be comparatively correct of the daily circulation of more than 1,100 newspapers is an estimate of about 19,000,000. The number of households in Japan is over 17,500,000. Newspapers are far more widely read in cities than in provinces and they are read more in commercial and industrial districts than in agricultural districts. Tokyo has the largest number of daily newspapers, and the more powerful ones are a well-defined force in society. Among them are the Tokyo Asahi Shimbun, the Tokyo Nichi Nichi Shimbun, the Yomiuri Shimbun, the Hochi Shimbun, the Jiji Shimpo, the Miyako Shimbun, the Kokumin Shimbun and the Chugai Shogyo Shimpo. The first-mentioned two papers are predominant, having an overwhelming influence in newspaper circles. As organizations for news reporting these two giant papers rank among the world's largest newspapers.

Osaka City has a relatively small number of daily papers, 86 in all, but, as regards circulation, the Osaka Asahi Shimbun, which is the head office of the Tokyo Asahi Shimbun,

Digitized by Google

and the Osaka Mainichi Shimbun, which controls the Tokyo Nichi Nichi Shimbun, predominate all, and their circulation is said to be nearly the same. The two papers have practically the whole of Western Japan under their control, and their influence is felt stronger in Kyushu districts by the publication of the "Kyushu Asahi" and the "Western Mainichi" commenced in February, 1935.

Estimated Circulation Estimated circulation of leading dailies in Japan at the end of 1933 was as follows:

Tokyo	
Tokyo Asahi Shimbun	1,100,000
Tokyo Nichi Nichi Shimbun	1,000,000
Jiji Shimpo	300,000
Yomiuri Shimbun	650,000
Chugai Shogyo Shimpo	150,000
Kokumin Shimbun	150,000
Hochi Shimbun	400,000
Osaka	
Osaka Asahi Shimbun	1,300,000
Osaka Mainichi Shimbun	1,200,000
Leading Provincial Papers	
Shin-aichi, Nagoya	200,000
Fukuoka Nichi Nichi, Fukuoka	180,000
Hokkai Times, Sapporo	100,000
Kahoku Shimpo, Sendai	100,000

Subscriptions Subscription fees of Japanese daily papers in large cities range from 80 to 90 sen. Airplanes are used for transportation between Osaka and Fukuoka, but in most cases it is done by trains and electric cars.

English-Language Papers English-language daily papers in Japan proper and colonies are as follows: The Japan Advertiser (American), The Japan Times (Japanese owned), both in Tokyo, the Osaka Mainichi English Edition (controlled by the Osaka Mainichi Shimbun), the Japan Chronicle (British), the Kobé Herald and Osaka Gazette (British), both in Kobé, the Seoul Press (Japanese), in Keijo, and the Manchuria Daily News (Japanese), Dairen.

System of Newspapers

The Asahi Shimbun Here the two representative Japanese dailies, the Tokyo (Osaka) Asahi Shimbun and the Tokyo Nichi Nichi (Osaka Mainichi Shimbun), are selected as examples for explaining the business system of Japanese newspapers. The Osaka Asahi Shimbun was founded in January, 1879. A retrospect of the past fifty years of the Asahi will "convince the public that the ideal set forth in the beginning that the paper should grow to be a great power like the 'rising sun', Asahi, and its opinion be as fair and impartial as the sun, has been fulfilled, for it now occupies one of the foremost positions among the daily papers not only of Japan, but of the world, and its views on current topics are very weighty in forming the public opinion of the country." The success of the Asahi is due to the able management of the late Ryuhei Murayama, whose career is identified with the history of the paper. It was in 1881 that he started the paper. With the financial support of the late Riichi Uyéno he pushed on the business.

The Mezamashi Purchased At that time Japanese journalism was in a backward position, and the daily papers were divided into two classes, one consisting of large papers whose main principle it was to discuss political problems, and the other of small papers printing novels and daily social events. The Asahi belonged to the latter category at first, but Murayama made his organ fall in line with the prevailing tendency, to become a paper possessing the characteristics of the two classes. He made it accessible to and readable for all classes of society. Inventions were utilized by him. For example, he made full use of the telegraph, which was not

Digitized by Google

commercialized then. In this way, the Asahi, which at first was in straitened circumstances, began to pay, and in a few years it grew to be one of the leading papers of Japan. He purchased a Tokyo daily named the Mezamashi in 1888 and renamed it the Tokyo Asahi Shimbun. Other large rival papers started a united front against the Tokyo Asahi, but it tided over the crisis. Murayama was the first newspaper manager to publish sister papers in the two largest cities of Japan, and this method was copied by the Jiji Shimpo, which started the Osaka Jiji Shimpo in 1905, although the two Jijis have now severed their connections altogether. The Asahi was the first of all Japanese papers to instal the rotary presses in 1890. After the Russo-Japanese War the Asahi by general consent became the largest paper in Japan. By this time, the Osaka Mainichi had begun to be the most influential rival paper of the Asahi. When the Russo-Japanese War broke out in 1904, the Asahi with its superior correspondence ramifications fulfilled its mission as reporting organization of the war. The following statistics give an outline of the status of the Asahi Shimbun.

Its Capitalization The Asahi Shimbun Publishing Company is a joint-stock concern with a capitalization of ¥6,000,000. The number of personnel, excluding despatch boys, was 2,212 for the Osaka Asahi and 1,583 for the Tokyo Asahi, a total of 3,795, at the end of 1933. The Asahi is equipped with 36 super-speed presses, one German Iris colour press, 2 German gravure presses, 19 airplanes, 500 carrier-pigeons, 2 sets of telephoto equipment and private telephones between Tokyo and Osaka. Besides its two dailies, the Asahi publishes the following periodicals all in vernacular: the Weekly Asahi, the Asahigraph (weekly), the Asahi Sports (bi-monthly), the Asahi Camera, the Screen and Stage, the Woman, Children's Asahi and the Library Editions of the Osaka and Tokyo Asahi (monthly). "Japan in Pictures," Asahigraph overseas edition (monthly) and "Present-day Japan" (annual), both in English, are published by the Asahi. It has its own special correspondents in London, New York, Paris, Berlin, Shanghai, Peiping, Nanking, Moscow, Los Angeles and Harbin and possesses both Junker and Puss Moth planes.

Its System The system of Osaka and Tokyo Asahi offices is:

- General Affairs Bureau
  - President
  - Vice-President
  - Managing Director
  - Directors
  - Auditors
  - Secretariat
- Printing Bureau:
  - Printing Section
  - Technical Section
- Business Bureau:
  - Sales Section
  - Advertising Section
  - Accounts Section
- Editorial Bureau:
  - Editing Section
  - News Dispatching and News Receiving Section
  - Politics Section
  - Social News Section
  - Photograph Section
  - Foreign News Section
  - Reference Section
  - Sports Section
  - Proof-reading Section
  - Asahigraph Section
  - Science and Arts Section
- Enterprise Section
- Aviation Section
- Section of Correction of Errors

Each bureau and section has its own chief. The editorial bureau has besides the sections, editorial managers, advisers and editorial writers, who are controlled by the chief of the editorial bureau.

Aerial Mail Service The Asahi Shimbun inaugurated regular mail

Digitized by Google

aviation between Tokyo and Osaka and between Tokyo and Sendai in 1923. With the establishment of the Japan Air Transport Company, the Asahi transferred gratis these services to the company. Since August, 1929, the Asahi has been operating the Tokyo-Niigata regular mail aviation.

The Osaka Mainichi and Tokyo Nichi Nichi The Osaka Mainichi originated in the Osaka Nippo, then the largest daily in Osaka, first published in 1876. The present name was adopted in 1888. Already in those days, the Osaka Mainichi was one of the most influential papers in the country. In 1889 the late Osamu Watanabé reorganized the paper into a partnership enterprise, with the support of the late Hikoichi Motoyama. The late Takashi Hara, afterwards Premier, once assumed presidency of the paper, but he let it in 1900 and was succeeded by the late Eitaro Komatsubara, once Education Minister. It was in 1903 that Motoyama became the president. Through his efforts the paper gained prominence. Its capitalization is ¥10,000,000, the principal shareholders being businessmen of Tokyo and Osaka. This is in contrast to the shareholders of the Asahi, who are mostly men connected more or less closely with the paper. In Tokyo, the Osaka Mainichi inaugurated the Mainichi Dempo and absorbed the Tokyo Nichi Nichi in February, 1911. The Tokyo Nichi Nichi, which thus came under control of the Osaka Mainichi, has the oldest history in Japanese journalism; it was published in 1872 by a group of the most advanced men of the day, including the late Genichiro Fukuchi, one of Japan's famous writers. Count Miyoji Ito once controlled this paper as a Government organ. In 1904, the paper was transferred to the Iwasaki family, the nucleus of the Mitsubishi interests. The Osaka Mainichi has a large staff, its members numbering 2,124 and the Tokyo Nichi Nichi 3,454. Motoyama died in 1932 and was succeeded by Mr. Motosuké Kido, whose position was chairman of the directorate following reorganization of the system. But, he soon resigned the post and was succeeded by Dr. Minoru Oka. The paper, in addition to its regular editorial staff, has many editorial advisers, including Mr. Iichiro (Soho) Tokutomi as contributing editor, Mr. Yosaburo (Sansa) Takekoshi, men of literary fame, and several others.

Its Departments The editorial department of the Osaka Mainichi and Tokyo Nichi Nichi consists of the editorial bureau which attends to the general make-up of the paper and to which are attached a political section, reference section ("morgue"), and camera squad; the domestic news bureau; the foreign news bureau (exclusive of the Eastern Asia news bureau, specially devoting its efforts to covering news in China, Manchuria and Siberian Russia) the central transmission bureau, which is in charge of receiving news from all parts of the country and also exchanging news with the Tokyo Nichi Nichi and vice versa; the literary bureau which attends to the editing of daily feature page, the Sunday Mainichi, a popular weekly magazine, the Mainichi year book, and other special publications; the editorial section which is composed of the editorial writers; and the proofreading bureau. All of these bureaux come under the direct control of the executive editor who is assisted by the editorial manager; the editorial director, meanwhile, controls the editorial writers of the Osaka Mainichi and the Tokyo Nichi Nichi. The business department consists of the sales (circulation)

Digitized by Google

bureau, the advertisement bureau, the accounts bureau, and the printing bureau, all of which come under control of the head of the business department. Like the Asahi Shimbun, the Osaka Mainichi Publishing Company maintains branch offices and stations and resident staff correspondents in all the principal cities of this country and abroad.

The Equipment It also has its exclusive long-distance telephone system between the Osaka Mainichi and Tokyo Nichi Nichi. A squad of specially trained stenographers at both ends send and receive news at the rate of 1,000 words per three minutes. The latest N.E. type telephoto apparatus, invented by Dr. Niwa, is used in sending not only photographs but facsimiles of official documents and important manuscripts between Tokyo and Osaka. The Osaka Mainichi typographical department has 11 Nippon Ultra-Lightning Presses, each one of which is capable of printing 150,000 4-page sections per hour; in addition, there are 12 high speed units, each one of which prints from 72,000 to 90,000 4-page sections an hour. The Nippon Ultra-Lightning Presses were built by R. Hoe & Company of America specially for the Mainichi. The Osaka Mainichi has a Lockhead Altaire plane, made by the Detroit Aircraft Corporation. The Osaka Mainichi plane develops a maximum speed of 227 miles an hour with a cruising range of 3,500 kilometres. The Tokyo Nichi Nichi has a Breda 33 High Speed Touring Airplane of Italian make.

Tickers and Accessory Business Two tickers are installed at the Osaka Mainichi. These instruments record the pulse of financial circles from time to time from the Osaka Stock Exchange. Each one of three units of the Albert rotogravure press (German made) can print 24,000 4-page sections per hour. These three combined can print a 48-page gravure magazine of half the standard newspaper size in one process. They are also capable of doing multi-colour printing. One of the features of the Osaka Mainichi is that since 1922 it has been publishing the Braille Osaka Mainichi, a weekly paper. This is the only periodical for the blind issued in Japan. The Osaka Mainichi also publishes a large number of periodicals, including Japan, Today and Tomorrow, an annual magazine printed in English, the Mainichi Directory, an annual publication in Japanese, the Sunday Mainichi, the Economist, a bi-monthly economic magazine in Japanese and many others. The Osaka Mainichi Charity Corps, organized in 1911, deal with circuit hospital-work, relief of the poor, poverty prevention, support of various social welfare enterprises and emergency relief of sufferers.

News Agencies

The Shimbun Rengo Tsushin Sha (Associated News Agency) is one of the two largest news agencies in Japan, the other being Nippon Dempo Tsushin Sha. The former used to be known as the Kokusai Tsushin Sha, which was founded by the late J. Russell Kennedy. He transferred his interest in the business to the present management. Shimbun Rengo consists of a large number of Japanese daily newspapers as members and its directorate is organized by representatives of six Tokyo dailies, two Osaka dailies and six large provincial papers. It maintains close relations with the Associated Press in America and with Reuter's, as well as the Tass News Agency in the Soviet Union in news dispatching to and from Japan. In domestic news service the institution plays the most important part. Mr. Yukichi Iwa-

Digitized by Google

naga is managing-director. Nippon Dempo was founded by Mr. Hoshio Mitsunaga, the present president. It is more outstanding in domestic news service than foreign cable distribution, which is maintained in co-operation with the United Press. Whenever important international events are held, these two news agencies make great competitive activity, sending their staff correspondents abroad.

Advertisements

Naturally advertisements form one of the largest sources of income of the newspaper business, along with the subscription fees. About ten large papers in Japan carry the majority of advertisements in the country; while other papers are doing a poor business in this field. For example, the Tokyo Nichi Nichi Shimbun secured altogether 527,000 lines of advertisements for April, 1932, and the Tokyo Asahi Shimbun acquired 422,000 lines of advertisements in addition to the "Want Ads." for the same month; but, in reality, their income from advertisements has been yearly decreasing, in spite of the fact that strenuous efforts are being made by leading papers for selling space. Eight large advertising service agents in Tokyo are supplying advertisements to daily newspapers on commission. These agents are the Nippon Dempo, Hakuhodo, Toyokuni Tsushin, Shojikisha, Kokokusha, Kohodo, Keikasha and Mannensha. "Want Ad." rates of the Tokyo Nichi Nichi and Tokyo Asahi are as follows:

	3 Line Ad.			5 Line Ad.			10 Line Ad.	
	Nichi Nichi	Asahi		Nichi Nichi	Asahi		Nichi Nichi	Asahi
Once	¥2.50	2.00	Once	4.20	4.00	Once	8.00	7.80
3 times	2.30	1.80	3 times	4.00	3.80	3 times	7.50	7.30
10 times	2.00	1.60	10 times	3.80	3.20	10 times	7.00	6.80
15 times	1.70	1.40	15 times	3.40	2.80	15 times	6.60	6.50
20 times	1.50	1.30	20 times	2.80	2.60	20 times	6.30	6.00

Newspaper Organizations

The Japan Newspaper Association (Nippon Shimbun Kyokai) This consists of daily newspapers, news agencies and advertising agencies under Japanese management; it was founded in 1913. His Imperial Highness Prince Naruhiko Higashikuni has been honorary president of this association since 1926. Count Keigo Kiyoura, former Premier, is president and Mr. Hoshio Mitsunaga, president of Nippon Dempo, is director-in-chief. It has among its honorary members noted persons such as Mr. Iichiro Tokutomi, Mr. Yukio Ozaki, Mr. Seiichi Uyéno, Dr. Jujiro Miyaké, Dr. Minoru Oka, Mr. Ukichi Oshima and Mr. Takeshi Azuma. The association membership includes almost all the Japanese daily newspapers. The Shunjukai is a social club of

Digitized by Google

newspaper editors, magazine writers and correspondents. It was organized in 1908 and has among its members leading newspapermen and magazine writers of Tokyo. The Nijuichinichikai is composed of high editorial staff members of daily newspapers. It was established in 1926. Its members are editorial directors, managers, news editors and other men of important positions in the editorial service of influential papers. The Shimbunkisha Club (Newspapermen's Association) consists of newspapermen and news agency reporters mostly connected with the business of the Imperial Diet. The Federation of Newspapermen and News Agency Reporters was organized in 1931. It consists of 46 newspapermen and news agency reporters' clubs which are connected with various governmental institutions and economic and financial bodies. Leading newspaper and news agency reporters' clubs are as follows:

Nagata Club	Connected with the Cabinet
Kasumi Club	Foreign Office
Yamashita Club	Seiyukai
Sakurada Club	Minseito
Kunai Kisha Kai	Imperial Household Department
Kokuchokai	Navy Ministry
Rikugunsho Kisha Club	Army Ministry
Naimu Kisha Club	Home Office
Takebashi Club	Ministry of Education
Zaisei Club	Ministry of Finance
Kinyu Club	Bank of Japan
Nosei Club	Ministry of Agriculture and Forestry
Unemé Club	Ministry of Commerce and Industry
Kabuto Club	Stock Exchange
Tetsudo Kisha Club	State Railways
Shiho Kisha Club	Ministry of Justice
Tokyo Undo Kisha Club	Modern Sports

Newspaper Courses in Universities The Meiji University and Jochi University, Tokyo, opened their newspaper courses in April, 1932. The Newspaper School (Shimbun Gakuin), founded by Mr. Shinjiro Yamané, of the Kokumin Shimbun, sent out its first graduates numbering 40 in December, 1932. The Tokyo Imperial University Journalism Course, established as a section of the Department of Literature was opened in April, 1932. Mr. Hideo Ono is in charge of the course. Lecturers include noted newspapermen and magazine proprietors having many years' journalistic experience. The Newspaper Course of the Jochi University was opened in April, 1932. Mr. Ono is in charge of this course also.

Students' Newspapers At the end of 1932 there were 51 so-called students' newspapers in Japan. These papers are published by universities and schools once a week or once or twice a month. The Teikoku Daigaku Shimbun, issued by the Tokyo Imperial University, is one of the largest of its kind and is issued every Monday. It is an eight-page paper, which was founded in 1920. The Kyoto Imperial University also issues a newspaper of the kind. The Mita Shimbun is issued by the Keio University and is one of the oldest and most influential of those published by private universities. It was founded in 1917.

Publications

A Historical Summary

The number of books published in Japan prior to 1881 is not accurately known. But judged from the records and catalogues of books now existing, they may be roughly taken as follows:

About 1,800 between the time of founding the country and one year before the time when the Shogunate Government was established at Kamakura.

About 5,000 since the establishment of the Shogunate Government at Kamakura until one year before the time when the Tokugawa Shogunate was established.

About 60,000 between the establishment of the Tokugawa Shogunate and the Meiji Restoration.

About 130,000 between the 1st and the 10th year of Meiji, 33,819 between the 10th and the 13th year of Meiji, and 679,368 between 1881 and 1924. Statistics for latest years follow:

1925	18,028
1926	20,212
1927	19,967
1928	19,880
1929	21,111
1930	22,476
1931	23,110
1932	22,104
1933	24,025
1934	26,331

Publications in 1934

General The publication of the country in 1934 was remarkable in that it showed a tremendous increase in the number of books put out. Viewed from the standpoint of contents of these books those on religion were so overwhelmingly large in number that in the latter part of the year books written on other subjects were overpowered by them. Aside from religious subjects, the book like "Japan-American Baseball Game" sold somewhere around 150,000 copies. But this was only an exception. In examining books written on subjects other than religion, it is found that it followed the footsteps of the preceding year. Publications on radicalism and fascism which were once so popular decidedly lessened in number and there were not more than ten of this description published. The contents of some of these books, did not go beyond expounding theories in an abstract manner. On the other hand, in view of the so-called crisis of 1935-6 and of the social conditions of the country, the mobilization of the moral forces of the people was considered necessary, and this was directly reflected on the publication of books.

Number of Publications The number of books published in 1934 was 26,331 (excluding publications by the Government), and was the largest ever seen. The tendency is that the number of publications is on the increase since 1932. This is especially marked in 1934, in which the increase over the previous year was 2,306. The figures for 1933 and 1934 as classified according to the kinds are as follows:

Kind of books	1933	1934
Ordinary books	16,472	16,921
Pamphlets and leaflets	5,468	7,117
Hand-bills	422	701
Photographs, maps, musical notes, drawings	1,663	1,592
Total	24,025	26,331

The comparative figures of publications in 1933 and 1934 show that a great increase in publications was shown in 1934 in three categories of

Digitized by Google

books, pamphlets and leaflets, and hand-bills. The examination of the subjects of publications amply shows the tendency prevailing in this country in 1934. The fact that the issue of hand-bills increased in a great proportion as compared with the previous year was due to the fact that labour disputes occurred in many places, the most important of which being that occurred in Tokyo between the Electric Department of Tokyo municipality and its employees.

Classification by Subjects Publications may be classified according to their contents into 31 kinds. Brief comments may be given on a few of them :

(A) Politics There were 704 books written on politics in 1934. As compared with 581 published in 1933, the increase was 123. The reason of the increase is that due to the change of the Cabinet, pamphlets with comments on the old and new Cabinets appeared in great numbers. Books which contained mere adaptations of the Western ideas disappeared, and their place was taken by publications which treated the subjects from the viewpoint or with reference to the Japanese spirit. This tendency was visible in 1933, but it was far more accentuated in 1934.

(B) Law There were published in 1934 635 books on law, which, as compared with 699 of the year before, showed a decrease of 64. Publication of books on law does not generally vary in number to any great extent every year. The reason that an unusual increase was witnessed in 1933 was that laws such as Draft and Cheque Law, Prevention of Cruelty to the Children Law, Regulations of Automobiles, and Pension Law were either enacted or revised, so that many books giving interpretations of new laws were published.

(C) Economics In 1934, 1,005 books on economics were published, which, as compared with 1,128 of 1933, showed a decrease of 123. The reason was that in 1933 translation of many books on economic conditions in the world, especially those in Great Britain and the United States of America, were published.

(D) Sociology In 1934, 832 books on sociology were published, which, compared with 990 of 1933, showed a decrease of 158. This was the tendency in the past several years, which is significant as reflecting the social conditions of the country. As explained before, publications on radicalism and fascism, or those which deal with the subjects on thought had been decreasing for some time and it is not too much to say that publications of that nature ceased to come out in 1934. These publications were being rapidly replaced by books which purported to arouse the Japanese spirit. The table below shows statistics of publications on sociology in the past four years :—

Year	1931	1932	1933	1934
Number	1,279	1,321	990	832

The great increase in 1932 was due to the fact that books on fascism was very popular. This, however, did not last long, and showed a great decrease in 1933, making a further decrease since then.

(E) Religion In 1934, 1,339 books on religion were published, which, compared with 1,045 of 1933, showed a great increase of 294. Books on religion, to which much attention had not been paid till a few years ago, became extremely popular in 1934. The lectures on the sacred books by the broadcasting, evidently set the vogue and swept the publication circle. But the question remains

Digitized by Google

if this tendency is destined to live long, for popularity of books seems to have no firm basis to stand on or the present popularity of religious books can not be regarded as a sign of religious revival.

(F) Military Affairs It deserves an attention that books on military affairs have increased a great deal in recent years. In 1934, the number published was 407, which, compared with 156 of 1933, show that it made a tremendous increase by 2.6 times. It explains how the people were aroused on the subject. Those published in October and November, were mostly those which treated the London Naval Disarmament Talks.

1933 and 1934 Compared The number of books published in 1933 and 1934 classified according to contents, and their comparative figures follow:

Books on	1933	1934	Increase or decrease in 14
Politics	581	704	123
Law	699	635	− 64
Economics	1,128	1,005	−123
Sociology	990	832	−158
Military affairs	156	407	251
Statistics	104	130	26
Shintoism	226	217	− 9
Religion	1,045	1,336	294
Philosophy	564	985	421
Education	2,727	2,798	71
Text-books	1,948	1,809	−139
Literature	2,652	2,431	−221
Languages	862	1,114	252
History	455	470	15
Biography	302	532	230
Geography	708	986	278
Travel	47	77	30
Mathematics	87	202	115
Physics	458	448	− 10
Engineering	387	724	337
Medicine	771	809	38
Industry	435	1,166	731
Transportation	73	151	78
Fine arts	844	907	63
Music	915	888	− 27
Amusement	451	552	101
Household	1,020	1,163	43
Handicrafts	94	67	− 27
Dictionaries	151	134	− 17
Series	18	234	216
Miscellaneous	3,027	2,415	−612

Of the total number of publications during the year 1934, 16,611 or 63 per cent. were published in Tokyo.

Merger of Two Printing Companies The question of merger of four largest printing companies in Tokyo, viz. Kyodo, Toppan, Nisshin and Shuei Sha arose sometime in the summer of 1932. If the merger materialized, it was thought that all the large orders of printing of books or magazines would be monopolized by the new company, and the other small printing firms would then be compelled to do only miscelleneous works, and its outcome was watched with very keen interest. Nothing was heard about the merger since then. In the meantime a new proposition for a merger was made through Mr. Giichi Masuda, member of the House of Representatives, who is director of both the Nisshin and the Shuei Sha. Two companies held a temporary shareholders' meeting on the 2nd of May, 1934, and passed officially the resolution for the merger. The new company has a capital of ¥6,000,000, of which ¥4,250,000 is paid up. The capital of the new company is the mathematical sum of ¥2,000,000 (of which ¥1,250,000 was paid up) of the Nisshin and ¥4,000,000 (of which ¥3,000,000 was paid up) of the Shuei Sha. Each of the two former companies has equal claims to the new company.

Imports and Exports During the Meiji and Taisho eras the imports of publications far exceeded the exports. The balance, however, gradually decreased because of a steady increase in exports. In 1934 the total value of imports amounted to ¥2,266,436 against ¥1,921,996 of exports. The destinations of the exports were mainly the countries where the Japanese are residing in great numbers, such as the Kwantung Province, Manchoukuo, the U.

Digitized by Google

S. A., the Hawaii Islands and China. The countries from which books are exported to this country are, in the order of importance, England, Germany, the U. S. A. and France. Details follow:

Public Libraries Public libraries both official and private are to be found in all parts of Japan. During 1933 there were 4,686 public libraries throughout Japan.

The largest public library in Japan is the Imperial Library situated in Uyéno Park, Tokyo. Here large reading rooms allow visitors by the thousand to be seated comfortably. There are a countless number of old and new books stored for public perusal. A feature of this library is the large number of books from foreign countries which the institution possesses for its visitors. Books may also be taken outside, but this privilege is enjoyed only by yearly subscribers. The Tokyo Imperial University Library, rebuilt following the earthquake and fire of 1923, is another large library in Japan.

The following table gives detailed figures regarding the number of public libraries, both official and private, and the number of visitors, and the number of books collected:

Table Showing No. of Libraries, Visitors and Collection of Books

Year	No. of libraries	No. of collection of books	No. of visitors
1929	4,490	8,592,000	22,847,000
1930	4,553	9,276,000	22,835,000
1931	4,609	9,636,000	23,355,000
1932	4,609	10,138,000	24,980,000
1933	4,686	10,563,000	24,766,000

Magazines

Historical One of the oldest magazines in Japan was the "Meirokuzasshi" which was published in 1873. But this magazine was full of heavy material only suitable for scholars.

Digitized by Google

It was four years later that a number of magazines to cater to popular interest came into existence. The magazine named "Marumaru-chimbun", for instance, was one of these and was full of sarcastic verses, popular lyrics and also of many laughter-provoking cartoons. Short stories were also favourable reading matters in it. For novels principally appeared the "Hodan-zasshi". For pleasure-reading the "Robunchimpo." There also appeared a magazine named "Tokyo-shinshi" written chiefly in Chinese, but decidedly erotical. There were also such ones as the "Homei-shinshi," "Moon and Snapping Turtle" and "Kwagetsu-shinshi," and "Shimbunshi."

The "Homei-shinshi" was a more or less imitation of the "Tokyo-shinshi." The "Tsuki-to-Suppon" (Moon and Snapping Turtle) was largely a cartoon paper. The "Kwagetsu-shinshi" (Flower and Moon Magazine) was a pure literary paper under the editorship of Ryuho Narishima and lasted about five years from 1879. The "Shimbunshi" (New Proses and Verses) was under the editorship of Shunto Mori. Political magazines also were not slow to arise. The "Ohmei-shinshi" was a private organ of democratic politicians such as Saburo Shimada, Ikuzo Ohoka and Ryo Koyezuka and was full of fervent articles of democratic principles. The "Fuso-shinshi" was also another of this type of magazines, and there were many others of this sort of papers. No one, however, lasted long, because they all evoked official ban soon. Among these political magazines there was one "Dekinei-sodan" which is remembered by the imprisonment of Eitaro Komatsubara, later Education Minister, on account of his anti-Government articles. It was not, however, Mr. Komatsubara alone who was sent to jail on account of one's political view outspoken in letters. Many were imprisoned on account of similar offences. Ryuhoku Narishima of the "Kwagetsu-shinshi" was once forced to spend months in jail. As the day of the first opening of Parliament drew nearer, the number of political magazines increased. In 1886 the "Chuo Koron" (Central Review) was first published. The year 1887 was an epoch-making in the history of magazines in Japan as it was in February of that year that Mr. Iichiro (Soho) Tokutomi started a publishing society named "Minyusha" with the "Kokumin-no-tomo" as its organ which surpassed all other periodicals of the day in the amount of circulation. A few months later the Kokumin Shimbun, a daily paper, was published by the same society headed by Soho Tokutomi. In June the Hakubun-kwan was brought into existence which soon published the "Nippon Taika Ronshu" (Essays by Great Scholars). This resulted in a big success. The "Jogaku-zasshi" (Ladies' Magazine) of Zenji Iwamoto, the "Kyoiku-hochi" (Educational News) of Sannosuké Kusakabé and the "Tetsugaku-kwai Zasshi" (Philosophical association magazine) of Yenryo Inouyé, were publshed almost simultaneously. The circulation of the aforesaid "Nippon Taika Ronshu" was indeed an epoch-making in the sales of all published matters in those days. In 1889 the Hakubunkwan published the "Nippon no Shonen" (Children of Japan) which surpassed the "Nippon Taika Ronshu" in the amount of circulation. Even that, however, counted only ten thousand, a fact quite uncomparable to the modern colossal number of successful publishing matters. The business condition of the Hakubunkwan went on successfully and in January, 1895, they published the

Digitized by Google

"Taiyo" (Sun) which soon secured 50,000 readers. In 1904 another hit was made by the issue of the "Nichi-Ro Senso Shashin Gaho" (graphic news of the Russo-Japanese War) which was published alongside the "Nichi Ro Senso Jikki" (true stories of the Russo-Japanese War), with 150,000 copies published. Some months later such magazines as the "Jitsugyo no Nippon" (Japan of Business), "Fujin-sekai" (World of Women), "Nipon Shonen" (Youths of Japan) etc. were published by Mr. Giichi Masuda which caused a great sensation among the magazine people. Another noted publisher of those days was a certain Mr. Shimada who published a number of periodicals for youths and children and also for arts to an equally big surprise to other publishers. It is of interest to note that both Mr. Masuda and Mr. Shimada as well as Mr. O-hashi of the Hakubun-kwan were men from Niigata prefecture. In 1919 the "Kaizo" was published and became a good rival of the "Chuo Koron" which had attained leading position in the magazine world of Japan by this time. Years later came another big magazine man and he was Mr. Seiji Noma, now president of the Dai Nippon Yuben-kai (Eloquency Society of Great Nippon) and also president of the Hochi, one of the leading dailies in Tokyo. His first periodical enterprise was the "Yuben" (Eloquency) which was followed by the "Kodan" (Heroic Story) "Club" "King", "Fujin (Women) Club" and "Gendai" (Present Day). It is a matter of surprise, indeed, that the circulation of the "King" numbers one million copies monthly. In the meantime, the "Taiyo" of the Hakubun-kwan which lasted 36 years disappeared from the magazine world. Soon a rival of the "King" in the bigness of circulation appeared and that was the "Shufu-no Tomo" (Friend of Household Wives) by Mr. Takeyoshi Ishikawa.

Present State At present these two, the "King" and the "Shufu no Tomo", are the two rival million scale periodicals in Japan, and following them are the "Hino-dé" (Sun-rising) of the Shincho-sha, "Kaizo" (Reconstruction) of the Kaizo-sha, "Chuo-koron" (Central Review) of the Chuo-koron-sha, Bungei-shunjyu" (Literary Review) of the Bungei-shunjyu-sha, etc. all of which are for popular interest or for women.

Hardly a month passes without seeing seven or eight new magazines. Of course, this increase is counteracted by those which are discontinued. After all, however, whilst there is continuously a great number of magazines that disappear, there are constant recruits.

Serious Periodicals Those patronized by intelligentsia are the "Chuo Koron", the "Kaizo", the "Gaiko Jiho", and others. The last mentioned one is specialized in foreign affairs, but the first mentioned two have a wide sphere of current topics treated in them. Politics, social affairs, economic depression, education, religion and other matters are substantially printed. These magazines have readers of many years' standing. The "Bungei Shunju" prints mostly literary articles in its regular issues and fictions and novels in its special issues. The Nihon Gaiji Kyokai, otherwise known as the Foreign Affairs' Association of Japan, which was founded in 1931, publishes a monthly titled the "Kokusai Hyoron" (International Review), which characterizes in printing articles regarding events of international and domestic affairs of a serious nature. The association also issues an English-language

Digitized by Google

quarterly, "Contemporary Japan", which is the only English-language magazine in Japan treating politics, foreign affairs, economy, finance and social problems of this country. These Gaiji Kyokai periodicals are read by people of enlightened class and rank among magazines of the most advanced status in this country.

Economic and Woman's Journals Students of economy and finance in Japan and close observers of industrial situation of Japan take interest in reading the "Diamond", the "Economist" and the "Toyo Keizai", all claiming a high reputation for many years as economic periodicals. The first-mentioned especially is read by investors in securities. Magazines standing for nationalism are read widely along with a general tendency, of which nationalism is gaining momentum, while those of communist taint are neglected. However, magazines for State socialism are not at all to be despised by reading public. As women's magazines, the "Fujin Koron", the "Fujin Club", the "Shufu-no Tomo", etc., are read widely among young women.

LIST OF PRINCIPAL PERIODICALS

Politics, Law and Social Magazines:
- Chuo Koron (Central Review)
- Kaizo (Reconstruction)
- Kokusai Hyoron (International Review)
- Sekai Chishiki (World Knowledge)
- Shakaiseisaku Jiho (Social Policy Review)
- Kokusai Chishiki (International Knowledge)
- Gaiko Jiho (Diplomatic Review)
- Bungei Shunju (Literary Review)
- Hogaku Shimpo (Science of Law)

Finance and Economic Magazines:
- Toyo Keizai Shimpo (Oriental Economic Review)
- Economist
- Diamond
- Keizai Orai (Economic Review)
- Keizai Chishiki (Economic Knowledge)
- Keizai (Economy)

Popular Magazines:
- King
- Hinodé (Rising Sun)
- Kodan Kurabu (Kodan Story Magazine)
- Gendai (Present Generation)
- All Yomimono (all Stories)
- Hanashi (Story)
- Shinseinen (New Young Generation)

Literary Magazines:
- Bungei (Literary arts)
- Bungaku (Literature)
- Bungaku Hyoron (Literary Review)
- Shincho (New tide)
- Araragi, a waka magazine
- Hototogisu, a haiku magazine
- Butai (Stage)

Woman's Magazines:
- Fujin Koron (Woman's Review)
- Fujin Kurabu (Woman's Club)
- Shufu-no Tomo (Friend of Ladies)
- Fujin-no Tomo (Woman's Friend)

CHAPTER XXXV

LITERATURE, ARTS AND MUSIC

Literature

History

Yamato Period The history of Japanese literature may be divided, in accordance with the political development of the country, into 6 periods: the Yamato, Heian, Kamakura, Muromachi, Yedo and Tokyo periods. The Yamato period comprises the Kodai (archaic period) and the Nara age that followed. The term, Yamato, is derived from the district of Yamato wherein was the seat of the Imperial capital throughout that age. This nascent age of Japanese literature ended in 781 A. D., with the removal of the Imperial capital to Kyoto, then called Heian, by the Emperor Kammu. It may seem improper to include so long a period under one section, but this early stage of Japanese literary growth can thus conveniently be considered as one concrete age, and be studied as such.

(1) Literary works. The literary works which reveal the mind of the Yamato period and which are still extant, are: the Kojiki, Nihonshoki, Fudoki, Norito, Senmyo, Mannyoshu, Kaifuso, and Nihonraiki. The principal writers are: Ohno-Yasumaro, Toneri-shinno, Yamabéno-Akahito, Kakinomotono-Hitomaro, Yamanoeno-Okura, Otomono-Yakamochi, Ohmino-Mifuné, besides certain sages of the prehistoric age. The last mentioned, Ohmino-Mifuné, was proficient in Chinese classics and poetry.

(2) Development and classification. Narrative prose and lyric verse assumed concrete form in this period. From a literary point of view the writings of the period can be divided into two sections: works in descriptive style, of which the Kojiki is the main representative; and poetry that followed, with the Mannyoshu[1] anthology as the typical poetic composition.

Individual self-consciousness realized meagre general development; instead, a collective sense controlled society. But ample evidence of a pure national spirit is seen. In the latter part of this period alien ideas were introduced from China and India, but could not find their way deeply into the minds of the people. It is not to be wondered at, therefore, that the literary achievements

1 Mannyoshu (or Manyoshu) The anthology is considered to be one of the greatest poetical attainments of the nation not only in this period, but all through the Japanese history of literature. Its compiler is unknown. The period, in which the poets of the book lived, covers 450 years from 313 to 764 A.D., and the range of the social standard of the poets extends to all classes from the Emperor down to the farmer or the hermit. The book contains 4,496 poems, which consist of 262 long poems, 4,172 waka and 62 others. Their themes are taken from human relations, love, lamentation, the four seasons, and natural scenery. They are written in the Yamato dialect with Chinese characters. The eminent anthologists in it are Kakinomotono-Hitomaro of the epic long poems; Yamanouéno-okura of the long lyrics who took his themes from social and economic problems of his day; Yamabeno-aka-hito, the only poet on nature among the group; Ohtomono-yakamochi who is believed to be the compiler of the book himself by many critics, and Nukatano-ohogimi and Sakanoé-iratsumé, who distinctly tower above many poetesses who left beautiful love songs with the anthology to their posterity.

Digitized by Google

of this awakening period are instinct with the noble national spirit of loyalty and ancestor-worship, permeated with the national traits of optimism, frankness, and genuine simplicity.

Heian Period The Heian period starts from the year in which the Emperor Kammu removed the Imperial palace to Kyoto, then called Heian, and ends in 1186 when the Shogunate government was established by Yoritomo Minamoto at Kamakura. This second literary period, covering nearly 400 years, following the period of dawn, saw Japanese prose and poetry reach full bloom.

Generally speaking, the literature of the period emerged from a style of clear-cut simplicity to one of elegance and delicacy, all literary productions assuming a mood of refined sentiment. In presentment likewise there appeared the graceful kana syllabary, in keeping with current ideas. This harmonization of content and form in the literature of the Heian period set an example to succeeding generations. The Heian period is thus the golden age of Japanese literary achievement. The period may further be subdivided into the following four sections:

Early Heian period (781-884)
Middle Heian period (885-980)
Mature Heian period (981-1064)
Last Heian period (1065-1182)

(1) Early Heian Period. During this period, imported Chinese culture exercised no small influence on the literary circles of the country, resulting in the popularity of Chinese classics and poetry. Among poetical works are the Ryounshu, Bunkashureishu, Keikokushu, while among authors were the Emperor Saga, Kukai, Onono-Takamura, Miyakono-Yoshika, Oyeno-Otondo, Sugawarano-Koreyoshi, Tachibanano-Hirosuké, Sugawarano-Michizané, Fujiwarano-Sukeyo and Miyoshi-Kiyoyuki. With the overwhelming influence wielded by these imitators in the domain of newly imported Chinese literature, the Japanese waka (31-syllabled poem) was threatened at one time with relegation to obscurity. But the situation was saved through realization of a proposal from Sugawarano-Michizané to discontinue the customary visits of Government envoys to China. In consequence, Chinese literature gradually lost its former influence, and the eminent position once occupied by this alien form of belles-lettres was taken by Japanese poetry. The forerunner of the revived waka verse was the Rokkasen, a collaboration of six representative poets, namely, Ariwarano-Narihira, Onono-Komachi, Bunyano-Yasuhidé, Kisen-hoshi and Otomono-Kuronushi. A further literary achievement of the period is the appearance of works in the Japanese kana syllabary, such as the Taketori-monogatari and the Isé-monogatari.

(2) Middle Heian period. This is the age of national consciousness when the waka poetry triumphed over Chinese forms, pushing itself forward like tidal waves. In poetry works like the Kokin-wakashu and Gosen-wakashu are prominent, while in fiction such works as the Utsubo and Ochikubo and Tosa-nikki, in Japanese kana syllabary, are representative products.

(3) Mature Heian period. This is the period in which the literary development of the Heian era attained the highest perfection, creating a golden age of prose. In the field of waka we have such poets as Izumi-shikibu, Akazome-Emon, Fujiwarano-Kinto, Fujiwara-Sanekata and Noin-hoshi, while in the realm of prose there appeared woman novelists, like Murasaki-shikibu and Seisho-nagon, the former being

Digitized by Google

the authoress of the Genji-monogatari,[1] while the latter composed the Makurano-soshi, opening up a literary régime of women, as if flowers of innumerable variety and colouring blossomed all at one time.

(4) Last Heian period. A general survey of the period gives the impression of its being politically transitional from Imperial rule to Shogunate administration. Along with the decline of the Fujiwara family in power, literature also hastened towards decline. And in consequence, towards the early part of the period the literary cult turned from novels to historical works, producing the Eiga-monogatari and Okagami. In the realm of poetry also a new tendency was apparent, which gave birth to such noted poets as Toshinari Fujiwara and Saigyohoshi ; and at the same time a scientific criticism of poetry was initiated and prevailed under students like Mototoshi Fujiwara, Toshiyori Minamoto, and Kiyosuké Fujiwara.

(5) General development. The most characteristic feature of the period lies in the movement from impromptu and lyrical poetry to stories and narration which require plots and objectification of things. The instinctive or primitive sentiment of the Mannyoshu precedes the more intellectual Kokinshu ; and the Shikashu that followed is pervaded by more meditative and philosophical reflections. With reference to prose, the myths and legends appearing in the Mannyoshu and Kiki (short for Kojiki and Nihonshoki) underwent mutation and took the form of narrative tales in the Taketori-monogatari and the Isé-monogatari. This realistic tendency was further augmented by the Utsubo-monogatari, and later produced the famous Genji-monogatari, turning its direction thenceforward toward historical compositions, such as the Eiga-monogatari and the Okagami. To enhance this realistic tendency of the time legends and fairy tales mingling with current realism regained their former influence, producing the Konjaku-monogatari, a fairy tale dealing with supernatural and supersensuous things. Furthermore, amid this abundance of literary composition there are others with characteristic features common to meditative, lyrical literature, namely the Tosa-nikki, Murasaki-shikibu-nikki, Makurano-soshi, Izumi-shikibu-nikki, Tombo-nikki, Tonominé-shosho-monogatari and Sarashina-nikki.

Kamakura Period The period of about 150 years, beginning with the Minamotono-Yoritomo Shogunate government at Kamakura in 1182 and ending in the Kemmu era of 1334, is called the Kamakura period, in the history of our literature. For the first 50 years literature was under the influence of the preceding Heian period ; but the one hundred years that followed saw two literary currents sweeping against each other, one at Kyoto, the cultural centre,

1 Genji-monogatari The author Murasaki-shikibu (975–1031) was born a daughter of Tametoki Fujiwara, a family of the illustrious Fujiwara clan, and served at Court for some years as lady-in-waiting to the Empress Akiko. She is known as Lady Murasaki, but her personal name is not known. It is a large book (nearly 1,900 pages in Arthur Waley's English translation), written in a pure old Japanese, extremely refined and pregnant, with Japanese character, or kana, sentences, and literary critics agree in the opinion that it belongs to the greatest masterpieces of the world novels.

Genji-monogatari means the Tale of Genji, mainly a love story between the hero Genji and several heroines. It is also a most vivid picture of a civilization, nine hundred years ago, probably as refined, though in the central city only, and certainly as colourful, as the world has ever known. The most striking thing about the book is how modern, how universal is its feeling. It reflects the Oriental characteristics in every line and still shows human nature very much the same as the Occidental.

Digitized by Google

and the other at Kamakura, the pivot of political authority. Although, during the period, there was no literary movement worthy of special mention, yet it created its own literary atmosphere which resulted in the production of numerous so-called war-tales and religious literature.

(1) Kamakura literature. The fact that the emotional and sentimental tendency of earlier ages gradually turned to philosophical meditation during this period explains why the works of the time are generally void of individual touch while being true to type. Buddhist pessimism then dominated social thought. The popularization of the Buddhist religion in this period was the result of the natural growth of that religion on the one hand, and of the reaction of public sentiment against the ceaseless civil wars, on the other.

(2) Representative works. War literature, like the Hogen-monogatari, Heiji-monogatari, Heiké-monogatari and the Gempei-seisuiki, is the most outstanding production of the age. Just as in the preceding period, when literary material was gathered from historical facts, so in the Kamakura period subjects were sought for from the social conditions obtaining when bloodshed, side by side with the simple, artless life of the samurai, completely saddened and subdued public sentiment. With reference to waka, inspired by the advent of well-known poetical works like the Shin-chokusenshu, were born the Zoku-gojuishu and Kinkaishu. The Shin-kokinshu, another anthology of poetry, shows the highest point that Japanese poetry had so far reached. The Kinkaishu suggests a return to the Mannyoshu, while the Shin-chokusenshu gives an impression of having reached the acme of poetical refinement, retracing its way back to the beauty of simplicity. It is a pity, however, that rival influences between groups of literary men and critics in study of literary theory left the healthy development of literature very much handicapped. Ranking as principal poets of the period were Gotoba-joko, Tsuchimikado-joko, Juntoku-joko, Yoshitsuné, Sadaié, Iyetaka, Jakuran and Sanetomo.

Muromachi Period The Muromachi period is the term applied to the 270 years sandwiched in between the Kamakura and Tokugawa periods, beginning in 1335 when Takauji Ashikaga rebelled against the Emperor Godaigo and terminating in 1603 when Iyeyasu Tokugawa removed the Shogunate government to Yedo.

(1) Muromachi literature. In consequence of civil disturbance in the preceding age, the literary movement of the period was rather stagnant: the Court nobles were deprived of their positions, while the militarists, taking advantage of the disorderly administration of the central government, exercised an unfavourable influence on the natural development of literary talent generally. Nevertheless, even in such helpless social conditions, the period had the literature peculiar to such an age. Despite the troublesome yoke of historical events, there emerged a certain free and simple literary style; hence, instead of the waka, tales, and diaries, that flourished down to the close of the last period, such descriptions of war and historical tales as the Masukagami, Jinnoshotoki, Taiheiki, Yoshitsuneki and Soga-monogatari were born, besides rambling notes like the Tsurezuregusa, with their own characteristic attractions.

(2) New Forms of Literature. It is worthy of special mention that in this chaotic period originated such new literary forms as the renka,

Digitized by Google

yokyoku (utai), kyogen and otogi-soshi, which saw full development in the following period. Tanka (or waka) verse developed and gave birth to a more diminutive mode, the haikai (or haiku); kyogen evolved into joruri and drama; while otogi-soshi reappeared in the form of novels and plays, all in the period that followed. Herein we notice the beginnings of modern thought, the product of classicism evolving into modernism, and aristocracy into plebeianism. The Muromachi period thus occupies an important position in our literary history, functioning as a bridge that connects the preceding periods with the more illustrious Yedo literature. Another thing worthy of note in this connection is the creation at this time of the Kanazawa Bunko, the Ashikaga-gakko and the Gozan-bungaku, the first two being seats of learning and the last a branch of literature.

Yedo Period The Yedo period begins in 1603 when the Tokugawa Shogunate took up the task of civil government in Yedo, and ends, after 265 years, in 1868, when the Meiji Restoration was accomplished. This forms the most important section in the history of Japanese literature. The Yedo literature succeeded the decadent Muromachi literature and handed on its wealth of achievement to the Meiji period. The remarkable fecundity of this era is to be attributed to various factors, but to none more fundamental than the good government of Iyeyasu Tokugawa, the first Shogun of that line. Realizing the importance of the diffusion of learning for good government, he engaged Confucian scholars, published books, started schools and collected rare literary works. The example thus set by the first Shogun was emulated by succeeding Shoguns, each striving to open up the way for easier access to knowledge and culture both in town and country, until in the Genroku era under the rule of the fourth Shogun, Tsunayoshi, national culture reached its highest stage of development. The Yedo period may be divided into the following four sections:

Centered around Osaka and Kyoto,

1. Period of enlightenment (1603-1680)
2. Period of development (1681-1741)

Yedo as the centre,

3. The period of eastward advance of literature (1741-1791)
4. Period of maturity (1791-1868)

(1) Period of Enlightenment. True to its name, this period, following the establishment of the Tokugawa Shogunate in Yedo, saw the collection and publication of ancient books, and annotations thereof, as well as translations of Chinese literature. It is but natural that during this period nothing worthy of note was produced save as foundation work in preparation for what was to come. From another viewpoint this is the age when our traditionally mystic view of art, and our undue belief in tradition, greatly wanes in influence.

(2) Period of Development. A bird's-eye view of the period gives the impression of a rapid development in popular literature, with Osaka and Kyoto as the centre and the Genroku era as its climax. The origin of this literary movement is traceable to the Mitogaku, which later led to a renaissance of the classics; we see a revival of haikai verse under Basho, the poet; and then the appearance of Chikamatsu's joruri. Each made unfettered development within its own sphere of influence. Towards the close of the period, however, these branches of literature lost popularity, until eventually they could scarcely enjoy public recollection.

Digitized by Google

of this awakening period are instinct with the noble national spirit of loyalty and ancestor-worship, permeated with the national traits of optimism, frankness, and genuine simplicity.

Heian Period The Heian period starts from the year in which the Emperor Kammu removed the Imperial palace to Kyoto, then called Heian, and ends in 1186 when the Shogunate government was established by Yoritomo Minamoto at Kamakura. This second literary period, covering nearly 400 years, following the period of dawn, saw Japanese prose and poetry reach full bloom.

Generally speaking, the literature of the period emerged from a style of clear-cut simplicity to one of elegance and delicacy, all literary productions assuming a mood of refined sentiment. In presentment likewise there appeared the graceful kana syllabary, in keeping with current ideas. This harmonization of content and form in the literature of the Heian period set an example to succeeding generations. The Heian period is thus the golden age of Japanese literary achievement. The period may further be subdivided into the following four sections:

Early Heian period (781-884)
Middle Heian period (885-980)
Mature Heian period (981-1064)
Last Heian period (1065-1182)

(1) Early Heian Period. During this period, imported Chinese culture exercised no small influence on the literary circles of the country, resulting in the popularity of Chinese classics and poetry. Among poetical works are the Ryounshu, Bunkashureishu, Keikokushu, while among authors were the Emperor Saga, Kukai, Onono-Takamura, Miyakono-Yoshika, Oyeno-Otondo, Sugawarano-Koreyoshi, Tachibanano-Hirosuké, Sugawarano-Michizané, Fujiwarano-Sukeyo and Miyoshi-Kiyoyuki. With the overwhelming influence wielded by these imitators in the domain of newly imported Chinese literature, the Japanese waka (31-syllabled poem) was threatened at one time with relegation to obscurity. But the situation was saved through realization of a proposal from Sugawarano-Michizané to discontinue the customary visits of Government envoys to China. In consequence, Chinese literature gradually lost its former influence, and the eminent position once occupied by this alien form of belles-lettres was taken by Japanese poetry. The forerunner of the revived waka verse was the Rokkasen, a collaboration of six representative poets, namely, Ariwarano-Narihira, Onono-Komachi, Bunyano-Yasuhidé, Kisen-hoshi and Otomono-Kuronushi. A further literary achievement of the period is the appearance of works in the Japanese kana syllabary, such as the Taketori-monogatari and the Isé-monogatari.

(2) Middle Heian period. This is the age of national consciousness when the waka poetry triumphed over Chinese forms, pushing itself forward like tidal waves. In poetry works like the Kokin-wakashu and Gosen-wakashu are prominent, while in fiction such works as the Utsubo and Ochikubo and Tosa-nikki, in Japanese kana syllabary, are representative products.

(3) Mature Heian period. This is the period in which the literary development of the Heian era attained the highest perfection, creating a golden age of prose. In the field of waka we have such poets as Izumi-shikibu, Akazome-Emon, Fujiwarano-Kinto, Fujiwara-Sanekata and Noin-hoshi, while in the realm of prose there appeared woman novelists, like Murasaki-shikibu and Seisho-nagon, the former being

the authoress of the Genji-monogatari,[1] while the latter composed the Makurano-soshi, opening up a literary régime of women, as if flowers of innumerable variety and colouring blossomed all at one time.

(4) Last Heian period. A general survey of the period gives the impression of its being politically transitional from Imperial rule to Shogunate administration. Along with the decline of the Fujiwara family in power, literature also hastened towards decline. And in consequence, towards the early part of the period the literary cult turned from novels to historical works, producing the Eiga-monogatari and Okagami. In the realm of poetry also a new tendency was apparent, which gave birth to such noted poets as Toshinari Fujiwara and Saigyohoshi ; and at the same time a scientific criticism of poetry was initiated and prevailed under students like Mototoshi Fujiwara, Toshiyori Minamoto, and Kiyosuké Fujiwara.

(5) General development. The most characteristic feature of the period lies in the movement from impromptu and lyrical poetry to stories and narration which require plots and objectification of things. The instinctive or primitive sentiment of the Mannyoshu precedes the more intellectual Kokinshu ; and the Shikashu that followed is pervaded by more meditative and philosophical reflections. With reference to prose, the myths and legends appearing in the Mannyoshu and Kiki (short for Kojiki and Nihonshoki) underwent mutation and took the form of narrative tales in the Taketori-monogatari and the Isémonogatari. This realistic tendency was further augmented by the Utsubo-monogatari, and later produced the famous Genji-monogatari, turning its direction thenceforward toward historical compositions, such as the Eiga-monogatari and the Okagami. To enhance this realistic tendency of the time legends and fairy tales mingling with current realism regained their former influence, producing the Konjaku-monogatari, a fairy tale dealing with supernatural and supersensuous things. Furthermore, amid this abundance of literary composition there are others with characteristic features common to meditative, lyrical literature, namely the Tosa-nikki, Murasaki-shikibu-nikki, Makurano-soshi, Izumi-shikibu-nikki, Tombo-nikki, Tonominé-shosho-monogatari and Sarashina-nikki.

Kamakura Period The period of about 150 years, beginning with the Minamotono-Yoritomo Shogunate government at Kamakura in 1182 and ending in the Kemmu era of 1334, is called the Kamakura period, in the history of our literature. For the first 50 years literature was under the influence of the preceding Heian period ; but the one hundred years that followed saw two literary currents sweeping against each other, one at Kyoto, the cultural centre,

1 Genji-monogatari The author Murasaki-shikibu (975–1031) was born a daughter of Tametoki Fujiwara, a family of the illustrious Fujiwara clan, and served at Court for some years as lady-in-waiting to the Empress Akiko. She is known as Lady Murasaki, but her personal name is not known. It is a large book (nearly 1,900 pages in Arthur Waley's English translation), written in a pure old Japanese, extremely refined and pregnant, with Japanese character, or kana, sentences, and literary critics agree in the opinion that it belongs to the greatest masterpieces of the world novels.

Genji-monogatari means the Tale of Genji, mainly a love story between the hero Genji and several heroines. It is also a most vivid picture of a civilization, nine hundred years ago, probably as refined, though in the central city only, and certainly as colourful, as the world has ever known. The most striking thing about the book is how modern, how universal is its feeling. It reflects the Oriental characteristics in every line and still shows human nature very much the same as the Occidental.

(3) Eastward Advance of Literature. This is the period when the so-called Kamigata literature of Kyoto and Osaka, began its movement eastward to establish a new literary movement in the city of Yedo, the seat of the Shogun's government. By this time the popular literature founded by Chikamatsu and Saikaku had declined. Buson became the representative haikai poet of the time. Besides haikai, there came into vogue in Yedo various kinds of short poetry, namely, senryu, witty epigrammatic verse; kyoka, comic verse; and kyobun, nonsense notes. Also in this period the so-called literature for men of the world cropped up, following the publication of the kibyoshi and sharébon.

(4) Period of Maturity. It was in this period that the construction of the main body of Yedo literature was completed. As a result of the encouragement of learning by the Shogun's highest official, Sadanobu Matsudaira, both art and learning made a remarkable advance, producing a number of artists, and authorities on Japanese and Chinese classics. Parallel with this phenomenal development of classics, popular literature resumed its firm grip on the public. Inasmuch, however, as during the latter half of the period the country was completely upset by troubles both from within and without, most of the literary progress was confined to the early part of the period. Nevertheless, this is known as the period when Yedo literature was crowned with full maturity.

What most characterize Yedo literature are its fecundity in kinds, volume of production and sphere of influence. Not only was it prolific but, all branches of art and learning, from the aristocratic classics down to kyoka, senryu, haikai, joruri (gidayu) and popular novels, showed systematic advancement. The social structure in those days could not but react on the taste and sentiment of the people, as is evidenced by the two different literary currents that prevailed throughout the period. Whereas the so-called aristocratic literature, which dominated those days, stood on a foundation of Bushido and Confucianism, the popular literature strove to create the epicurian's world. Each of these tendencies went on cultivating its own field of influence in its own respective class, yet what most aptly represents the characteristic features of Yedo literature is the stronger public appeal of popular literary works. These intellectual diversions of the common people, unlike the traditional, conservative and retrogressive taste of classical literature, are optimistic, and charged with the spirit of uplift and mirth. But the negative policy of the Tokugawa government proved an impeding factor in the healthful growth of popular literature, resulting in a gradual loss of individuality. In this way authorship gradually kept aloof from essential requirements of progressive art; the most glaring example of this deplorable tendency is clearly noticeable in Bakin's works.

Tokyo Period The Tokyo period of Japanese literature begins with the Meiji Restoration of 1868 and still happily continues in our present Showa era. In this short period of sixty-five years the volume of national literature surpasses any other period in Japanese history. The same can be said of its quality.

(1) A general survey of the literary movements of this period reveals the enormous influence exercised by Western literature; all works have thus been enriched in quality and enabled to rank among the most advanced literatures of the

Digitized by Google

West. The present period can conveniently be subdivided into four sections in the following way, chronological figures being given for form's sake:

1. Period of transition (1868-1886)
2. Period of new literary movement (1887-1901)
3. Period of naturalism (1902-1910)
4. Period of neo-romanticism (1911-)

(1) Period of Transition. During this time the new and old forms and types of literature maintained coexistence, beginning with the earliest years of the Meiji era and terminating about the 12th year, when the Shosetsu-shinzui by Shoyo Tsubouchi was published. In the early part of the period, still under the influence of the reserve energy of the preceding Yedo period, the novels of Kanagaki-Robun, the plays of Kawataké-Mokuami, the Sosho style haiku all made their influence felt; but the tendency to inertia could not cope with the destructive invasion of European thought and principles; namely, the utilitarianism of Britain and America, the universal love and altruism of Christianity, French liberalism and German nationalism. To be more concrete, in the realm of fiction there appeared, through the influence of such English writers as Lytton and Scott, the Keikoku-bidan by Ryukei Yano, the Kajinno-kigu by Shiba-Tokaisanshi, Setchubai by Tetcho Suehiro, Ryokusuidan by Suto Nansui, and Bunmei-tozenshi by Meikaku Fujita, which were brought out one after another. All these are political novels. Following these came the Shosetsu-shinzui and Tosei-shoseikatagi, written by Shoyo Tsubouchi, sign-posts pointing to the new-born movement in national literature. Coincident to the rise of the new literary movement appeared a new form of poetry with the publication of the Shintaishisho. Mingled with these new renaissance phenomena the cultural and literary aesthetics of France and Britain were being introduced through translations.

(2) New Literary Movement. The most outstanding characteristic of the literature of this period is that it completely relinquished Yedo influence and established its own assimilation of the romantic thought then sweeping over Europe and America. Realism, especially psychological delineation, came to be demonstrated by novelists like Shoyo Tsubouchi and Futabatei Hasegawa. They were soon followed by Koyo Osaki, Rohan Koda, Bizan Kawakami, Kyoka Izumi, Ryuro Hirotsu, Chugai Goto, and Ichiyo Higuchi, a woman novelist. These fiction writers dealt with either idealistic, pungent or psychological materials. Especially noteworthy for phenomenal activity in poetry were Toson Shimasaki and Bansui Tsuchii, composers of long poems; and Tekkan Yosano, Saishu Onoé and Kun-en Kaneko in the sphere of tanka verse. Furthermore, there was the Negishi school initiated by Shiki Masaoka, and the Araragi school by Sachio Ito. As to haiku verse, under Shiki Masaoka were composers affiliated with the Nihon school; under Koyo Osaki was founded the Shiginsha school, and with the combined efforts of Seisetsu Sassa, Shiei Fujii and Shachiku O-ono was formulated the Tsukubakai. To criticize briefly the works of the period it may be said that though not altogether lacking in a touch of realism, the general impression indicates an ever-growing trend towards romanticism, and in some cases to mere literary "isms."

(3) Period of Naturalism. The

Digitized by Google

trend of literary movement during the last quarter of the Meiji era was toward the domination of naturalism. This literary current emerged in all forms of literature, and, founding itself on the actual reality of things, tried to grasp the truth of humanity. In this sudden rise of naturalism, much influence was exercised by the works of French, German and Russian novelists. Representative Japanese novels indicative of this new movement include works by Doppo Kunikida, Toson Shimasaki, Katai Tayama, Hakucho Masamuné, Shusei Tokuda, Seika Mayama, Homei Iwano, Seiko Nakamura and Shuko Chikamatsu. Against this realistic trend there appeared in the literary arena Soseki Natsumé, Kyoshi Takahama and Ogai Mori, upholding the transcendent school, commonly called the Kotoha. In the realm of literary criticism Hogetsu Shimamura, Tenkei Hasegawa, Tengen Katakami and Gyofu Soma wielded their pens under the banner of art for life's sake. In the domain of drama, plays depicting social thought came into existence under Ibsen's influence. A similar trend was apparent in general poetry and short verse, represented by Yumei Kamowara's and Kyukin Susukida's symbolic poems, Gyofu Soma's poems in colloquial style, Rofu Miki's free verse and Hakushu Kitahara's prose-poems. In the sphere of short poems, came Bokusui Wakayama, Aika Doki, Takuboku Ishikawa and Yuguré Maeda, exploiting new fields, just as Hekigodo Kato and Seisensui Ogiwara did in the realm of haiku. Literature created in the atmosphere of naturalism is generally too much involved in representation of the ugly side of human life, failing thereby to see the whole of life. It is not unnatural, therefore, that the naturalistic trend of the period did not long enjoy public support and was obliged to effect a change towards the close of the Meiji era.

(4) Period of Neo-romanticism. We may be doing injustice to modern literary movements by crowding all their complex currents under the one category of neo-romanticism. Yet, it is a fact that after the predominant sway of naturalism, every new branch of literary activity obviously based itself on the reactions of the naturalism of the preceding period. Contrary to the negative, sceptical and pessimistic view of life as evinced by naturalism, neo-romanticism attempts to draw from life with the eye upon reality and humanity, in a positive attitude and a spirit of optimism. At the back of this new movement were the pragmatism of William James, Bergsonian philosophy, Tagore's mysticism, Tolstoy's humanism, and the ideas of several other influential Occidental writers. Neo-romanticism was, in its early days, supported by Rinsen Nakazawa, Yohei Ishizaka, Jiro Abé, Saneatsu Mushakoji and other youthful thinkers. It was at that time that the European War broke out. This greatly stimulated the literary movement, pushing it further into the actual life of the people; eventually it built up such intimate human relations that a drastic renovation was considered unavoidable. This welcomed the rise of many new novelists and playwriters; among whom were Saneatsu Mushakoji, Takeo Arishima, Yoshio Nagayo, all holding fast to their principles; Toyohiko Kagawa and Koyata Ebara initiated the vogue of religious fiction and literature; Naoya Shiga, Ton Satomi, Ryunosuké Akutagawa, Yoshio Toyoshima, Masao Kumé, Haruo Sato and Kan Kikuchi cultivated their own field, in a characteristic style of description. In addition to these fiction writers there

Digitized by Google

arrived on the scene, Seikichi Fujimori, Mimei Ogawa, Kan Eguchi and Hiroichiro Maedako, as representative socialistic writers; and no small number of novelists producing popular literature. Similarly, in the circle of drama quite a number of new playwriters appeared: of these, Kichizo Nakamura, Yuzo Yamamoto and Jun-ichiro Tanizaki were the most noted. Shoyo Tsubouchi, aforementioned, opened up a new field in pageant and juvenile plays. Another novel phenomenon worthy of note is the powerful growth of scenario writing. With reference to poetry, the long form gradually developed into prose, while folk-songs came to the fore, in Yaso Saijo, Shogo Shiratori, Sakutaro Hagiwara and Ujo Noguchi. The overwhelming vitality of the ever-growing literary movement also lent stimulation to the composition of short poems which, following the revival of Mannyoshu study, tried to assimilate nature while giving birth to new verse composed in colloquial style. As to haiku, there is nothing which requires special mention, save the tendency to re-establish itself in couplet form. Summing up all these facts, we arrive at the conclusion that Japanese literature has made wonderful strides and built up a nation-wide sphere of influence that qualifies it to rank with world literary attainment, without forgetting to maintain its own traditions and thereby to create a new and distinct literature of its own.

Contemporary Tendencies

Some of the more prominent movements in modern Japanese literature passed through so many critical phases after the middle of the Taisho (circa 1916), that they began to suffer decline at the close of the period; and then new movements began to appear.

The First Stage First there is the movement towards proletarian literature, Ohmi Komaki, Yobun Kaneko, Hirabayashi, Aono and Maedako made the first systematic attempt to create literary movement for the proletarian classes, and it was in this circle that such promising writers as Hayama, Kuroshima, and Taiko Hirabayashi were brought up.

The Second Stage Launched by a few younger writers who gathered around Kan Kikuchi, eminent novelist and dramatist, this group promoted new ideas of sensual beauty by abandoning the old conventions and aesthetic notions. Riichi Yokomitsu, disclosed a new realm of style in fiction, being much influenced by the French novelist, Paul Morand.

This literary circle loves fantasy and imagination, thinking much of form and style. Their idea is to stress the outside rather than the inside, the material more than the spiritual. Their refinement of style displays a rapid tempo, and new sensations, which contributed to its popularity among the later generation.

The Third Stage The third stage in our present-day literature is marked by a powerful appeal from the "Literature for Majority." Kan Kikuchi, changed over to this new movement in fiction. In the tenth year of Taisho (1920), "Madam Pearl" was brought out, and this incited the emulation of many other writers.

There are two aspects indicated in the "Literature for Majority." One of these tends mostly to depict modern life struggles in an attractive way; Kikuchi, Kumé, and Kato are included in this circle. Shirai, Maki, Naoki, and Osaragi are mostly concerned in producing historical and biographical fiction, full of fantastical descriptions.

Digitized by Google

To the Proletarian groups already mentioned can be added another group of novelists like Nakano, Murayama, Kobayashi, Hayashi, Tokunaga, Fujimori, Ineko Kubokawa; and critics like Kurahara and Miyamoto. On the other hand, a type-setter, Choku Tokunaga, produced a clever work, "The Street without the Sun," which was translated into German. The labourmen, Sui and Kanechika, are also beginning to produce able and promising works.

The prominent phenomenon of the literary world in 1933 was the decline of proletarian literature. The decline is due partly to a thorough suppression of the radicalists by the authorities and partly to the general feeling of the people against communism as a disturber of national order in the critical moment of the country, brought about by the Manchurian Incident. The leading periodicals began to keep the young communistic writers at a respectful distance from the January number of the year and the old writers who had their days in the Meiji era were reinstated in their place. The tendency of the year was decidedly reactionary in literature, especially in novels.

A few works of the proletarian writers such as Tokunaga, Fusao Hayashi, and Fujimori attracted the attention of society. But the death of promising young writers Takiji Kobayashi and Toshiro Sasaki gave a blow to the progress of proletarian literature.

On the other hand, the old distinguished men of letters made valuable contributions. Among them the following names may be recorded: Toson Shimazaki, Junichiro Tanizaki, Haruo Sato, Ton Satomi, Saneatsu Mushakoji, Kan Kikuchi and Masao Kumé.

In the world of drama almost no original work was published, except some translations of Western dramas.

There is hardly any room for a poet to live upon his profession and the present-day Japanese poets live without exception on some other profession and form groups for publishing the Dojin Zasshi or magazine for comrades.

The appearance of the "Bungei" a magazine for "pure" literature in 1933 threw a light for the future progress of literature.

In 1934 religious literature began to flourish on the waves of the so-called Renaissance of religion in Japan while magazines of poetry witnessed a greater circulation.

Introduction of French literature represented by Valéry and André Gide and a fresh study of Russian literature, which once was most influential in literary circle of Japan, has given a mode of thought to young writers.

Fine Arts

History

Pre-Asuka Period This period, corresponding to what is called the dark age of art, has nothing specially to describe, although it is perhaps the longest period, extending, as it does, from the age of myths down to about the 7th century, A. D.

According to archaeology the ancient Japanese worked in stone, artifacts such as stone images being used in ancestor worship. These are rough hewn sculptures, representing persons clad in armour, wearing a sword, or other arms, all having been used in burial as guardians of the tomb. It was customary, too,

Digitized by Google

in ancient times to have a similar primitive engraving, in the form of a ladder or a wheel, made on the coffin; the plain, artless impression thus conveyed is expressive of the simple mode of living in that remote age.

The dwellings were also in very simple style, constructed of barked but unhewn timber. Even in this simplest type of building there were two styles, known as the Izumo and the Isé; which implies that the ancient culture of Japan was dual, derived either from Izumo or Isé. The former style of structure is represented by the Izumo Shrine, Izumo province; and the latter by the great Shrine of Isé, although these now give no more than a vague idea of what must have been the prehistoric architecture of the country.

In addition to the above, there are earthen figures called haniwa which arrest the attention not only of archaeologists but also of artists. According to historical records, the Emperor Suinin, who abdicated in 2 B. C., abhorred the cruel old custom of burying people alive, around the grave of a high personage, certain individuals being selected from among those persons who were under patronage of the deceased in life. At the instance of a retainer, Nomi-no-Sukuné, he caused earthen figures to be interred in place of living persons, when the Empress Hihasu-himé died; and this was the origin of haniwa. It is believable, however, that the haniwa existed before Suinin's time. The haniwa is, from an artistic point of view, by no means of high value. It is, nevertheless, the only art product of Japan before the importation of Buddhism. Moreover, its value rests on the fact that it is a work produced solely by the Japanese before they had been influenced by Chinese art. Besides, it is invaluable in that it gives some idea of the life of the people of its day. The variety of haniwa may be roughly classified into human figures, birds and animals, architectural structures, household articles and arms.

Asuka Period As has been stated in the preceding section, for sometime after the foundation of the Empire by the Emperor Jimmu, there was nothing worthy of mention in the realm of art. The Asuka period covers the reign of the Empress Suiko (592-629), when the Imperial palace was in the province of Yamato. Already, as early as the time of the Emperor Yuryaku, in the middle of the 5th century, a painter named Isura came over from Chosen, with which country Japan then had frequent intercourse, and through which Chinese civilization had been introduced. Later, during the reign of the Emperor Sushun, towards the end of the 6th century, another painter called Hakka came with carpenters to build temples. But it was not until Shibatatto came over from China, in the reign of the Emperor Keitai (507-533), that Buddhism was introduced into Japan, despite the fact that communication had long before continued with Chosen, then called Kudara.

Shibatatto must have been expert in the art of sculpture, for he was the grandfather of Kuratsu-kurinotori who cast the large image of Buddha now in the Horyuji temple, in the Empress Suiko's time. Nevertheless, it is evident that the country which contributed most toward founding Japan's fine art technique was Kudara.

The development of art in the Suiko régime was really wonderful. Prince Shotoku, a man of wide learning and an enthusiastic devotee of Buddha, spurred on the ever increasing devotion to art. The leading

Digitized by Google

structures of the period were the Horyuji and Tennoji temples; but those parts of them that have best withstood the wear and tear of time are the two-storied kondo, gate, the five-storied pagoda of the Horyuji temple and the three-storied pagodas of the Horyuji and Horinji temples. No doubt the creative design of the Prince must have been woven into them, but it is nevertheless true that they were modelled after Kudara architecture. It is only from these structures that one can form any idea of what Chinese architecture in those days might have been. The Tamamushi-no-zushi, (a miniature temple) in the Horyuji temple, is valuable not only as a model of ancient architecture but as an example of the structural art and craft of the Suiko régime. The honeysuckle design on the metal fittings of the miniature temple bears close resemblance to similar art motives of Greece. The sculptures of the Suiko period are not all from one source, some coming from China or Chosen, while others are home creations, either from the hands of Chinese sculptors, or the combined efforts of Japanese and naturalized aliens.

The fine art of the Suiko period has thus great depth and width, and at the same time affords invaluable reference for study.

Hakuho Period In the history of Japanese fine art, following the Suiko era comes the Hakuho period which starts in the reign of the Emperor Jomei, terminating in that of the Emperor Mombu (629-697). In the 15th year of the reign of the Empress Suiko the custom of sending a government envoy to China, then called Sui, was established, followed by increased intercourse between the two countries. Later, in the 2nd year of the Emperor Jomei's administration, the first envoy was dispatched to Tang, as China was then called. By the establishment of this custom artistic products of China came direct to Japan instead of through the Korean Peninsula, as they had done up to that time. Moreover, the Taika Reformation, by which the political system of China came to be closely followed from the time of the Emperor Kotoku, contributed much toward developing Hakuho art.

(1) Painting. One of the most outstanding facts in the art of this period is that paintings were imported from the Continent, and Buddhist pictures were painted by priests from China and India. The mural paintings of the kondo of the Horyuji temple testify to this; the fresco work of the temple is further advanced in technique than that of India, and is prized as the leading example of mural painting in any extant wooden building. This and other examples of imported pictorial art technique during the period eloquently speaks of the inflow from Indian sources into Oriental countries.

(2) Bronze. The most representative work of the period is the big bronze images of Buddha and two disciples at the Yakushiji temple at Nara. Upon their pedestals are engraved a hoshokumon design in lieu of honeysuckle which by that time had ceased to command preference. The hoshokumon design is the art of inlaying or setting jewels in necklaces, armlets, pedestals, and halos around the heads of images. To return to the Yakushiji temple's three images, it is interesting to notice that, side by side with the hoshokumon, there is an engraving of arabesque design in grapes. This grape pattern has also its origin to the west of India, through which it came to China when that country was called Han, and prospered in the age of Tang.

(3) Architecture. The only mod-

Digitized by Google

el of architecture constructed in this period and still extant is the three-storied pagoda of the Yakushiji temple at Nara. Another example of the best architectural technique of the period is to be seen at the Nara Imperial Museum where models of five-storied pagodas of the times are preserved.

Tempyo Period The Nara period (707-780) is called the Tempyo Era in the history of Japanese fine art. Through the zealous efforts of the Emperor Shomu and Empress Komyo, who were unrivalled in piety, Buddhist doctrine was thoroughly demonstrated in the capital of Nara, with a consequent development of Buddhist fine art. It was veritably the golden age of fine art in religion. The casting of the Daibutsu (great image of Buddha) at the Todaiji temple and the construction of the temple itself may be pointed out as the greatest examples of art within the period. The Daibutsu has several times suffered from fire, which made imperative the repair of the image; and, in consequence, only the petals of the lotus blossom upon which the image sits retain traces of contemporary art motives. On the surface of these petals are engraved scenes from the sacred world of Buddha, which, from the view point of technique in painting are decidedly excellent. In front of the building occupied by the colossal statue of Buddha there is a bronze-lantern which minutely exemplifies characteristics of the Tempyo period. The remains representing the sculptures of the period include several images in the same temple.

(1) Shoso-in Museum.[1] After the demise of the Emperor Shomu all the objects of art and craft he possessed were donated to the Todaiji temple

---

1 The Shoso-in is located in the precinct of the Tōdaiji temple at Nara. The building is a typical wooden storehouse of old Japanese Aze-Kura style. No metal nails are used and no walls of earth. The whole building consists of three separate sections which have no windows but one entrance door for each. In the interior each section is two storied with an attic. The dimensions of the building are approximately 108 feet to 30 feet, the height from the ground to the roof top being 39 feet.

Formerly the treasures were kept free from light, untouched for a long period of years. Since 1872 the doors are open annually for airing for two weeks, from November 1st to 14th. All the precious objects are kept in glass cases. In the northern section there are kept treasures of the Imperial House before and at the time of the Emperor Shōmu, mirrors, desks, musical instruments, screens, medicine, etc. The middle section contains arms and armour, cases, glass and lacquer wares. The southern section largely contains religious antiques of the Tōdaiji temple.

The Shoso-in apparently existed in the precinct of the Tōdaiji temple before 756 A.D. when the Empress Komyo, widow of the Emperor Shomu dedicated to the Variocana Buddha or Daibutsu the Imperial treasures as a memorial of the deceased. Weather has beaten it of course. Battles went on around the sacred ground and the Shoso-in itself was once stricken by a thunderbolt. But the wooden storehouse has been mysteriously preserved through 1,179 years, with partial repairs. Most of its contents listed in the "Tōdaiji Kemmotsu Cho" (catalogue of donation), dated June 21, 8th year of Tempyōshōhō (756 A.D.), have been kept unhurt solely due to the loyalty of the officials and people to the Imperial House to whom the Shoso-in belongs.

The most important treasures are the "Kemmotsu Cho" (catalogue of donation), letters of the Emperor Shōmu, essays written by the Empress Kōmyō, slung sword of the Emperor Shōmu, Kin-gin Hyomon Kin (gold and silver ornamented Oriental harp), Shitan Genkwan (a stringed instrument), Gogen Biwa (a five stringed lute), Mokuga Shitan Kikyoku (a sandalwood checker board ornamented with wooden mosaic), Toriké Tachionna Byobu (a screen with a female figure who wears feathered garments), Urushi Ko Hei (a lacquered carafe), Yōraku or diadems and fragments of the crowns of the Emperor Shōmu and Empress Kōmyō, Gingaku Men (masks used in an old performance "gigaku"), bronze mirrors, swords and other arms and armor; Imperial edict engraved on a bronze plate, glass cup, lacquered chest painted with gold and silver dust, gold and silver ornamented leather box, hangings with figures of Buddhas, Mitta Ebon (a painted tray), silver bottle, and cencor with a handle.

Priceless documents of Tempyō period are stored in Shoso-in, 779 in all. They include census registers, maps, official documents, I.O.U. and books, and present indispensable materials for the study of official and civil life 11 centuries ago.

For protection, inspection of the treasures of the Shoso-in is not permitted to the general public, but the pictures of all treasures are published in book form named "Tōyei Zuko," and all the documents may be found in the "Dai Nippon Ko Mon Jo" (Japan's old documents).

Digitized by Google

by the Empress Komyo. Nearly all were treasured in the Shoso-in Art Museum of Nara, and have safely been handed down to the present. Perfect preservation of art products from so remote an age could be expected only in such a country as Japan. The national treasures of the Shoso-in not only abound in rare paintings but also in many objects of industrial art, such as textiles, lacquer-ware as well as gold and silver ware, porcelain and writing utensils. Especially noteworthy are the Tang masterpieces from the Imperial household of China. In addition to those of Japanese and Chinese production, examples from the East Roman Empire, Persia, India and countries west of China are found in the museum. Thus the Shoso-in Art Museum is representative of the art products covering both East and West from even before the 7th century.

(2) Ganjinwajo. A priest known as Ganjinwajo in Japan with a number of disciples, visited Nara, then capital of the country, not long after the completion of the Daibutsu. He and his followers had drifted ashore in the southern part of Kyushu. These foreigners left an indelible impression on the history of Japanese art, because they belonged to a group of leading artists of the Tang period of China. Their skill in art was woven into the art of the Tempyo period, not only in the fields of painting and sculpture, but also in architecture. That art products from their hands must have been as great in number as in variety is evidenced by the art treasures of the Toshodaiji temple in Yamato province. The image of Buddha enshrined in that temple exhaustively represent the characteristics of the art of the Tang dynasty. Besides these there are several wood-engravings in which, it is surmised, the sculptures of the succeeding period had its origin. Among the foreigners were persons of other than Chinese nationality. Gumporiki, as he was called in Japan, was an expert sculptor, from the country of Kunlunkuo the exact location of which is still a question. Judging by the fact that the Ganjinwajo party included people from the west of China, it is but a matter of course that the engravings at the Toshodaiji temple resemble the fresco art of countries west of China. From what remains, there is sufficient reason to believe that some of the descendants of the Persians driven out of the country by the Mohammedans, arrived in Japan with the party.

All kinds of cultural forms and products were imported during this period. These the Japanese could digest and work with a skill not inferior to that of the foreigners. A general impression of the Tempyo period, however, is that there was too much copying of Chinese art and so, too little originality. This one-sided trend of evolution gave rise to a movement for a revival of art genuinely Japanese in origin.

Konin Period The Konin period (782-888) begins about the time that the Emperor Kammu transferred the capital from Nara to Kyoto, lasting till the reign of the Emperor Konin. The outstanding characteristic of the Konin period lies in the phenomenal rise of native art at the hands of noted priests. Kobodaishi and Chisho-daishi were priest sages of refined artistic endowment. Quite a number of pictures and sculptures of the period are from their hands. The Toji, Koyasan and Miidera temples treasure works of theirs. As one of the prominent painters of the time we may name Kudara Kawanari on whom there are a number of books, but none giving reliable historical information

Digitized by Google

about him. He must have been among those artists summoned by the Emperor Saga to paint the pictures of landscape and rough seas seen on the walls and paper sliding-screens of the Seiryoden Hall of the palace. The custom of painting landscapes and characters on screens of the Imperial palace was thereafter developed setting a fashion in drawings which please the eye. In those days screens were popular, and this helped to popularize landscape painting.

The typical sculptures of the period are such sacred images as are seen at the Shingoji temple, Kyoto, known as the Shingoji style sculpture, and others at the Murofuji temple in Yamato province, known as the Murofu style. The rise of the art of engraving images of Japanese gods may be mentioned as a memorable event of the age.

As regards architecture the period shows very few examples that now remain, the representative structures being the main hall and five-storied pagoda of the Murofuji temple. The Heian Shrine constructed in Kyoto, closely modelled after the structures of the age under review, offers excellent material for the study of Konin architecture.

Fujiwara Period The Fujiwara period (889-1186) covers the three hundred years between the reign of the Emperor Uda and that of the Emperor Antoku. At the beginning of the period the Emperor Uda, at the suggestion of Michizané Sugawara, discontinued the custom of dispatching envoys to China, thereby cutting off facility of communications with the continent. During the consequent isolation Japanese art was afforded a chance to cultivate its native genius and its own field of influence. The continental art that had been freely absorbed and adopted up to that time commenced to produce national characteristics as is demonstrated by yamatoyé work in the sphere of painting.

(1) Painting. Koseno-Kanaoka was probably the most skilled landscape painter of the period. His reputation was such that the horse he painted on a paper sliding-door was credited with getting out of the screen at night to feed on bush clover in the yard. Koseno-Hirotaka, a well-known painter, was one of his descendants. As skilled painters of that age we may mention also Motomitsu Fujiwara, Mitsunaga Fujiwara, Takayoshi Fujiwara and his son Takachika, besides Toba-sojo and Kakuyu, all of whom specialized in painting yamatoyé or native style, which had developed from a school in the Tang period of China, called Karayé. Japanese paper-doors and folding screens were what they selected to paint on.

Besides yamatoyé many other schools of Japanese style paintings were started, such as the kamiyé, utayé, ashideyé, and okoyé. The last mentioned was a school of comic genius whose premier artist was Toba-sojo, a noted priest of the day. Three albums of comic pictures from his brush are treasured at the Kozanji temple. Another important arrival was the yemakimono (paper-scroll) which later developed until reaching its golden age in the Kamakura period. The aforementioned three artists were the most popular masters of the age. Some of their work still survives.

Consequent upon the ever inculcated Buddhist precepts, Buddhist paintings flourished, so much so that specialists in that art were always in evidence. In this religious sphere of painting also national characterization was effected to no meagre extent. The most outstanding of the Japanized Buddhist schools was named the Eshinfu, started by Eshin-

Digitized by Google

sodzu, a priest, first affiliated with the Tendai sect of Buddhism, but later preached the doctrines of the Jodo sect. Probably this school was second to none at that time in Japanization of technique. Tameto, commonly called Great Takuma, who did the fresco work of the Ho-o-do at Uji, belonged to the Takuma family, producing accomplished painters of the time. The most representative Buddhist paintings are treasured at the Hokkeji, Yamashiro Chohoji, Yamato Horinji, Koyasan, the Toji temples and the Imperial Art Museum of Tokyo.

(2) Sculpture. Remarkable advancement in the realm of Buddhist sculpture was revealed in consequence of effective doctrinal propaganda by the Tendai and Shingon sects. Wood-engraving stood unrivalled, but that art, unlike the same mode of the previous age, was mainly in what is called parquetry work. Sculptors collaborated, and in most cases images were constructed in separate parts, each carved by a different artist, under an accomplished specialist. It is interesting to note that even in the carving of hands, feet, head and body there was a division of labour into smaller parts, and each section was put in charge of one sculptor. When completed the several parts were put together, painted with lacquer and guilded.

Guilds of sculptors, like the Shichijo - bussho, Shichijo - omiya - bussho, Rokujo-marikoji-bussho and Sanjo-bussho, established studios one after another. Especially noteworthy in this field was the Shichijo-bussho started by the famous artist Jocho who was practically supreme in the realm of sculpture in the Fujiwara period. The peculiarity of the Jocho school of his creation lies in its soft, mild features with smooth, elegant textile folds or plaits, which characterize the most glorious period of Fujiwara art. The images of Amitabha enshrined at the Ho-o-do, Hokaiji, Saikyoji and Chusonji temples are all representative works of the Fujiwara period.

(3) Architecture. Along with the development of Japanese style painting a new Japanese architecture, as seen in what they call the Shinden-zukuri (main building of a peer's residence), prevailed. This style gradually encroached on the domain of sacred structures, as is well exemplified in the Ho-o-do and Konjikido, above cited.

Within three hundred years after the country's adoption of a seclusion policy, an indigenous style characteristic of the Yamato race made the fullest possible development in all branches of art.

Kamakura Period Between the Emperor Gotoba and Emperor Godaigo the Kamakura Shogunate assumed the reins of government. The Kamakura period (1187-1340) of political history is at the same time that of Japanese art. During those 150 years traditional Japanese sentiments and thought developed vigorously, against the aristocratic culture which had gained influence in the previous period. Such a turn of cultural development could not but react on art ; the anti-traditional spirit of the age began to tell on artistic creation. Not only from within but also from without the country a radical change was introduced, because in those days the Yuan period succeeded the Sung in China ; and its highly favoured cultural attainments came dashing to the Japanese shores. The two movements, of foreign and domestic origin, combined to lay a foundation for modern fine art which started and developed in and after the Muromachi period.

(1) Painting. Continued civil wars, military administration, and

Digitized by Google

war literature, all contributed to the volumious production of yemakimono (picture-scrolls) based on themes from battle scenes. Another kind of yemakimono worthy of special mention was painted for the purpose of propagating the doctrines of newly risen sects of Buddhism, such as the Zen and Jodo. This pictorial demonstration of religious doctrines proved quite effective; for, by depicting the life and work of founders, a more direct appeal was made to prospective converts. For the same reason the yemakimono came to serve also as a means to propagate knowledge of the origin and development of a shrine. Quite a number of picture-scrolls of the period still remain in perfect condition, those reckoned among greater works being the History of the Kitano Tenjin Shrine, Murasaki-shikibu-nikki, Sanjurokkasen, Moko-shurai-ekotoba, Honen-shonin-gyojo-edzu. The last mentioned is a yemakimono depicting the personal history of Honen-shonin, the noted priest who founded the Jodo sect of Buddhism. Among scores of yemakimono painters, Nobuzané Fujiwara, Keion Sumiyoshi, En-i, Takakané Takashina and Yoshimitsu Tosa were the most popular. A further noteworthy event of the period was the rise of portrait painting. Generally speaking, until this period there was no other method for reproducing figures except by sculpture. The term for portrait was niseyé. But toward the end of this period a new mode appeared. The technique of portrait painting made rapid advance from the time of Takanobu Fujiwara, Tairano-Shigemori, Minamotono-Yoritomo whose works are treasured at the Shingoji temple, all rare masterpieces.

With reference to Buddhistic painting, the aforementioned Takuma school gradually improved in technique; and with the appearance of Shoga, a descendant of the Takumas, the Takuma school of Buddhist painting was founded, drawing a clear line between the old and new delineations.

(2) Sculpture. The Kamakura period was also a fecund age in the direction of sculpture. Compared with the work of the preceding period it appeals with more virility. The Shichijo-bussho, the most important sculptors' association or guild, which had been making steady progress, produced a group of consummate artists in Koei, Unkei, Jokaku, Kwaikei, Tankei, Jokei, Koben and Kosho, all contemporaries. Among them the most skilled were Unkei, Tankei and Kwaikei, who are recognized as the best sculptors since the time of Jocho. Whereas Unkei and Tankei excelled in producing the expression of passion, as in statues of nio (Deva kings), Kwaikei specialized in gentle, elegant figures, like those from the chisel of Jocho.

(3) Industrial Art. Lacquer-ware technique, too, made a remarkable advance. The art of engraving also progressed, especially with the appearance of the Kamakura-bori (Kamakura style of engraving). Technique in metal work, also saw much development, inheriting the characteristic virtues of the Fujiwara period. Up to that time native ceramic art was in so primitive a stage that only unglazed ware could be manufactured. After Kato Shirozaemon-Kagehisa returned from Sung, marked progress was made in this field, and fine chinaware became a home product.

(4) Architecture. The mansions of nobles had been built in the Shinden-zukuri style, but during the Kamakura period the Buké-zukuri style of architecture started and soon dominated. This is a simple, plain style with an unusual number

Digitized by Google

of sliding-doors to let in light. Though this style of structure has gone out long ago, one can get an idea of it through various yemakimono in which this style of architecture is represented. After the advent of the Zen sect of Buddhism under Eisai-zenshi from China, then called Sung, and the establishment of the Kenninji temple at Kyoto, Zen style of architecture came to attract attention. A good example of this style, still intact, is the Enkakuji temple at Kamakura.

Muromachi Period Succeeding the Kamakura age came the Muromachi period (1341-1580), which, after the two centuries and a half of civil strife, ended with the downfall of the Ashikaga Shogunate. In China the civil disturbances of the late Yuan dynasty had been brought under control by the rise of the Mings, resulting in the advent of the golden age of Ming culture, which exercised some influence on Japan.

(1) Painting. As was customary whenever Chinese culture attained its zenith, communication between the two countries, which had been on the wane, revived again, resulting in the gradual decline of yemakimono, portrait and Buddhist painting, handed down from the preceding Kamakura period, domestic art unable to cope with the powerful influence of Sung-Yuan style of painting in China. Early in this period there were not a few yemakimono worthy of note such as the Gosannen-gunki by Korehisa Fujiwara and the Yuzu-nembutsu-engi, joint work of Hiroyuki Tosa, Yukihidé Kasuga, Mitsukuni Fujiwara, Ryuko Awataguchi, Jakusai Rokkaku and Eishun Hogan. The latter still remains in the form of a coloured wood-engraving, perhaps the most widely known as our oldest example of this art.

Typical portrait work of the period is that of the Emperor Godaigo in the Daitokuji temple, Kyoto, and of Yoshimochi Ashikaga, at the Shingoji temple. Far more characteristic of the age, however, are the portraits of Zen priests or so-called "Chinso." The most typical chinso is, perhaps, the portrait of Seiichi-kokushi, painted by Mincho, preserved in the Tofukuji temple. Strictly speaking, chinso has more similarity to the Sung-Yuan style than to the Tosa school of portraits.

Buddhist painting of the Muromachi period may roughly be adjudged stationary. Copying of old works seemed to have been the only task attracting artists, among whom a priest named Myotaku-zenshi was known for skill in painting Acala pieces; the principal works of this priest-painter are treasures of the Imperial Art Museum. The most distinguished pictorial artist throughout the period, however, was Mincho. Among his works handed down to the present are the portrait of Seiichi-kokushi, above-mentioned, Gohyakurakan (five hundred disciples of Buddha) in the Tofukuji temple, and Dainehanzu, known as the largest painting in the country. In his brush work are ample traces of the style of the Sung-Yuan period in China; and he was, moreover, the leading painter of the age by whose art the Continental technique, introduced with the Zen sect in the Kamakura period, was digested, assimilated and consummated.

Special mention should be made of the advent of the Sung-Ming style in yamatoyé work, enhancing the traditional style of that art. This new movement was no doubt made possible by the Ashikaga policy of encouraging trade with China, then called Ming. In consequence, numerous Chinese works of art continued to be imported, greatly

Digitized by Google

stimulating the domestic art world. Among various merits and demerits then inherited from the Continent, kakemono (hanging pictures) and a more advanced technique in painting flowers and birds were perhaps the most outstanding. It is also a fact worthy of special mention that the Sung-Yuan style of sumiyé painting (black and white) became popular throughout Japan, under artists like Jasoku Soga, Sotan Oguri, Shinno Nakano, Sesshu and Masanobu Kano. These five sumiyé painters were talented pupils of Shubun who enjoyed the confidence of the Shogun and occupied an important position under the Shogunate government as a painter.

(2) Sculpture. Images of Buddha continued to be supplied by the Shichijo-bussho of which mention has already been made. But these products gradually lost their artistic value. The aforementioned Shubun was also a good sculptor. It is said of his skill that the great wooden statue, 40 feet high, of Amitabha, enshrined in the Unkyoji temple, was originally the work of a Nara sculptor, but was retouched by Shubun's chisel and improved.

(3) Industrial Art. In this epoch the development shown in industrial art was mainly due to the whimsical enthusiasm of the Shogun. Chanoyu (tea ceremony), a ceremonial etiquette genuinely Japanese, gave rapid rise to various branches of industrial art especially in fine porcelain, the climax of which was reached during the latter part of the period. This progress was not only in works of manual art like tea-cups, trays and so on, but in kakemono and tokonoma (alcove) furnishings of the tea-room, and the building itself, all of which are required for the full ceremony of tea-serving. Most of the teacups used for chanoyu in those days were of Chinese make, or imports from the South Seas.

(4) Architecture. The Zen style of architecture greatly improved. This combined with the cult of chanoyu, lent impetus to the construction of simple but tasteful habitations and temples, with gardens and arbours harmonious to the main building, well represented by the Kinkakuji and Ginkakuji temples in Kyoto.

Momoyama Period The thirty years that followed is termed the Momoyama period. During this comparatively short interval civil disturbances stirred up the whole country under the governments of Nobunaga Oda and Hideyoshi Toyotomi, acting as military dictators.

(1) Painting. Eitoku Kano was perhaps the greatest painter of the period. Nearly all the mural pictures in the castles of Azuchi and Osaka and the mansion at Shuraku are attributed to the brush of this famous artist. The peculiarity of the painting of the period lies in its grand scale and gorgeous, bright colouring. This is especially true of Eitoku Kano's work. Another noted landscape and ukiyoyé painter was Sanraku Kano ; in the Sesshu school of sumiyé were Kogan Unkoku and Tohaku Hasegawa ; the Tosa school had Mitsuyoshi who succeeded to the Tosa school which had by that time been reduced to a school only in name.

(2) Sculpture. The most striking feature of the Momoyama sculpture is its clever adaptation to decoration of architecture. Besides Hidari-Jingoro, whose fame as an accomplished sculptor and engraver still enjoys nation-wide popularity, there were skilled artists like Yuzaemon Miyanishi and Matayemon Okabé. As in the Muromachi period, the art of carving "No" masks came into vogue.

Digitized by Google

(3) Industrial Art. Metal work experienced remarkable improvement. The sword-guard artists evolved novel designs. Also in the technique of bronze casting no insignificant progress was made by casters like Yashichiro Hagoya, Dojin Nishimura, Yojiro Tsujido, Yayemon Nagoya and Echizen-no-Shojosansho. The current of the age could not but influence the art of raised lacquer, handed down from previous periods; now works on large scale, fit for the decorative purposes of architecture, began to dominate the situation. The Kannon-do of Chikubu-shima and the Kodaiji temple of Kyoto best represent the technique of this period.

Ceramics also were greatly enhanced in technique. Impelled by the nation-wide use of chinaware, due to the popularization of chanoyu, imported articles grew insufficient. As a natural consequence, home industry in this direction was greatly stimulated, resulting in Nagasuké Chojiro's invention of the rakuyaki style and Rokubei Mikazuki's bizenyaki style of ceramic ware. In the realm of textile art, what is to be noted is that in the Tensho era (1573) a new technique in weaving was introduced from Ming, China, and reached Nishijin, Kyoto, where it appeared in the form of Yamatonishiki, ito-nishiki, karaori-nishiki, kinran (gold brocade), donsu (satin damask), rinzu, and so on.

In conclusion it may be said of the art of the Momoyama period that, while developing such gorgeous and imposing structures as the Shurakutei and Momoyama Castle, it popularized the exclusive, austere and polite art of chanoyu. Thus two diametrically opposed arts developed all through the Momoyama period.

Yedo Period The Yedo period (1603-1867) started with the Tokugawa Shogunate in Tokyo, then called Yedo, and terminated with the downfall of that government just before the Meiji Restoration. During the 260 years of the Tokugawa Shogunate Yedo flourished, cultivating its own culture as against that of Kyoto, giving the country two centres of culture, one in the east and one in the west.

In the early Yedo period communication with countries beyond the sea opened and foreign trade was thereby greatly stimulated. Whereas Japan had hitherto had little or no dealing with Europeans, save Spaniards and Portuguese, Hollanders and Britons now began to come to her shores for commercial purposes. Relations with neighbouring countries also increased in intimacy, due to improved communication facilities. Nevertheless, the people were not satisfied with official passivity but extended their trade with Siam, Cochin, Tonking, Luzon. Furthermore, Iyeyasu Tokugawa, the first Shogun of that line, even attempted to trade with Spain and Mexico, sending envoys for that purpose. By this improved intercourse with foreign countries traditional Japanese art was greatly influenced. In the Kan-ei era (1644), Yemosaku Yamada first produced pictures in Western style painting. Fortunately or unfortunately, however, the third Shogun, Iyémitsu, with a view to stamping out Roman Catholicism pursued and imposed an isolation policy by prohibiting the entrance of all foreigners except Hollanders and Chinese. Under this high-handed policy the infiltration of foreign influence was almost completely checked, and domestic genius again came into its own, developing another golden age of fine art.

(1) Painting. The Kanos, who had flourished since the Muromachi period, produced skilled artists like

Digitized by Google

Yasunobu, Naonobu, Tsunenobu and Morinobu, all of whom had the honour of serving the Shogunate as official painters. But this special favour proved a cause of decline in the Kano school later. Among the foregoing four principal members of the Kano school, the last mentioned, Morinobu, was the most excellent, known by the pen-name of Tan-yu. Tsunenobu ranks next in artistic skill. The Tosa school, which had been waning in influence, recovered its laurels in the days of Mitsuoki who was promoted to the Emperor's service. In those days the Sumiyoshi school originated from the Tosa, and became firmly established under Jokei, younger brother of Mitsunori. Toward the close of this period an attempt was made for the rivival of yamatoyé, by Totsugon Tanaka, Ikkei Ukita and Tametaka Okada, among whom Tametaka Okada was pre-eminent. The yamatoyé of the Meiji and Taisho eras started from their work. Yosai Kikuchi is another painter of the group.

One of the greatest painters of the age was Korin Ogata whose art may be traced back to that of Sotatsu school which was originally a style of painting for decorative purposes. Under Korin were Kanzan, Shiko Watanabé and Hoichi Sakai. Their work suprised foreign eyes as a revelation of the peculiar excellence of Japanese art. Being used for decoration the work of the Koetsu school had close relations with textile, dying, ceramic and other technical industries of the time.

Ukiyoé, which for originality is one of the salient art products of the Yédo period, developed hand in hand with popular drama and popular literature. It is said that the Ukiyoyé or genré style of picture, was started by Iwasa-Matabéi-shoi; certainly he and Choshun Miyagawa, Shunso Katsukawa, Utamaro Kitagawa, Kiyonaga Torii, and Hokusai Katsushika are known as the most accomplished ukiyoyé painters. Of ukiyoyé there are two kinds, namely, hand-painting and colour-print. The latter form was most characteristic of the age. The black and white prints, started by Moronobu Hishikawa, were forerunners of beniyé, which is a coloured print made on coloured wood blocks, an engraved block for each colour. Before this printing process was adopted for mass production, brushes were used for colouring. At first two colours, red and green, were used for printing from engraved blocks, but Harunobu Suzuki later invented an improved process of printing in five colours, starting the nishikiyé which met with popular favour as time went on. Later, in the hands of masters like Utamaro and Hokusai, the process of colour-printing from wood-engravings saw marked improvement, until the finished pieces far surpassed the original hand-painted work in artistic value. Landscape prints in ukiyoyé style were started by the famous Hiroshigé Ando. Some people may look down upon ukiyoyé as vulgar art; but nevertheless it was art most true to the life of the Yédo period. In later years it was not seldom that European collectors of works of fine art were found ready to pay even several thousand yen for a sheet of mere colour-print. This was not without reason.

Special mention should also be made of the arrival of Ifuchieu, a painter of the Ching dynasty in China; for it was through this artist that the Nan-Sung literary school of painting was first introduced into this country. In the early days of the Nan-Sung style of painting, Nankai Gion, Hyakusen Sakaki, Taiga Ikeno and Buson Yosano were

Digitized by Google

its most excellent exponents. Later, with the rise of Chinese classics, the Nan-Sung literary school made great strides and its influence practically dominated the country, producing such noted names as Unsen Kushiro, Daizen Hirosé, Kaiséki Noro, Chikuden Tanomura, Kazan Watanabé, Aigai Takaku, Baikan Sugai, Hanko Okada, Chikudo Nakabayashi and Baiitsu Yamamoto, among whom Chikuden Tanomura was reputed the most excellent. Kazan Watanabé and Baiitsu Yamamoto enjoyed pupular favour next to Chikuden.

Buncho Tani became the most brilliant artist of the age, both in Pei-Sung and Nan-Sung styles of painting; he was a pupil of Kangen Kitayama who learned technique from Fei Hun-yuan and Chu Ko-chin who entered Japan during the Ching dynasty of China. There were some other very important painters, too, namely, Rikyo Yanagisawa, Jakuchu Ito, Sosen Mori and Ganku. Especially popular were the pictures of domestic fowls by Jakuchu, and monkeys by Sosen.

An important event, moreover, was the appearance of the Maruyama school with Okyo Maruyama as its founder. Okyo's style was derived mainly from Ming and Ching paintings, and developed into what resembled sketches. His pupil, Goshun Matsumura, established the Shijo school, which in later years grew to be as popular as the Maruyama school. By these two styles the Kyoto world of pictorial art was dominated.

(2) Architecture. The Momoyama architecture of the preceding period developed into a far more elaborate style, and with more elegance. This elaborate rococo style of Yédo architecture had less value as fine art than as mere decoration. Examples of the architecture of this period are found in the celebrated buildings at Nikko, which, as everybody can recognize, are more worthy to be called an excellent decoration than an excellent example of fine art.

(3) Sculpture. Although there is not much to be said about the sculpture of this period there are yet two outstanding instances that exemplify the use of Chinese carving; there are the Mampukuji temple at Uji, by a Chinese, Ingenzenshi, and the art of Zen-shu-chokoku (Zen architecture), by a Buddhist sculptor, Fan Ton-sheng, from Foochoo, China.

(4) Industrial Art. Both manual and industrial art greatly advanced in technique, and metal, textile, dying, lacquer and ceramic industries flourished like all sorts and varieties of flowers. A Chinese introduced from Ming the process of decorating ceramics with brilliant colours or in gold or silver. And through the efforts of Kakiémon Sakai and others the famous Arita and Imari potteries were founded. In this field of fine art the name of Jinsai Nonomura should be remembered, for he occupied the highest position. Cloisonne ware also experienced a remarkable promotion in technique, along with other branches of industrial art.

The time arrived at last when the people awoke from their age-long sleep, with all doors closed to foreigners. Besides Hollanders, came Russians, Britons, Frenchmen and Americans, in spite of the national agitation to keep the country shut against foreign intercourse. Already from Holland Western learning and art had percolated in through Nagasaki. Oil painting in Western style was attempted by Gennai Hiraga. The new style of painting spread far into the country even to Akita prefecture, and reached consummation under Kokan Shiba later. Thus towards the close of the Yédo period

Digitized by Google

the urge of Western art reached Japanese shores in great force.

Meiji Art The modern age in the history of Japanese fine art started over 60 years ago when the Emperor Meiji established Imperial government in Tokyo. The Oriental fine art, which first sprouted in Mesopotamia, made eastward advance blending with Indian and Chinese art until it at last reached the Far East and established its central influence in Japan.

(1) Architecture. With the Meiji Restoration came a turning point in our history; the country was opened to free foreign intercourse, followed by the inflow of European culture like a flood. Western civilization soon began to exercise an overwhelming influence all over the country, and eventually everything foreign met with enthusiastic popular favour. This phenomenal change in the country directly influenced architecture; and European-style of structures sprang up here and there. Even in the Japanese style of building were mixed Western modes of architecture. These radical changes in the architectural world of Japan had no small influence on other branches of our fine art.

(2) Japanese Painting. In the early part of the period Nan-Sung literary painting still prevailed, supported by Kyou Hodachi, Koseki Nakanishi, Shoka Watanabé, Gokaku Hirano, Rozan Yasuda, Soun Tasaki, Yukoku Noguchi, Aizan Taniguchi, Watei Taki, Chokunyu Tanomura, Seiko Okumura, Kampo Araki, Shohin Noguchi and others.

It so happened that in the 11th year of Meiji a certain American professor in the chair of philosophy at the Tokyo Imperial University, being charmed with Japanese paintings such as the ukiyoyé and Kano and Tosa work, proposed to start a movement for the preservation of these schools of art. In conformity with Professor Fenollosa's suggestion, the Government, in the 21st year of Meiji, established the Tokyo Fine Art Academy. As a result of the movement, the old schools of Japanese style of painting revived and a number of painters regained influence, of whom the more distinguished were Hogai Kano and Gaho Hashimoto of the Kano school; Kangyo Morizumi, Kangi Yamana, Mitaté Kawabé, Fuko Matsumoto of the Tosa school; Zeshin Shibata, Kansai Mori, Bairei Yukino, Gyokusho Kawabata, Keinen Imao of the Maruyama school; Chikudo of the Kishi school; Honen Tsukioka and Gekko Ogata of the ukiyoyé school.

In the 40th year of Meiji the first art exhibition was opened by the Education Office; and since that time it has been held once every year, greatly stimulating the resurrection of traditional Japanese art. The Tokyo circle of Japanese style painters was represented by Taikan Yokoyama, Kanzan Shimomura, Kogyo Terasaki, Gyokudo Kawai, Tomoné Kobori, Jippo Araki, Suiun Komuro, Somei Yuki, Kiyokata Kaburagi, Reika Yoshikawa, Eikyu Matsuoka, Hyakusui Hirafuku and Keigetsu Matsubayashi; while in the Kyoto circle were well-known painters like Kokyo Taniguchi, Hobun Kikuchi, Seiho Takeuchi, Shunkyo Yamamoto, Kako Toji, Keigetsu Kikuchi and Suisho Nishiyama. All of these east-and-west leaders displayed great activity in nurturing the Japanese style of painting as we see it today.

(3) Western Painting. Towards the end of the Yedo era the foundation of the Occidental style in painting had already been laid by Kokan Shiba and Dezen Aodo; and now came Togai Kawakami, Yuichi Takahashi, Horyu Goseda, Hosui Yamamoto, Shinkuro Kunisawa, Chu Asai,

Digitized by Google

Shotaro Oyama, Kiyowo Kawamura and Naojiro Harada, for whom the former foundation work became the basis for a new start. In the early Meiji days, English and Italian painters came to give lessons at the fine art department of the Tokyo Imperial University. Later, in the 21st year of Meiji, the Meiji Bijutsukai was founded for the purpose of enhancing the Western style of painting. It was, however, not until Kiyoteru Kuroda returned from France and opened a department for Western style painting in the Tokyo Fine Art School, that the Occidental mode really became established. Important artists in the new style in those days were Saburosuké Okada, Eisaku Wada, Takeji Fujishima, Kotaro Nagahara, Mankichi Kobayashi, Fusetsu Nakamura, Kunishiro Mitsutani, Sanzo Wada and Kunzo Minami. The models set by these great painters still prevail to-day, but will in future be more subjected to the influence of the Japanese style before reaching consummation, just as the Japanese style will assimilate Western motives and technique as it keeps on its forward march.

(4) Industrial Art. The ceramic industry made rapid advancement after the arrival of Wagner from Germany with a new technique; and with the help of Kozan Miyagawa, Yohei Kiyokazé, Dohachi Takahashi, Rokubei Shimizu and Sobei Kinkozan. In recent years Hazan Itaya, Rokubei Shimizu and Ichiga Numata have won distinction in this sphere of art. During the Meiji era, fine cloisonne was manufactured and exported in abundance. Metal work also developed to a remarkable extent, producing a number of skilled artists. In the domain of lacquer and dying industries no less improvement brought Japanese industrial art to the verge of its golden age.

The tendency of Western countries to vie with one another in holding Japanese art exhibitions amply endorses the international value of Japanese art.

(5) Sculpture. Upon opening the Tokyo Fine Art Academy, Kyuichi Takeuchi and Koun Takamura gave lessons in traditional Japanese wood sculpture. Western style sculpture was also taught, by an Italian instructor in the academy, side by side with lessons from Shukei Naganuma who had returned from Italy, followed by Fumio Asakura, Taimu Tatehata, Seibo Kitamura. From Koun Takamura and Kyuichi Takeuchi we come down to Choun Yamasaki, Unkai Yonehara, Denchu Hirakushi, Shin Naito. In the Meiji era the rise of ivory carving was also conspicuous, producing engravers like Gyokuzan Asahi and Komyo Ishikawa.

What helped the phenomenal ascendency of all branches of art were the Bunten (Education Office's art exhibition) which later came to be called Teiten (Teikoku Bijutsuin art exhibition), and the Inten (Nihon Bijutsuin art exhibition). Besides, there were and are exhibitions held by many other smaller groups of painters. From the viewpoint of art, it is not too much to say that Japan is to the Orient what France is to Europe.

Present Day Art

The period since the close of the Meiji era has been no less remarkable in the art history of Japan than the previous period, evincing brilliant activity in every direction. Since 1919, when the Imperial Art Academy was established, a systematic movement in the art world of Japan has been promoted. During the Taisho and Showa eras many

Digitized by Google

institutions and organizations have been created, and new schools successively introduced from Western countries, especially from France, Germany, and Italy. Western-style painting, coming first under the sway of French impressionism, and later passing through many stages of European influence, has produced vigorous and progressive artists who are thinking hard and exploring the furthest reaches of European pictorial thought. They have already reached the level of their Occidental benefactors, in technique. At a time when all the visual arts, if not all others as well, seem to be aspiring towards Occidental ideals of art, it must yet be noticed that our native art traditions are still retained, and characterize all works of purely Japanese fine art, with its classical rhythm and beauty.

Japanese-style Painting There are now in this country various exhibitions of Japanese-style paintings held by many institutes, wherein members are always seeking to achieve a more perfect expression of their ideals through traditional form and long-fostered technique. In the earliest stages of modern Japanese art, Kakuzo Okakura and other leaders, entertained this ideal, along with a number of artists and art societies, as well as such pioneers in our art-world as Hogai Kano or Gyokusho Kawabata ; and they joined efforts in the development of this school. Recently the art produced by their efforts has, in other hands, begun to degenerate into merely lifeless, mechanical work ; and Western realism, instead of the old traditional method, is gaining gradual influence among painters. But in spite of the struggle between Orientalism and Occidentalism in technique, the art workers in Japanese style are still vigorous.

The "Teiten" or Imperial Fine Art Academy Exhibition, which includes various Sections of Fine Art, in 1931 celebrated the 25th anniversary of its establishment. As the only art exhibition under management of the Government, it has, since its foundation, been exerting a profound effect upon this sphere of art, along with the Institute of Japanese Art (Nihon Bijutsuin), which is a private institution established specially for Japanese-style paintings. This was organized in 1898 under direction of Kakuzo Okakura and Gaho Hashimoto. These two institutes have continued to hold an exhibition every year. They have given birth to works of admirable achievement and merit, under such masters as Seiho Takeuchi, Taikan Yokoyama, Eikyu Matsuoka, and Hyakusui Hirafuku, all of whom are contributors to the native school.

On the other hand, there are other painters who also produce extremely creditable work, bringing out the profundity of the Oriental spirit and rising high above the conflict between Japanese traditionalism and Western realism. They are all grouped in organizations. Seison Maeda, Yukihiko Yasuda, Usen Ogawa, Sofu Nagano and Reimei Mamichi belong to the Nihon Bijutsuin ; and Somei Yuki, Eikyu Matsuoka, Tsusen Ogiu, Ren Yamada, Shokin Katsuta, Nanyo Inui, Katsuji Koizumi, Ryuko Tsutaya, Gengetsu Yazawa and Saiten Tamura comprise the Japanese Painting Society (Nihon Gakai).

In the Kansai district, the Free Painting Society of Japan (Nihon-Jiyugadan) was organized by certain artists grouped in Kyoto, which has in itself special significance for lovers of genuine Japanese art. The members are Keisen Ikeda, Bunto Hayashi, Keigaku Nishi, Kokan Watanabé, Shunki Tamaya, Manshu Ueda and other painters. The num-

Digitized by Google

ber of talented painters is too numerous to mention, but the following are well known : Buzan Kimura, Yukihiko Yasuda, Kokei Kobayashi, Insho Domoto, Kwansetsu Hashimoto, Heihachiro Fukuda, Seison Mayeda, Shokan Taichi, Keisen Tomita, Gakuryo Nakamura, Kampo Arai, Koka Yamamura, Tokan Fudeya, Sofu Nagano, Seisui Hashimoto, Usen Ogawa, Tsunetomi Kitano, Gyoshu Hayamizu, Koichiro Kondo, Seiju Komoda, Eiho Hashimoto, Kahaku Kobayashi, Chiyuki Sakikura, Nampu Katayama, Sanryo Sakai, Fudo Tomitori, Taigetsu Koyama, Taigyu Okuma, Kiyokata Kaburagi, Fumio Tanaka, Ryushi Kawabata, Toyoshiro Fukuda, Isso Sakaguchi, Rofu Ochiai, Shumpa Kawaguchi, and Keimei Anzai.

Western-style Painting It is not too much to say that the striking progress of Western-style painting is chiefly owing to the efforts of the Nikakai members, who, dissatisfied with the purely academic tendency of the Imperial Fine Art Academy, freed themselves from its restraint, and organized a society of their own. The Nikakai was organized in 1913 by an active group of rising painters of fresh and advanced ideas, the members being Ikuma Arishima, Yuzo Fujikawa, Hakutei Ishii, Morichi Kumagai, Jutaro Kuroda, Tokusaburo Masamuné, Katsuyuki Nabei, Kigen Nakagawa, Hanjiro Sakamoto, Shintaro Yamashita, Sotaro Yasui, Haruyé Koga, Seifu Tsuda, Seiji Togo, and foreign painters, André L'Hôte and Zadikine. In 1922 was founded the Shunyokai by Misei Kosugi and other artists who had formerly been associated with the Western-style painting Section of the Institute of Japanese Art, but who had seceded from it, together with Ryuzaburo Umehara. The other members are Hakuyo Kurata, Noboru Hasegawa, Kanaé Yamamoto, Gen-ichiro Adachi, Shohachi Kimura, Tsuruzo Ishii and Ippei Okamoto. The Pacific Art Society, the oldest Western-art organization of the Meiji era, was established in 1905, and with them instruction in Western-style painting was first begun. Toraji Ishikawa, Banka Maruyama, and Kunishiro Mitsutani were conspicuous collaborators.

The Kaijusha was formed in 1924, supported by such able painters as Juji Kanazawa, Itaru Tanabé, Soshichi Takama, Sakujiro Okubo, Yoshihiko Kumaoka, Yori Saito and other artists.

In 1930 the Independent Art Association was founded by certain extremists in the art-world, like Katsuzo Satomi, Zenzaburo Kojima, and nine other members of the Nikakai, who had been dissatisfied with the mannerism of that society and left it. The new body consisted of 13 congenial artists, who aimed at working for a new art movement, by opening up a fresh course for students of Western-style. The painters of note in this group are Moriichi Kumagai, Kinzo Kuniyeda, Haruyé Koga, Tokusaburo Masamuné, Katsuyuki Nabei, Kigen Nakagawa, Hanjiro Sakamoto, Seifu Tsuda, Reiichi Yokoi, Giken Kinoshita, Kanemitsu Hamada, Shogo Taguchi, Genichiro Adachi, Noboru Hasegawa, Shohachi Kimura, Misei Kosugi, Hakuyo Kurata, Issei Nakagawa, Ippei Okamoto, Zennosuké Tanaka, Shozo Yamazaki, Kanayé Yamamoto, Kotaro Takamura, Sadao Tsubaki and Tsusei Kono.

In addition to these societies, there are some minor organizations such as the Hakujitsu-Kai, the Japanese Painting Society (Nihongakai), the Creative Print Association of Japan, and the National Art Association, all of them no less remarkable than the Societies previously mentioned.

Digitized by Google

Sculpture For the promotion of plastic art, there are many organizations which contain, each of them, sculptors of distinction. Besides the "Teiten" and the "Nikakai" which have also Sculpture Sections, there is the "Kozosha", organized in 1926, for study in the various branches of plastic art. It is supported by Sogan Saito, Jitsuzo Hinako, Saburo Hamada, Miézo Shimizu, Kanji Yo, Taménari Hirai, Minato Kozu, Takézo Sato and other artists. It can hardly be denied that this sphere of art, on the whole, does not show such brilliant activity as other similar organizations.

Other sculptors of note are Denchu Hirakushi, Hakuréi Yoshida, Chozan Sato, Koyu Fujii, Tsuruzo Ishii, Ryumon Yasuda, Takéshiro Kita and Takézo Shinkai.

Applied Art Our applied arts have developed in their own way, giving birth to many works of really admirable craftsmanship, some being of more artistic merit than those of Europe. At every exhibition, various branches of applied art are represented. Many artists, some using all their traditional technique, or others creating wholly new forms, are striving to satisfy the demands of present-day life. The Fine Art Association of Japan is a leading organization, having Hozuma Katori, Kéigi Nakata, Choun Yamazaki, Shunzan Yagioka, Hiromi Minakami, as directors.

Other prominent artists in this sphere are: Nobuo Tsuda, Kamézo Shimizu, Shisui Musumi, Eiichi Ishida, Kiyoshi Unno, Séizan Kawamura, Kanémi Uyématsu, Sozan Sawada, Tozan Ito, Shuétsu Sakita, Senroku Kitahara, Shodo Sasaki, Héizo Tatsumura, Andon Yamamoto, Séika Yamaga, Kozan Miyakawa, Ichiga Numata, Kanjiro Kawai, Yoséi Tsuchiaki, Joun Oshima, Hankichi Kiuchi, Hoshu Takamura, Kado Sugita, Hakusai Okuni, Shumin Funabashi, Koshun Katsura, Gonroku Matsuda, Ryushin Umézawa, Séimi Yotsuya, Mia Isozaki, Ryuzan Ishino and Chibun Onojima.

Architecture After the earthquake and fire of 1923, Tokyo and other cities witnessed the erection of many new buildings; and almost all these structures reveal a lively modernism under the influence of European styles, though some are more or less marked by national-classical characteristics. At present, Japan has acquired the modern mentality for steel and reinforced concrete; and many buildings in Japanese cities are as large and expensive as those in America. On the other hand a dozen or more able architects are thinking out greater possibilities in the adoption of newer European styles of architecture. Already in the new Mitsui Bank and the Mitsubishi Bank, as well as in many other new buildings, Japan can show imposing examples of architecture unsurpassed for art and utility by any other country.

The 1934 Exhibitions

The 9th exhibition of the National Painters' Society was opened on April 22, 1934, in the Tokyo-fu Art Gallery. The number of paintings sent in for examination reached 1,738 (Western painting 1,064; block colour-print 223; industrial art 298; and sculpture 153). The accepted works were 232 or Western painting 64, block colour-print 26, industrial art 115, and sculpture 27. There were found 34 new persons among the accepted.

The submitted works to the Shunyo-kai Art Exhibition which was opened on April 21, 1934, in the Tokyo-fu Art Gallery in Ueno Park numbered 1,800, of which 230 were accepted. Among the 31 new paint-

Digitized by Google

ers the name of Mr. Salvatolle Melzeh was found.

The 21st Nika-kai exhibition was opened on September 3, in the Tokyo-fu Art Gallery at Ueno. The number of works submitted was 4,033 (3,868 Western paintings and 165 sculptures). The number of Western paintings accepted was 376 and that of sculptures 39. Among new admissions there were two Chinese young painters, Li and Kwan who were born in Shanghai.

The 21st Nihon Bijutsuin Exhibition (Inten) was opened on the same day and in the same building with the Nika-kai, the number of works submitted was 812, of which 51 (23 new) Japanese paintings and 54 (8 new) sculptures were accepted.

Inten and Nika both closed their exhibitions on October 4. The continuous rain, quite unusual for the season of the year, held back visitors. The total number of visitors to the former was 45,000, decreasing 7,000 as compared with the previous year, while that of the latter was 30,000, decreasing 6,000. The number of works sold was correspondingly small, i. e. 16 in the Inten Exhibition and 6 in the Nika.

The 15th Teiten (Imperial Academy of Fine Arts) Exhibition was opened on October 16 and closed on November 20, the résume was as follows :

	Works submitted	Works accepted
Japanese painting	1,845	264 (48 new)
Western painting	8,398	225 (50 „)
Sculpture	455	152 (22 „)
Industrial art	1,097	214 (53 „)
(Japanese sword)	(118)	(14)

Art Museums

A list of the more important art museums follows :

1. Tokyo Imperial Household Museum : Ueno Park, Tokyo ; open daily from 9 a.m. to 4 p.m. Departments : Art and History.
   Officials. President : Eisaburo Sugi ; Manager : Masaaki Yajima.
2. Imperial Household Museum at Nara : In Nara Park ; open daily from 9 a.m. to 4 p.m. ; closed from Dec. 25 to Jan. 5.
   Departments : History and Art. Director : Gunichi Wada.
3. Kyoto Onshi Museum : In Shichijo, Kyoto ; open daily from 9 a.m. to 4 p.m. ; closed from Dec. 25 to Jan. 5. Departments : Art and History.
   Officials. Director : Fujio Wada ; Advisors : Torajiro Naito and Yasunosuké Seki.
4. Chokokan : In Uji Yamada, Mié. Director : Kotaro Sakamoto.
5. Reihokan : At Koya-san, Wakayama. Director : Chito Izumi.
6. Treasure house, Kanshin-ji : In Kanshin-ji-mura, Minami-Kawachi-gun, Osaka.
7. Treasure house, Koryuji : At Uzumasa-mura, Kadono-gun, Kyoto.
8. Reihokan, Ninnaji : At Omoro, Kadono-gun, Kyoto.
9. Museum of the Faculty of Letters, Imperial University, in Kyoto.
10. Kankokan : in Hiroshima.
11. Treasure house of the Itsukushima Shrine : At Miyajima, Hiroshima.
12. Kokuhokan : at Kamakura.
13. Sanda Museum : at Sanda, Arima-gun, Hyogo.
14. Governmental Museum : at Seoul, Chosen. Manager : Ryosaku Fujita.
15. Keishu Museum : in Keishu-gun, Keisho-hokudo, Chosen. Manager : Hideo Moroshika.
16. Prince Li's Museum : in Seoul, Chosen.
17. Kanto-cho Museum : at Port Arthur, Kwantung Province. Director : Naomiki Hirose

Music

The First Period

Primitive Music The development of Japanese music may be divided into four periods. The first period originates in prehistoric times and ends about the reign of the Empress Suiko (592-627 A. D.). This is the music of the ancient Japanese (Yamato), and is here named, for convenience, primitive music. To regard the music of this stage as primitive may seem inappropriate, because towards the close of the 6th century Yamato civilization had advanced quite beyond primitive culture. The word primitive is applied here because, although music should show some development of artistic form, no such form was known in the music of this period. Compared with the music of the period that followed, a striking difference is noticed.

The Second Period

Introduction of Foreign Music The second period started about the end of the Suiko régime in the 7th century, and continued till about the end of the Heian period, at the close of the 12th century. The characteristic feature of this period lies in the building up of Japanese music upon a foundation of Chinese, Korean and Indian music, which possessed a markedly advanced form and was then being freely introduced into our country.

(1) The First Half. In the first half of this period imported music was imitated. Music was first introduced from Korea (Chosen), then from India and lastly from China. Of the three, only that from China continued to come freely thereafter. The Chosen music then imported was widely different from the music introduced from China and India, especially in the degree of its evolution. But even such undeveloped music as that of Chosen (then called Sankan), was far more advanced than Japanese music. It is, therefore, but natural that there was an abysmal difference of standard between the Japanese music of the early period and that later imported from China and India. Moreover the early models were monopolized by the nobles; the masses could not share the privilege of enjoying the advanced art but had to be content with the same old primitive music. For two to three hundred years this state of things continued, until the reigns of Emperors Saga and Nimmei when genuine Japanese Court music, called gagaku, came into vogue. But even this home-made gagaku was of foreign origin too.

(2) The Second Half. During the second half of the second period, foreign and domestic music became harmonized, producing a new Japanese style in vocal music. Founded on the imported music staff, the vocal music of this period can not be compared with the purely national music that prevailed in a later period. The varieties then developed were kagura, saibara, roei and imayo, all of which can be included in the following two groups:

(a) One group was modelled after foreign music but set to the key of Japanese music of the primitive age; and hence the reconstruction thus effected in ancient Japanese music was only in form. The most conspicuous examples are the kagura, azuma-asobi, Kumé-uta and yamato-uta. No doubt the kagura existed in the prehistoric age, as may be inferred from Japanese history, but not until past the middle of the Heian period did it appear in the regular form of music. The kagura is a sacred dance with music,

Digitized by Google

practised on the stage of a shrine at village festivals. The kagura now observed, however, is fundamentally different from that staged in those days; it saw marked development in the Heian period. In the early days of the sacred kagura dance it adopted so primitive a form of vulgar indecency that it could not be performed today.

During this latter part of the second period all the other three branches of music, namely, azuma-asobi, Kumé-uta and yamato-uta, were also practised at shrine festivals. Originally they had no relation with shrines, the first two having developed from folk-songs, and the third from a war-song sung during the triumphant expedition into Yamato under the Emperor Jimmu. The adoption of those folk-songs in the rites of sacred festivals was made possible by the advanced music of foreign origin employed at Buddhist temples; better music also became indispensable at Shinto shrines in order to rival the advanced Buddhist music. Unlike Buddhist temples, the Shinto shrines hesitated to make use of imported material; and so they had no alternative in those days but to improve their music on the ancient models of the country. The principal instruments employed for this purpose were the six-stringed Japanese koto and the six-holed kagura flute, remodelled.

(b) Those modes that come under the category of the other group are the saibara, roei and imayo, which were combinations of imported and Japanese music then in vogue. As regards saibara, it is believed that it was a sort of folk-song that prevailed in the Nara period, but the sihara, a folk melody of the Nara period, can not be compared with the saibara which was an artistic vocal song of the Heian period; in form they are widely apart. The saibara in the Heian period was in fact an artistic product. These branches of music served for the amusement and diversion of nobles, and had nothing to do with religious services. They were exclusively of foreign origin in form.

The Third Period

Seclusion of Domestic Music The third period begins with the Kamakura era and terminates towards the close of the Tokugawa Shogunate, or from the beginning of the 13th century to the middle of the 19th century. A characteristic of the period was its seclusive tendency in music. By the term seclusive music, however, is not meant national seclusion, but that music, like other arts, throughout the period, was driven into seclusion in consequence of incessant civil war in Chosen and China, which prevented its development in Japan. Save for the material brought back by priests from China no foreign culture entered Japan during that age; and it is for this reason that the term seclusive represents the third period. Characteristic features of this third period are seen in the relations of music with literature.

(1) Music and Literature. As a natural result of the interruption of intercourse with continental civilization, the influence of the Japanese language made itself felt on music, so much so that in form music seemed to belong to language, both evolving together; in fact, story and song became the essential requirements of music.

(2) The Range of Influence. Next, the range of influence of each school was narrowed, until such forms as kiyomoto, joruri, shinnai and itchubushi became representative during the third period, but each of them was cultivated in a limited locality and time. In this connection joruri

Digitized by Google

was most conspicuous, because, based entirely on the national literature, it appealed only to the people who understand the language used. Kiyomoto music thrived in Yedo, joruri prospered in Osaka, and itchubushi flourished in Kyoto. Thus in the third period none of the music born and popularized was of national to say nothing of international character but was limited to a certain locality. This, however, is by no means a proof of retrogressive tendency in music; for the harmony thus realized between Japanese literature and music was no meagre advantage. It was natural too, for in the evolution of art song is older than speech, poetry than prose.

(3) Music and the Military. Then there was the relation of music to military administration. The government was in the hands of feudal lords. In the preceding period music was regarded as a means of culture, and treated as such by the leisured class, because, among the nobles, proficiency in this art constituted an essential element in anyone aspiring to be a man of character. Under the feudal lords, however, asceticism rose to influence among the samurai class, and music was looked down on as no more than a mere luxury which military men should despise as effeminate. This trend of the times gradually transferred music from the control of the nobles down to the lower orders of the community. This is why samisen music did not develop among the upper class but the lower stratum of society, where it thrived. The exclusion of samisen music by the intelligentsia was a glaring defect of the military administration. Naturally all branches of music in those days had to develop on the basis of popular knowledge and common sense.

Although civil strife is a great deterrent to the art of music, this was not so true in Japan as in China, for in Japan the Imperial household, whose existence and dignity suffered practically no change on account of the new military government, music was encouraged in Court circles. Then again it was protected and cultivated by priests; new music was fostered especially by Kamakura priests. The Heiké Biwa originated and developed under priestly auspices; and the shakuhachi music was introduced from China and popularized in the Buddhist domain, also through their efforts. The shakuhachi music now in vogue had its origin in this period.

The Muromachi Era The Muromachi era, sandwiched in between the Kamakura and Tokugawa eras, corresponds to a middle third period in the history of music. Between the Kamakura and Muromachi Shogunates a striking difference is noticeable in that, while a military administration was possible under the former, it was denied to the latter. Beginning with the Muromachi era the Ashikagas removed the Shogunate from Kamakura to Kyoto. Since Kyoto was the seat of the Imperial household, the officials who were military men could not do without etiquette in their association with Court officials of the Imperial household. They had to be familiar with the art of flower arrangement, the tea ceremony and the yokyoku music of the lyrical drama, or No dance. Thus from the necessity of studying these arts of social etiquette, military men had to approve and promote them. The introducers of the No dance were priests who returned from China, and used this sort of drama for moral or religious purposes, like the miracle and morality plays in England. The No dance was probably derived from something similar in China.

Digitized by Google

Early Yedo Era The last period begins and ends in the early Yedo era. All through this period popular music prevailed; the samisen, a popular musical instrument introduced into the country towards the end of the Ashikaga era, rose to great influence. Naturally, therefore, such popular music as the joruri, nagauta, kouta and hauta developed rapidly; they were especially popular among merchants and artisans.

The samisen was not only a representative musical instrument throughout the Yedo era but also occupies a most important position in Japanese music today. This three-stringed Japanese guitar has now come to enjoy worldwide recognition as an advanced musical instrument. Nearly 400 years ago, toward the end of the Muromachi period, it arrived in the country through the Ryukyu islands and is supposed to be of Spanish or Chinese origin. Compared with the sho and biwa, imported in the 5th or 6th century, the samisen is a thing of but yesterday. Yet it is found everywhere in Japan as an accompaniment to vocal music.

The Fourth Period

Internationalization of Japanese Music The fourth period covers the Meiji and Taisho eras (1868-1926) when domestic music rose to join the world current of music. The people awoke from their long slumber throughout the isolated Yedo era, and exchanged anti-foreignism for free intercourse with the outside world. With this epochal open-door movement came the Meiji Restoration which eliminated the Shogunate and restored the old Imperial régime. In obedience to the august wish of the Emperor Meiji all welcomed the introduction of the supposedly more advanced European civilization. Music was no exception. European music then imported was enthusiastically imitated all through the period. Production of imitative art was not the only task assigned to that age, for side by side with the movement the reconstruction of native music occupied the serious attention of musicians. A similar tendency is noticeable in and about the Nara period in the 8th century, when advanced ideas, imported from the continent, afforded models on which the ancient music of the country was reconstructed. Yet, a great difference is evident between that and the movement now under review; because, whereas in that day home music still lingered in the primitive stage and imitation of alien models was effected only with extreme difficulty, improvement in the native music of the Meiji era was so easy a matter that reconstruction could be carried out by mere importation of new staffs. This fourth period, which corresponds to the Meiji and Taisho eras, can be studied from three points of view, with reference to the development of the art.

(1) Innovations in Traditional Music and Revival of Ancient Music. In the Yedo period the development of music in form was insignificant, because importance was placed on expression of sentiment. People who realized this defect in the traditional Japanese music, agreed on the necessity of introducing radical innovations in this direction. This new movement was responsible for the stimulus given by the extensive introduction of European music, which in form was far superior to Japanese. Up to about the 16th year of Meiji considerable effort was expended towards eliminating this defect. As a practical attempt to attain this object, a movement was created for reconstruction work on the form of sho music which had deplorably degenerated in the Yedo

Digitized by Google

era, due to the influence of samisen music then at the height of popularity. The rise of the Yamada school in Tokyo is an example. Shakuhachi music likewise could not escape being influenced by the reconstruction current of the times.

For revival of ancient Japanese music the Gagaku Bureau was created in the Imperial Household Office in the 3rd year of Meiji. A large number of authorities on gagaku became officials of the bureau and strove to effect reorganization of the ancient music of Japanese parentage. These Court musicians set about composing new music out of gagaku, for use in elementary schools. The national anthem, Kimigayo, is a product of that bureau. Precisely speaking, Kimigayo ought to be played in gagaku, but, instead, it has come to be rendered with European instruments; for in those days they were the only musical instruments in educational institutions. Kibigaku, which is still popular in the Kansai district, is a form of gagaku somewhat vulgarized, at the time, by Hoshu Kishimoto, an Okayama musician.

(2) Diffusion of European Music. One of the outstanding features of musical development in the Meiji and Taisho eras is that Japanese musical education was placed on the foundation of European music. The introduction of European music into Japan can be traced as far back as the entrance into Japan of Christianity. This, however, had been monopolized by the introducers themselves in their respective localities of influence, until in the 2nd year of Meiji it entered the capital for the first time. In this year Japanese soldiers learned military band music from an English naval band master at Yokohama, which is perhaps the first instance of our official use of European music. Soon afterwards, in the 5th year of Meiji, both army and navy bands were inaugurated. Later, in the 12th year of Meiji, an investigation commission on school musical education was established in the Education Office. A commission, headed by Mr. Shuji Izawa, conducted inquiries as to the best method of teaching European music in Japanese schools. In the following year the Education Department invited an expert from America, and, under his superintendence, made music a part of elementary school education. Three years after, the Tokyo School of Music was established. This briefly is but an outline of the growth of European music in Japan during the Meiji era. It was mainly due to Government encouragement that European music was popularized in Japan much earlier than generally expected. But, for sounder and more thorough instruction in European music we must look to the era of Taisho. Rapid progress of music in the Taisho era was made possible principally in the following ways:

(a) Propagation by Gramophone. This invention enabled inhabitants of even the remotest corners of the island Empire to appreciate the great foreign music masters.

(b) European War and Visiting Musicians. At the outbreak of the European War many well-known musicians of the West went to America and Oriental countries in order to avoid being involved in the turmoil, and to find appreciation of their music in more peaceful environment. These world-famous musicians gave a number of concerts in Japan, and thus afforded us an opportunity to hear the best music the world can produce. So fortunate an event contributed much toward cultivating a taste for music in this country. Not long afterwards came radio, also from the West; and, like

Digitized by Google

the gramophone, radio also greatly helped the public towards a more intelligent appreciation of European music. This musical instrument, however, should be regarded as more properly belonging to the present era of Showa.

(3) Internationalization of Japanese Music. The diffusion of the knowledge of European music demonstrated to us its international qualities, systematized form and aesthetic structure. The vast difference between this international music of the West and Japanese music which is but national, served to spur on the reconstruction movement among the Japanese interested in music. The movement originally started in the middle of the Meiji era, but at that time it had no fixed goal at which to aim. Now, however, renewed ambition moved in three definite directions:

(a) The attempt to harmonize European instruments with the rhythm of Japanese music was laudable, but this seems to have been confined only too largely to Japanese students of European music.

(b) The movement to produce European rhythm with Japanese musical instruments, such as the samisen, sho and shakuhachi, was the task of those musicians who specialized in domestic music and who were yet familiar with modern ideas.

(c) A scheme to create a grand symphony orchestra of mixed foreign and domestic instruments was studied and tried by a few accomplished musicians, but the success or failure of the attempt is a question of the future.

Latest Developments

European Music (1) Schools. The Tokyo Academy of Music, established in the early Meiji era, still flourishes as the only government institution of the kind. Most of the teachers are now Japanese. Leo Sirota is an instructor of piano, and Maria Toll is in charge of vocal music. The school has an orchestra and mixed chorus, organized by students, graduates and teachers, and conducted by Mr. C. Pringsheim. They give public concerts several times a year. Generally speaking, the Tokyo Academy of Music attaches much importance to German classical music, and the orchestra plays, among other masterpieces, symphonies and overtures by Beethoven, Bach and Mozart, although modern French works, such as the Nocturne by Debussy, have occasionally been attempted. The latest performances were the Fifth Symphony by G. Mahler, 1932, and the Ninth Symphony by Beethoven in the spring of 1933. In addition to this government academy, there are several private music schools, among which the most outstanding is the Tokyo Higher School of Music (Tokyo Koto Ongakuin), at Kunitachi-mura, Tokyo, each with its own orchestra and mixed chorus.

(2) Orchestras. Outside the schools there were also several orchestral groups, but all, except the New Symphony Orchestra conducted by Viscount Hidemaro Konoé, have dissolved for want of support in an age of economic depression. The surviving symphony orchestra holds concerts twice a month regularly, and has already given over a hundred entertainments, rendering pieces by various German composers, like Beethoven, Schumann, Schubert and Brahms, as well as the works of Tschaikovsky, Rimsky-Korsakoff and Moussorgsky. Several modern French productions have also been rendered. Besides, the orchestra takes advantage of the visits of Western musicians to give the orchestral accompaniment to their rendering. The Nippon Symphony Orchestra, conducted by Mr. Kosaku Yamada, has

Digitized by Google

now almost merged into the New Symphony Orchestra, on whose platform its conductor is occasionally seen. A mandolin orchestra, known as the Sinfonia Mandolini Orchestra, was created in the early Taisho era, the conductor of which is Mr. Morishigé Takei of the Bureau of Court Music of the Imperial Household Department; it gives concerts twice a year, in spring and autumn. Among foreign musicians of note who have visited Japan are Mischa Elman, Efrem Zimbalist, Fritz Kreisler, Jascha Heifetz, Jacques Thibaud, John McCormack, Ernestine Schumann-Heink, Amelita Galli-Curci, Toti Dal Monte, Mischa Levistzki, Benno Moiseivitch and Leopold Godowsky. Several Italian and Russian opera companies and Russian orchestras have also performed.

(3) Choruses. Besides those attached to schools there are several amateur chorus companies under the leadership of professional musicians. As there are no good chorus pieces in the Japanese language, no appreciable success has yet been attained. In most ordinary educational institutions, such as universities and colleges, there are music clubs, each with its male chorus.

(4) Opera. In the early Taisho era there was created in the Imperial Theatre an opera company under the leadership of Professor Rossi. Miss Tamaki Miura, who was regarded a prima donna at this nascent stage of Japanese opera, became a member of the company and finally won world-wide notice as an opera singer. The company later dissolved and the members organized an operetta troupe, which, after a brief period of obscure existence, met the same fate. In more recent years, stimulated by the visit of Russian and Italian opera companies a movement to revive opera was started, but no tangible success has been attained. Opera scenes have been sometimes broadcast by the radio broadcasting stations, but no native opera company has yet reappeared. Inasmuch, however, as the Tokyo Academy of Music is directing some of its talent towards this line of music, genuine Japanese opera may be expected to materialize in the near future.

(5) Religious Music. The music of the churches does not show the development that one might expect. This is, perhaps, because the members are not favoured with much musical endowment. However, recently there came into existence, outside the Church, groups which investigate religious music. At the Tokyo Academy of Music choral and cantata pieces have often been rendered by chorus and orchestra, giving Mozart's "Requiem" and the "Missa Solemnis" by Beethoven.

(6) Exhibitions. It is but recently that musical competitions have come to be held. The first trial of the kind was attempted by mandolin orchestras at the close of the Taisho era, while chorus exhibitions were not given until the Showa era. In 1932, under the auspices of the Jiji Shimpo, a contest of piano, violin and vocal music was arranged to be held annually, the judges to award the prizes being leading musicians of the capital. Furthermore, it was so arranged that the three most talented among those taking prizes were to be sent to Europe. A young pianist, Miss Miwako Kai, won the highest honour at the first exhibition.

(7) Composers. In the realm of musical composition Japan still lingers in the stage of research.

Messrs. K. Yamada and Kosuké Komatsu—all leading Japanese composers—have almost entirely ceased to wield influence, but seeing that there are a number of young musicians who are devoted to the study

Early Yedo Era The last period begins and ends in the early Yedo era. All through this period popular music prevailed; the samisen, a popular musical instrument introduced into the country towards the end of the Ashikaga era, rose to great influence. Naturally, therefore, such popular music as the joruri, nagauta, kouta and hauta developed rapidly; they were especially popular among merchants and artisans.

The samisen was not only a representative musical instrument throughout the Yedo era but also occupies a most important position in Japanese music today. This three-stringed Japanese guitar has now come to enjoy worldwide recognition as an advanced musical instrument. Nearly 400 years ago, toward the end of the Muromachi period, it arrived in the country through the Ryukyu islands and is supposed to be of Spanish or Chinese origin. Compared with the sho and biwa, imported in the 5th or 6th century, the samisen is a thing of but yesterday. Yet it is found everywhere in Japan as an accompaniment to vocal music.

The Fourth Period

Internationalization of Japanese Music The fourth period covers the Meiji and Taisho eras (1868-1926) when domestic music rose to join the world current of music. The people awoke from their long slumber throughout the isolated Yedo era, and exchanged anti-foreignism for free intercourse with the outside world. With this epochal open-door movement came the Meiji Restoration which eliminated the Shogunate and restored the old Imperial régime. In obedience to the august wish of the Emperor Meiji all welcomed the introduction of the supposedly more advanced European civilization. Music was no exception. European music then imported was enthusiastically imitated all through the period. Production of imitative art was not the only task assigned to that age, for side by side with the movement the reconstruction of native music occupied the serious attention of musicians. A similar tendency is noticeable in and about the Nara period in the 8th century, when advanced ideas, imported from the continent, afforded models on which the ancient music of the country was reconstructed. Yet, a great difference is evident between that and the movement now under review; because, whereas in that day home music still lingered in the primitive stage and imitation of alien models was effected only with extreme difficulty, improvement in the native music of the Meiji era was so easy a matter that reconstruction could be carried out by mere importation of new staffs. This fourth period, which corresponds to the Meiji and Taisho eras, can be studied from three points of view, with reference to the development of the art.

(1) Innovations in Traditional Music and Revival of Ancient Music. In the Yedo period the development of music in form was insignificant, because importance was placed on expression of sentiment. People who realized this defect in the traditional Japanese music, agreed on the necessity of introducing radical innovations in this direction. This new movement was responsible for the stimulus given by the extensive introduction of European music, which in form was far superior to Japanese. Up to about the 16th year of Meiji considerable effort was expended towards eliminating this defect. As a practical attempt to attain this object, a movement was created for reconstruction work on the form of sho music which had deplorably degenerated in the Yedo

Digitized by Google

era, due to the influence of samisen music then at the height of popularity. The rise of the Yamada school in Tokyo is an example. Shakuhachi music likewise could not escape being influenced by the reconstruction current of the times.

For revival of ancient Japanese music the Gagaku Bureau was created in the Imperial Household Office in the 3rd year of Meiji. A large number of authorities on gagaku became officials of the bureau and strove to effect reorganization of the ancient music of Japanese parentage. These Court musicians set about composing new music out of gagaku, for use in elementary schools. The national anthem, Kimigayo, is a product of that bureau. Precisely speaking, Kimigayo ought to be played in gagaku, but, instead, it has come to be rendered with European instruments; for in those days they were the only musical instruments in educational institutions. Kibigaku, which is still popular in the Kansai district, is a form of gagaku somewhat vulgarized, at the time, by Hoshu Kishimoto, an Okayama musician.

(2) Diffusion of European Music. One of the outstanding features of musical development in the Meiji and Taisho eras is that Japanese musical education was placed on the foundation of European music. The introduction of European music into Japan can be traced as far back as the entrance into Japan of Christianity. This, however, had been monopolized by the introducers themselves in their respective localities of influence, until in the 2nd year of Meiji it entered the capital for the first time. In this year Japanese soldiers learned military band music from an English naval band master at Yokohama, which is perhaps the first instance of our official use of European music. Soon afterwards, in the 5th year of Meiji, both army and navy bands were inaugurated. Later, in the 12th year of Meiji, an investigation commission on school musical education was established in the Education Office. A commission, headed by Mr. Shuji Izawa, conducted inquiries as to the best method of teaching European music in Japanese schools. In the following year the Education Department invited an expert from America, and, under his superintendence, made music a part of elementary school education. Three years after, the Tokyo School of Music was established. This briefly is but an outline of the growth of European music in Japan during the Meiji era. It was mainly due to Government encouragement that European music was popularized in Japan much earlier than generally expected. But, for sounder and more thorough instruction in European music we must look to the era of Taisho. Rapid progress of music in the Taisho era was made possible principally in the following ways:

(a) Propagation by Gramophone. This invention enabled inhabitants of even the remotest corners of the island Empire to appreciate the great foreign music masters.

(b) European War and Visiting Musicians. At the outbreak of the European War many well-known musicians of the West went to America and Oriental countries in order to avoid being involved in the turmoil, and to find appreciation of their music in more peaceful environment. These world-famous musicians gave a number of concerts in Japan, and thus afforded us an opportunity to hear the best music the world can produce. So fortunate an event contributed much toward cultivating a taste for music in this country. Not long afterwards came radio, also from the West; and, like

Digitized by Google

of the wake left by German music, or the harmonies of French music, it is hoped that the basis of a new Japanese music will be laid. As regards the general public, they have grown somewhat tired of German classical music and turned their attention to the lighter airs of southern Europe, of even the jazz now in vogue in the United States. In urban centres social dances prevail to such an extent that folk-songs are set mostly to dance music. In the field of genuine Japanese music, songs akin to kouta are now in vogue, the leading vocalists being Miss Katsutaro and Miss Ichimaru, both of whom are geisha. Not only folk-songs but war songs have revived, since the Manchuria emergency. The old war ditties sung at the time of the Sino-Japanese and Russo-Japanese Wars have come again into vogue, together with a new and thrilling ballad with the "Three Heroic Warriors" who made bombs of themselves at Shanghai, as its theme.

(8) Vocal Soloists. The most noted vocal soloists are Tamaki Miura, Yoshié Fujiwara, Toshiko Sekiya and Yoshiko Miyagawa. But among instrumental musicians there is no name specially worthy of notice; Mrs. Koko Ando, formerly professor at the Tokyo Academy of Music, has won distinction as a violinist under the tuition of Joseph Joachim, but she has seen her best days, and is now settled down as a successful teacher. At the Bureau of Court Music in the Imperial Household Office each musician performs on his own favourite European instrument; and there is an orchestra which at one time was quite influential. In the orchestra there are some good violinists and cellists but few who have been on the stage as soloists. There is, however, a string quartet, organized by some of the members of the orchestra, called the Haydn Quartet. Long established, it is now regarded as the only superior quartet in Japan, though occasional changes occur in its membership. As a violinist, Miss Nejiko Suwa is regarded as having the brightest future. Though only a lass of thirteen, trained under Professor Moguilewsky, she has yet sufficient understanding of classical music to leave no doubt of her exceptional musical talent.

(9) The Piano. The piano is the most popular musical instrument in the Japanese home at present. Even among amateur girl pianists there are many who display fair attainment. In singular contrast to this, few male pianists show skill in the art of music. This can be explained by the fact that formerly Japanese girls used to start their musical education with the koto (Japanese harp), which, having proved too primitive and monotonous, has gradually fallen into decline, being replaced by the piano. In this way the younger daughters of the upper middle class in towns have begun to receive training on the piano. In these circumstances there is naturally a dearth of male musicians outside the domain of vocalists. In this connection too it is interesting to note that Lafcadio Hearn, the famous interpreter of Japan, once remarked that the Japanese had no faculty for music, referring to their apparent lack of appreciation of Western music at that time. His somewhat rash remark has happily proved unjustified. Western music in Japan is still in transition. The Japanese have become good listeners, but have not yet become good players. But there is really no good reason why in the future Japan will not turn out world-famous musicians. For this, training is of course the great essential. Encouraging signs are already evident among our young mu-

Digitized by Google

sicians, especially women. For instance, Miss Chieko Hara, a pianist only 17 years old, won the first prize in the 1932 concours in Paris.

1933-1934 Music In the early part of 1933 there were held a number of recitals, the important ones being a piano solo by Chiyeko Hara in February; a vocal solo by Maria Toll, and a piano solo by Leo Sirota in the same month; and vocal music by Yoshiko Nagasaka, Boku Kageyama, etc. Furthermore Sirota, Moguilewsky, and Pollack made important contributions towards Japanese appreciation of Western masterpieces all through the year, either in the ensemble or through radio. In March a recital in honour of the new graduates of musical schools was held at Hibiya. The second concours under the auspices of the Jiji Shimpo was held at Hibiya on May 13 and 14, and the first prizes were awarded Miss Masako Kanematsu (instrumental music, piano), Miss Kayoko Izaki (vocal music, soprano), and Mr. Setsu Imagawa (composition). The result in general showed a decided advance compared with the first concours.

May 7 of the year was the centenary of Johannes Brahms (1833-1897) and on April 22 the ceremonial concert in his honour was given in the Asahi Hall under the auspices of the Asahi, and the Sirota Trio, Maria Toll, and Nobu Suzuki took part in it. The New Symphony Orchestra also celebrated the occasion in the Hibiya Auditorium accompanied with Leo Sirota's piano solo.

Friedmann of Poland visited Japan in September and his piano recital lasted for five evenings, October 2-6, in the Hibiya Auditorium. He left an enduring impression in the heart of Japanese lovers of music. A critic on music said, "one may talk about the genuine beauty of piano music and the poetic value of Chopin after he has listened to Friedmann play Chopin."

The Tokyo Academy of Music held a special concert in the presence of the Empress on March 17, 1934 in celebration of the birth of the Crown Prince. The programme consisted of the No "Takasago", by Umewaka, Kanzé and Hosho; the nagauta "Tsuru-kamé", by Yoshizumi; the koto music, by Michio Miyagi; Mozart's Coronation Symphony, conducted by Pringsheim; Wagner's Imperial March and Bach's Prelude in E Major, by Sueko Ogura. It was one of the best performances ever given by the Academy.

Leo Sirota gave a piano recital in the Nippon Young Men's Hall at Aoyama on April 23. The pieces chosen were rather for specialists than for the mass, including Busoni's piece, Chopin's Ballade, Dvorák's Humoresque, Smetana's Polka and Stravinsky's third movement of Petrouchka. His simple rendering and easy representation of these difficult pieces carried his audience completely.

Sydny Kreutzer and Nicolai Tcherepnin visited Japan in 1934 and the former gave concerts on the works of Schumann and Chopin while the latter introduced his own compositions.

From October to December, 1934, the New Symphony Orchestra gave excellent representations of Beethoven for nights.

Native Music (1) The Koto. The koto has long been popular in Japan as a domestic musical instrument. It still retains friends among all classes, although it has lost some of its former popularity. Improvements have been attempted by specialists in recent years. An authority on koto music, Michio Miyagi, attempted to organize an orchestra with koto, shakuhachi (Japanese bamboo clarionet) and samisen. Like most koto

Digitized by Google

musicians, he showed more talent than insight, by attempting, on traditional Japanese musical instruments pieces he composed in European style, but has already attained a fair success. The "Spring Sea", a duet for koto and violin was composed by him and rendered by Madame Renée Chemet, a violinist who visited Japan in 1932.

(2) Nagauta. This is samisen music, developed in the Yedo period, and still serves widely as an accompaniment to dances at theatres; and social entertainment, in homes. But it has never been able to rise superior to its early development in the gay quarters; the text remains too vulgar for domestic occasions. Through the efforts of a singer, Kosaburo Yoshidzumi, and a samisen player, Rokushiro Kineya, the nagauta texts are now being revised to suit family taste, new compositions for children being produced and new rhythms introduced. Another pioneer in this field is Sakichi Kineya, himself a noted samisen player. He once attempted the composition of a concerto for the samisen as a solo instrument with a view to cultivating a new sphere for the samisen. The success or failure of the new attempt remains to be seen. Other noted musicians of nagauta are Ijuro Yoshimura, Wafu Matsunaga; and samisenists, Kangyoku Kineya, Eizo Kineya, Isaburo Kashiwa.

(3) Joruri. The joruri music is made up of tokiwazu and kiyomoto, besides gidayu. Kiyomoto is mostly a lyric melody for a tenor voice; while tokiwazu demands a high baritone and is therefore rich in dramatic element. The joruri music is now employed merely as an accompaniment to stage dance and ballets; it scarcely goes beyond preserving the old tradition. It is interesting to note in this respect that Enju-dayu, a descendant of the Kiyomoto family, by which the school was founded, is a splendid lyric tenor whose art overshadows even Japanese vocalists of the Western style. The gidayu music is indispensable to the kabuki (Japanese classical play) and ningyo shibai (puppet-theatre) in their stage performances, but this music contains not only ordinary airs but it also has plenty of musical recitation.

Noted joruri musicians are: kiyomoto—Enju-dayu, Kiku-tayu, Umekichi (samisenist); tokiwazu—Matsuo-dayu, Mojibeë (samisenist); gidayu — Shikoro-dayu Takemoto, Tsu-dayu Takemoto, Tosa-tayu Takemoto, Koutsubo-dayu Toyotaké and Iwao-dayu Toyotaké.

CHAPTER XXXVI

SPORTS

Japan in the World Olympics

Stockholm and Antwerp Japan participated in the World Olympic Games for the first time in 1912, at Stockholm, when only two athletes represented the country. They were Shizo Kanaguri, marathon runner, and Yahiko Mishima, short-distance runner, both of whom were miserably defeated. In the following Olympiad, which was held in Antwerp in 1920, 15 Japanese took part. Of these, 11 were track and field men, and the others were two swimmers and two tennis players. Neither the track and field men nor the swimmers placed. The tennis entrants won second place.

The Paris Olympiad Japan made its real debut in the Eighth Olympic Games in Paris in 1924, with 14 men participating. A third place in wrestling was the only official score, but Mikio Oda won sixth place in the hop, step and jump; the swimming team placed fourth in the 800-metre relay; Katsuo Takaishi came in fourth in both the 100-metre and 1,500-metre free style, and Kenkichi Saito took sixth place in the backstroke event.

At Amsterdam The year 1928 found 63 Japanese competing in the North Olympic Games at Amsterdam. The late Miss Kinué Hitomi was the only girl in the Japanese delegation and the first Japanese woman to take part in the Olympics, made impressive performances. She won a 100-metre heat in 12.8 seconds and took second place in the 800-metre finals by negotiating the distance in 2 minutes 17.7 seconds. Mikio Oda not only scored for the first time but won Japan's first Olympic championship by taking the hop, step and jump event. In the swimming competition, an equally bright success was attained by Yoshiyuki Tsuruta, who took first place and the championship in the 200-metre breaststroke. Kazuo Kimura placed sixth in the running high jump; Yonétaro Nakazawa placed sixth in the pole vault; Kanésaku Yamada placed fourth and Séiichiro Tsuda placed sixth, respectively, in the marathon; Katsuo Takaishi won third place in the 100-metre free style swim; Toshio Iriyé came in fourth in the 100-metre backstroke; the 800-metre relay team placed second. The swimmers won second place in competition with the United States, the championship winner. Japanese took part in the boxing, regatta and equestrian contests for the first time but lost.

At Los Angeles The results achieved at Los Angeles by 131 athletes were satisfactory. The delegation took seven championships, seven second places and four third places.

(1) **Aquatic Meet** Japan dominated the 1932 aquatic meet as no other nation had done in the past. Of 150 official points scored in the six races, 86 went to Japan and only 46 to all other nations together. The result is Japan 86 and America 33, with the rest outdistanced. Only one race was by a non-Japanese champion, the 400-metre free style, in which Clarence Crabbe, of the United States, and Jean Taris, of France, upset expectations and finished ahead of the Japanese trio in

Digitized by Google

new record time. The only team race, the 800-metre relay, went to Japan by a wide margin in almost incredible time, 8 min. 58.4 sec.

The Japanese swimmers produced both world and Olympic records in the Los Angeles meet. The Japanese 800-metre relay team produced a new world record with a time of 8 min. 58.4 sec. Shozo Makino set a new world mark when he swam the first 1,000 metres in the 1,500-metre free style, broke the Olympic record, 58.6 sec., set by the great American swimmer, Johnnie Weismuller, by negotiating the distance in 58 sec. flat. Others who broke Olympic records were Reizo Koiké, who won the 200-metre breast stroke in 2 min. 44.9 sec., and Katsuo Kitamura, 15-year-old boy, who won the 1,500-metre free style in 19 min. 13.4 sec.

(2) **Track and Field Events** In the track and field events, the Japanese did not show up so brilliantly as did their team mates in the aquatic events. Thanks to Chuhéi Nambu, however, Japan was able to defend the hop, step and jump championship which Mikio Oda had won at Amsterdam in 1924. With a mark of 15.72 metres, Nambu not only won the championship but established a new world record. Another outstanding performance was turned by Baron Takéichi Nishi, of the Japanese Army, who won the difficult equestrian contest, the Prix des Nations. By winning this steeplechase, Baron Nishi put Japan's horsemanship on a high plane in the eyes of the world.

The principal performances of the Japanese athletes of both sexes and their records are given below :

TRACK AND FIELD

100-metre run—Ryutoku Yoshioka won sixth place in the finals. Time, 10.8s.

400-metre relay—Japan's team placed fifth.

1,600-metre relay—Japan's team placed fifth.

Marathon—Seiichiro Tsuda placed fifth and Onbai Kin sixth. Time, 2h.35m.42s. and 2h. 37m.28s. respectively.

Running high jump—Kazuo Kimura placed sixth with 1.90 metres and Misao Ono seventh.

Running broad jump—Chuhei Nambu placed third with 7.45 metres, and Naoto Tajima sixth with 7.15 metres.

Pole vault—Shuhei Nishida barely missed the championship by losing to Bill Miller, of the United States, placing second with 2.28 metres.

Hop, step and jump—Chuhei Nambu won and defended successfully the title which Mikio Oda had captured at the Amsterdam meet. Nambu's record, 15.72 metres, set a new world mark.

SWIMMING

100-metre free style—Yasuji Miyazaki won. Time, 58.2 seconds, breaking the Olympic record set by Johnnie Weismuller but Miyazaki had turned in a better record, 58 seconds, in the semi-finals.

400-metre free style—Tsutomu Oyokota placed third with 4 minutes 52.3 seconds.

1,500-metre free style—Kusuo Kitamura won. Time, 19 minutes 12.4 seconds, which broke the Olympic record set by Arne Borg.

100-metre back stroke—Masaji Kiyokawa won. Time, 1 minute 8.6 seconds.

200-metre breast stroke—Yoshiyuki Tsuruta won. Time, 2 minutes 45.4 seconds, which broke the Olympic record

800-metre relay—Japan's team won. Time 8 minutes 58.4 seconds, which set a new world record.

WOMEN'S TRACK AND FIELD

400-metre relay—Japan's team placed fifth. Time, 50.2 seconds, which broke Japan's record.

Javelin—Miss Masako Jimbo placed fourth with 39.06 metres.

WOMEN'S SWIMMING

100-metre back stroke—Miss Misao Yokota placed fifth in the semi-finals.

200-metre breast stroke—Miss Hideko Maehata placed second, only four-fifths of a second behind the winner. Time, 3 minutes 6.4 seconds, which broke the existing Olympic and world records.

400-metre relay—Japan's team (Kojima, Yokota, Morioka and Arata) placed fifth. Time, 5 minutes 6.7 seconds.

HOCKEY

Japan's team placed second.

EQUESTRIAN COMPETITION

Lieutenant Baron Takeichi Nishi won the Prix des Nations.

Digitized by Google

Japan will send a delegation of 337 athletes and officials to the World Olympic Games to be held in Berlin next year, it was decided in May, 1935, by the Olympic Preparatory Committee of the Japan Amateur Athletic Federation. This will be nearly twice the number Japan sent to the last Olympic Games in Los Angeles. The increase will be a part of Japan's campaign to bring the 12th Olympic Games to Tokyo in 1940.

The Japanese contingent will participate in the 14 events, skiing, skating, track and field, swimming, boxing, soccer, basketball, rowing, field hockey, wrestling, gymnastics, riding, yachting and art. Japan will enter the soccer games and yacht races for the first time, while basketball is a new sports adopted by the coming Olympiad. The sum of ¥1,250,000 has been provided for the athletes' expenses.

The Tenth Far Eastern Olympiad

The Tenth Far Eastern Championship Games were held in Manila between May 12 and 21, 1934. Much trouble was created in Japan before the Japan Amateur Athletic Federation finally decided to participate in the event. The Japanese side proposed to the headquarters of the Championship Games that Manchoukuo, represented by the Manchoukuo Amateur Athletic Federation, should be allowed to participate in the event. A protest was raised by both China and the Philippines that the matter had to be submitted to a general conference of the participating countries and the Constitution of the Games be revised for admittance of Manchoukuo. This attitude angered those supporting the Manchoukuo side and caused them to advise the Japan Amateur Athletic Federation to withdraw from the event, unless the matter was accepted. The matter was telegraphed to the Manila headquarters, but the reply was that it had to be submitted to a general meeting for approval. In the midst of a vigorous opposition, the Japanese Federation submitted to its general meeting a plan whether it had to attend the games in Manila or renounce its right to participate, leaving the Manchoukuo Federation, and finally it was decided the Federation would attend it with a determination to discuss matters regarding the Manchoukuo participation in the next event and to withdraw from the Games, if the Constitution could not be revised so as to let the Manchoukuo participation possible. In course of the games in Manila, the matter was discussed, but failed to be adopted by unanimous consent. In consequence, the Japanese Federation made up its mind to depart from the Games and to organize a new athletic federation with the object of promoting physical culture. Japan, however, participated in the Tenth Games throughout. On June 12, after the return of the Japanese sports delegation to Japan, it was resolved by the delegation that the Japanese Amateur Athletic Federation withdraw from the Far Eastern Championship Games and organize the Amateur Athletic Association of the Orient. Japan, Manchoukuo and the Philippines have decided to join the new Federation, but China will not join it. Thus the Far Eastern Championship Games have been forced to break up.

Results of the Tenth Far Eastern Championship Games follow:

Development of Western Sports

The History Young When a Japanese refers to "sports," he usually means Western athletic sports, not the traditional sports of Japan. The tremendous interest of the Japanese in Western sports and the remarkable development that they have made in them have relegated Japan's own sports to the background. One may pay tribute to the athletic prowess of the Japanese and their adaptability and capacity for assimilation, but one strong reason for the great popularity of the sports from the West may be sought in the fact that most Western sports are played collectively, instead of individually as in the case of Japanese fencing and judo, and they appear to suit the race in their modern mode of life. Western sports, moreover, offer the Japanese an opportunity to compete with other athletic nations and demonstrate their ability. This gives more incentive for their enthusiasm for foreign sports.

Despite their remarkable growth, Western sports in Japan are very young, and their history is a matter of only half a century. Sixty years ago, no Western sport worth the name existed in Japan. The fact that Japan could send only two athletes to the World Olympic Games for the first time as late as 20 years ago and suffered a miserable defeat is indicative of the slight athletic progress the country had attained up to that time. Except for baseball, which was played zealously even in the earlier years, it is no exaggeration to say that Japan's participation in the World Olympics provided the real incentive for the growth of Western sports in general.

The Far Eastern Olympiad It should be added in this connection that, one year after Japan's first participation in the World Olympics, the Far Eastern Olympic Games were organized, with Japan, China and the Philippines as the participants. There is little doubt that this minor Olympics had a great deal to do with athletic development in Japan. As in the case of the World Olympics, Japan had an insignificant beginning as far as points go, but in 1930 the country so completely defeated the Philippines and China that one who was acquainted with the remarkable athletic progress in Japan doubted the usefulness of further competition in the Far Eastern Olympic Games. The first meet of this junior Olympics was held at Manila in 1913, and since then successive Far Eastern Olympic Games have been held every other year. In 1930, when the last meet was held in Tokyo, it was agreed to hold the meet every four years so that it would not clash with the World Olympics. The last Far Eastern Olympic Games took place in Manila in May, 1934. In addition to the World and Far Eastern Olympic Games, there have been from time to time frequent exchanges of visits between Japanese athletic teams and those of foreign countries, which not only has offered the Japanese opportunities to learn valuable lessons but has proved a medium through which international friendship can be formed.

Traditional Sports Of Japan's traditional sports, those which have remained from ancient times and which still hold the interest of the people include jujitsu (judo), known as the art of self-defence; kenjutsu (kendo), or fencing; sumo, or wrestling, and swimming (native styles). All these major sports are still being practised throughout the country. Probably the most popular is wrestling. At the Kokugikan amphitheatre at Ryogoku, on the bank of the Sumida River, which flows

Digitized by Google

through Tokyo, a professional wrestling tournament is held twice a year, in January and May. H.I.M. the Emperor invites almost each year not only professional wrestlers but jujitsu and fencing masters of the land to the palace for matches in His Majesty's presence. In addition to these Japanese sports, there are others, such as archery and horsemanship of ancient origin, but they have suffered more or less decadence since the overthrow of feudalism.

Under Education Minister All sports in Japan are controlled either by the Ministry of Education or the Home Office. All students' sports are under the jurisdiction of the Education Ministry, and such non-student affairs as Japanese professional wrestling and professional boxing are under the control of the Home Office. Matters such as the maintenance of peace and order in and around the wrestling amphitheatre or boxing ring are in the hands of the local police.

The leading athletic organization in Japan is the Amateur Athletic Association, with Ryozo Hiranuma as acting president. This is the organization which controls track and field games in Japan and selects athletes for international meets. There are other similar organizations, such as the Japan Amateur Swimming Federation and the Japan Lawn Tennis Association.

Records Various statistics of records made by Japanese athletes follow:

JAPAN'S AND WORLD'S TRACK AND FIELD RECORDS

Baseball

Baseball is the most popular and most widely played game in Japan. Sumo, the Japanese style of wrestling, had been known for many years as the national game, but baseball came from the United States and caught popular fancy. The American pastime is now recognized as the de facto national game of this country. The Japanese are agile by nature and gifted with quick headwork and therefore are fitted to play baseball, although their weakness in batting is admit-

Digitized by Google

ted. American professional players who have been to Japan and played with the Japanese have said that the Japanese are good pitchers and good fielders, but poor hitters and have recommended that efforts be made to improve batting.

No Professionals Despite the great popularity of the game, there is no professional baseball in Japan. All the games that excite public interest are those of university teams. From time to time there has been talk of organizing professional baseball with players recruited from among graduating university ball players, but so far the talk has not materialized. Opinion is divided as to the advisability of such a scheme. One section of opinion holds that unless professional baseball is organized the game will never attain the degree of perfection in technique which characterizes American professional baseball, for college players' careers as ball players end with graduation, minimizing further chance for improvement of ability; the other emphasizes the spiritual side of the game and opposes the move on the ground that professional baseball would degenerate the fair and clean game now played in Japan.

Its Inception Like track and field sports, baseball was brought to Japan in the early years of Meiji. It is recorded that baseball was introduced by two American teachers in 1872. Not much progress was made until after 1890. The First High School is known as the first school which organized a strong team. Keio University and Waseda University also organized teams. Games began to be played between those schools with much zeal. In 1905, Waseda University sent its team to the United States. It played 27 games and won seven, but the team brought to Japan new tricks, such as winding and bunting, which had been unknown here until that time. Organized cheering was begun about the same time. From then on, American university teams, such as those of St. Louis, Wisconsin, Washington and Chicago Universities, came to Japan. At first, the American invaders were sure to win. As years went by, baseball in Japan developed greatly, however, and now it is admitted that Japanese university teams are on a par with American varsity nines. Hence the almost semi-annual exchange of university baseball teams between Japan and the United States.

Its Development The development of baseball in Japan owes much to the visits of American professional players. In 1913, Japan invited the leading players of the New York Giants and the Chicago White Sox to play with the Japanese and coach them. In 1931, a picked American professional team came under the management of Mr. Herb Hunter. Those Big League players not only impressed the Japanese with spectacular playing but also opened their eyes to the possibilities of further improvement in technique. In 1932, Mr. Hunter brought here Frank (Lefty) O'Doul and a few other Big League players for the purpose of coaching Japanese university players.

The University League The game was laid on a firm foundation in 1925 when the present Six-University Baseball League of Tokyo was organized among Waseda, Keio, Meiji, Hosei, Rikkyo and Imperial Universities. Of the semi-annual league series, the most popular is the Waseda-Keio series, the interest in which is high, as in the Cambridge-Oxford regatta, because of the historical background. Before the present league was formed, Waseda and Keio had such keen rivalry that bloodshed was caused at one of the games and the series had to be abandoned for

Digitized by Google

20 years. The creation of the league revived the series, and they are now the World Series of Japan. Each Waseda-Keio game is usually attended by a capacity crowd of 60,000 at the Meiji Jingu (Shrine) grounds, Tokyo.

In the semi-annual league seasons, each university plays a two-game series with the others. The championship winners are decided on the basis of the number of series won, not the number of games won. In case two teams win an equal number of series, the one which comes out with the better percentage is declared the winner; but in case the two teams happen to have the same percentage record, a game is played to decide the title.

The following tables show the complete results of the games in both seasons of 1934, according to the new arrangement made in 1933:

	Hosei	Waseda	Meiji	Rikkyo	Keio	Imp.	Won	Draw	Percentage
Hosei	x	2	2	1	3	3	11	1	.786
Waseda	1	x	2	2	2	3	10	0	.667
Meiji	1	1	x	3	2	3	10	0	.667
Rikkyo	1	1	0	x	1	2	5	1	.357
Keio	0	1	1	2	x	1	5	0	.333
Imperial	0	0	0	1	2	x	3	0	.200
Lost	3	5	5	9	10	12			

Hosei won the pennant.

The two-season system was revived in 1935 and its spring season resulted as follows:

	Hosei	Waseda	Meiji	Rikkyo	Keio	Imperial	Won	Percentage
Hosei	x	2	2	2	2	2	10	.909
Waseda	1	x	2	2	2	2	9	.818
Meiji	0	0	x	2	2	2	6	.600
Rikkyo	0	0	0	x	2	2	4	.400
Keio	0	0	0	0	x	1	1	.100
Imperial	0	0	0	0	1	x	1	.100
Lost	1	2	4	6	9	9		

Hosei defended its title, by beating Waseda, 6 to 5, in the deciding game.

Thirteen baseball players of Harvard University, star nine of the Eastern Collegiate League of the United States, arrived in Tokyo on August 16, 1934, for a series of games against the members of the Tokyo University League and Tokyo Club. The collegians, under the leadership of Coach Henry Chauncey, came at the invitation of Keio University.

The Harvard nine played eight games in Tokyo and two in Osaka, and won only four games and lost six others.

The following was the line-up of the Harvard team:

Edward F. Loughlin (captain), pitcher; Chadwick Braggiotti, pitcher.
Paul deGive, pitcher and catcher; Richard Maguire, catcher.
Charles Nevin, first base; John Adzigian, second base.
Craig Woodruff, third base; Thomas Bilodeau, shortstop.
John Fitzpatrick, Frank Owen, Braman Gibbs.
Gardner Prouty and John Ware, outfielders.

Digitized by Google

The results of the games:

Harvard 4-2 Tokyo Imperial; Tokyo Club 8-6 Harvard; Hosei 12-3 Harvard; Rikkyo 9-3 Harvard; Meiji 10-8 Harvard; Harvard 9-7 Keio; Waseda 17-2 Harvard; Keio 6-5 Harvard; Harvard 8-2 Kwansai; and Harvard 13-7 Keio.

Marking as one of the biggest events in the history of the Japanese baseball, 15 star baseball players of the American major leagues, made a barnstorming tour to Japan in the fall of 1934 at the invitation of the Yomiuri Shimbun. They arrived in Yokohama on November 2 and stayed for a month during which they made a clean sweep of winning 18 games against the All Japan nine in leading cities of this country. Mr. Connie Mack, the veteran baseball coach and manager of the Philadelphia Athletics Club, was the leader of the team.

The American team, including such famous players as Babe Ruth, home-run King, Lou Gehrig, Jimmy Foxx and Charles Gehringer, were given a tremendous welcome by the Japanese baseball fans in every city they visited. Every baseball grounds where they played, were filled more than its capacity with the enthusiastic fans, who were, in return, treated with amazing and excellent play by the visitors, both in batting and fielding. Especially Babe Ruth was centre of the attraction, his play being observed keenly by the Japanese. He also was chased around heavily by a large number of autograph hunters wherever he appeared, just same as in his home country.

The All Japan team which was specially formed to meet the American stars with the former star players in the Japanese college leagues, the strongest nine Japan could offer then, was beaten by a lopsided score by the visitors in almost every game they played. A total of 47 home runs was recorded by the American players during their sojourn, with Ruth leading with 13. A name of "home run team," was given by the Japanese fans for their heavy and amazing batting works by Ruth, Gehrig, Foxx, Averill and Gehringer, who all hit home run more than four each.

The American team was consisted of the following players:

Eric McNair (Philadelphia Athletics), shortstop.
Charled I. Gehringer (Tigers), second base.
Babe Ruth (Yankees), left field and first base.
Lou Gehrig (Yankees), first base.
James Foxx (Athletics), third base.
Earl Averill (Cleveland), centre field.
E. J. Miller (Athletics), right field.
Morris Berg (Cleveland), catcher.
Frank Hayes (Athletics), catcher.
Vernon Gomez (Yankees), pitcher.
Earl Whitehill (Washington), pitcher.
Clinton H. Brown (Cleveland), pitcher.
Edward Cascarella (Athletics), pitcher.
Hal Warstler (Athletics), substitute for infielder.
Frank O'Doul (Giants), outfielder.
Mr. John A. Quinn, the noted Southern League umpire, acted as chief umpire.

Results of the games follow:

Americans 17-1 Tokyo Club (Meiji Shrine Grounds, Tokyo, November 4)
Americans 5-1 All Japan (Meiji Shrine Grounds, Tokyo, November 5)
Americans 5-2 All Japan (Yunokawa Grounds, Hakodaté, November 8)
Americans 7-0 All Japan (Yagiyama Grounds Sendai, November 9)
Americans 10-0 All Japan (Meiji Shrine Grounds, Tokyo, November 10)
Ruth team 13-2 Miller team, exhibition (Meiji Shrine Grounds, Tokyo, November 11)
Americans 14-0 All Japan (Jintsu Grounds, Toyama, November 13)
Americans 15-6 All Japan (Meiji Shrine Grounds, Tokyo, November 17)
Americans 21-4 All Japan (Yokohama Park Grounds, Yokohama, November 18)
Americans 1-0 All Japan (Shizuoka City Grounds, Shizuoka, November 20)
Americans 6-5 All Japan (Narumi Grounds, Nagoya, November 22)
Americans 6-2 All Japan (Narumi Grounds, Nagoya, November 23)
Americans 15-3 All Japan (Koshien Grounds, Hyogo, November 24)
Miller team 5-1 Ruth team, exhibition (Koshien Grounds, Hyogo, November 25)

Americans 8-1 All Japan (Itatsu Grounds, Kokura, November 26)
Americans 14-1 All Japan (Kyoto City Grounds, Kyoto, November 28)
Americans 23-5 All Japan (Omiya Grounds, Saitama, November 29)
Americans 14-5 All Japan (Utsunomiya Grounds, Tochigi, December 1)

Track and Field

The birth of track and field sports in Japan dates back to the Meiji Restoration in 1868. In the following year, a physical training course was added to the curriculum of middle schools, which consisted of gymnastics introduced by the Dutch. In the meantime, those who returned home to Japan from abroad, much impressed by athletics in foreign countries advocated the introduction of Western athletics. Several foreign teachers were invited to teach athletics as well as English. Running and jumping were taught, but progress was slow. The first Japanese track and field meet was held in Tokyo in 1884, but the first really systematic athletic meet was not held until 1886. At the latter meet, programmes were printed. It was an epoch-making event. Track and field events about 1889 and 1890 were almost the same as they are now. There were the 100, 220, 400, 880 yards, the 100 yard hurdles, cricket ball throw, the three-legged race and so on. As for records, the best was 10.8 seconds for the 100-yard dash and 18 seconds for the 100-yard hurdles. From that time on, progress was gradual until 1912, when Japan took part in the World Olympic Games for the first time. An outline of the progress of Western sports in Japan in subsequent years is given in the first section titled "Japan in the World Olympics."

At the invitation of the Japan Amateur Athletic Federation, the American track and field stars, captained by Glenn Cunningham, the world famous distance runner, visited Japan in September, 1934, for a series of contests against the leading Japanese athletes. They were the first and strongest athletic force ever came to Japan from the United States, and staged one of the biggest track and field events in this country.

The Americans with 14 members, engaged in two dual meets with the selected Japanese team in Tokyo and Osaka, and appeared in five exhibition contests, visiting Nagoya, Dairen, Seoul and Fukuoka. Their visit was successful, contributing much to Japan's athletic circle and also toward the international friendship between the two countries. The Americans won the first dual contest, held on September 8 and 9 in Tokyo, by a score of 84 points to 75, but lost the second meet to Japan by a close 77½ points to 75½ in Osaka a week later, which was an unexpected victory for the local side. Three world and 13 Japanese records were shattered in these dual contests.

Ralph Metcalfe, the ranking dusky American sprinter, covered the 200-metre course in 20.2 seconds, clipping four tenth of a second from his own world mark, both in Tokyo and later in the Dairen meet. Another world record was bettered by a Japanese, Kenkichi Oshima, former Kwansai University ace, who won the hop, step and jump event with a leap of 15.82 metres in the second dual meet in Osaka. The former world record for this event was 15.72 metres held by Chuhei Nambu of Japan, a sensation in the last Olympic Games in Los Angeles.

Members of the American team were :

Glenn Cunningham (Kansas University); John Anderson (Cornell University); Robert Clark (Olympic Club); Frank Crowley (Manhattan College); Gorden Dunn (Stanford University); Donald Favor (University of Maine); Phil Good (Bordoin University); Howard

Digitized by Google

Greene (Abilen Christian College); Charles Hornbostel (Indiana University); Walter Marty (Fresno State University); Ralph Metcalfe (Marquette University); Charles Parsons (University of Southern California); Wirt Thompson (Yale University); and Dudley Wilkins (Louisiana State University). Coach—Mr. John Magee, vice-president of the American Athletic Union.

Winners of the first dual meet were :

Track Events

100-metre dash, Ralph Metcalfe (United States), 10.5 seconds; 200-metre dash, Metcalfe (United States), 20.2 seconds (new werld record); 400-metre run, Charles Hornbostel (United States), 49.2 seconds; 800-metre run, Hornbostel (United States), 1:54.0 minute; 1,500-metre run, Glenn Cunningham (United States), 4:8.6 minutes; 5,000-metre run, Ryu Choshun (Japan), 15:41.8 minutes; 110-metre high hurdles, Phil Good (United States), 14.6 seconds; 400-metre relay, American team (Clark, Greene, Parsons and Metcalfe), 41.3 seconds; and Swedish relay, American team (Metcalfe, Parsons, Greene and Hornbostel), 1:57.6 minute.

Field Events

High jump, Yoshiro Asakuma (Japan), 1.95 metre; broad jump, Naondo Harada (Japan), hop, step and jump, Kenkichi Oshima (Japan), 15.28 metres; pole vault, Suyeo Oyé (Japan), 4 metres; Shot put, Gorden Dunn (United States), 15.26 metres; discus throw, Dunn (United States), 47.42 metres; hammer throw, Isao Abé (Japan), 48.98 metres; and javelin throw, Saburo Nagao (Japan), 62.07 metres.

Points scored :

United States		Japan
6	800-metre run	4
4	Broad jump	6
7	Discus throw	3
7	100-metre dash	3
3	High jump	7
4	5,000-metre run	6
3	Javelin throw	7
4	400-metre relay	1
7	400-metre run	3
6	Shot put	4
4	Pole vault	6
6	High hurdles	3
4	Hammer throw	6
7	200-metre dash	3
3	Hop, step and jump	7
5	1,500-metre run	5
4	Swedish relay	1
84		75

Winners in the second dual meet were :

Track Events

100-metre dash, Ralph Metcalfe (United States), 10.3 seconds (tied the world record); 200-metre dash, Metcalfe (United States), 21.4 seconds; 400-metre run, Charles Hornbostel (United States), 49.2 seconds; 800-metre run, Glenn Cunningham (United States), 3:58.4 minutes; 5,000-metre run, Frank Crowley (United States), 16:8.6 minutes; 110-metre high hurdles, Tadashi Murakami (Japan), 14.6 seconds; and Swedish relay, Japanese team (Yoshioka, Taniguchi, Miyanagi, and Imai), 1:57.5 minute.

Field Events

High jump, Yoshiro Asakuma (Japan), 2 metres; broad jump, Masao Harada (Japan), 7.59 metres; hop, step and jump, Kenkichi Oshima (Japan), 15.82 metres (new world record); pole vault, Suyeo Oyé (Japan), 4.20 metres; shot put, Gorden Dunn (United States), 15.62 metres; discus throw, Dunn (United States), 46.43 metres; hammer throw, Donald Favor (United States), 51.16 metres; and javelin throw, Saburó Nagao (Japan), 62.98 metres.

Points scored :

United States		Japan
7	100-metre dash	3
6	200-metre dash	4
7	400-metre run	3
7	800-metre run	3
5	1,500-metre run	5
5	5,000-metre run	5
4	High hurdles	6
1	Swedish relay	4
3	High jump	6
4	Broad jump	6
2	Hop, step and jump	7
3½	Pole vault	6
6	Shot put	4
7	Discus throw	3
5	Hammer throw	5
3	Javelin throw	7
75½		77½

Tennis

Lawn tennis is the Western sport through which the Japanese nation won international recognition for the first time. The game was introduced into this country more than half a century ago, but real tennis, by which is meant the game as played in the West, began only 20 years or so ago.

Digitized by Google

Until then the Japanese played the game with the "soft ball." Even now the Japanese have two sorts of tennis, the hard ball and soft ball. Japan distinguished herself in tennis for the first time in 1915, when Ichiya Kumagai and Seiichiro Kashio represented her in the Far Eastern Games held in Shanghai. Kashio dropped one singles match, but the rest were won by Japan.

Prominence at Antwerp Japanese tennis players figured prominently in the international athletic world in 1920, when the Japanese entrants in the World Olympic Games at Antwerp won second place. In the following year, the country entered the Davis Cup tournament for the first time and surprised the world by reaching the challenge round, in which, however, the Japanese dropped to the Americans and missed the honours. But this served to win for the country a high place in international tennis. Since then, the Japanese entrants have cut a good figure each year.

The Davis Cup Tournament The following tables show how each year the Japanese players advanced in the Davis Cup tournament in their attempt to win the tennis supremacy of the world:

1921 (Challenge Round)
U.S.A. 5, Japan 0

In the singles matches, Johnston beat Kumagai 6-2, 6-4, 6-2; Tilden beat Shimizu 5-7 4-6, 7-5, 6-2, 6-1; Tilden beat Kumagai 9-7 6-4, 6-1; Johnston beat Shimizu 6-3, 5-7, 6-2, 6-4. In the doubles, Williams and Washburn beat Kumagai and Shimizu 6-2, 7-5, 4-6, 7-5.

1923 (Finals, American Zone)
Australia 4, Japan 1

In the singles matches, Anderson beat Shimizu 6-0, 6-3, 6-3; Hawks beat Fukuda 6-3, 6-4, 6-3; Shimizu beat Hawks 6-4, 3-6, 2-6, 6-1, 6-4; Anderson beat Fukuda 6-1, 3-6, 6-2, 6-1. In the doubles, Anderson and Hawks beat Shimizu and Kashio 6-1, 6-2, 6-2.

1924 (Finals, American Zone)
Australia 5, Japan 0

In the singles matches Patterson beat Shimizu 7-5, 11-9, 6-4; Wood beat Okamoto 6-4, 2-6, 6-4, 2-6, 6-1; Patterson beat Okamoto 7-5, 6-1, 6-4; Wood beat Shimizu 6-4, 6-4, 6-2. In the doubles, Patterson and Wood beat Okamoto and Harada 7-5, 6-2, 6-4.

1925 (Finals, American Zone)
Australia 4, Japan 1

In the singles matches, Patterson beat Shimizu 6-1, 6-4, 6-2; Anderson beat Harada 6-4, 3-6, 6-3, 6-1; Harada beat Patterson 6-2, 3-6, 6-1, 7-5; Hawks beat Fukuda 6-1, 6-3, 6-0. In the doubles, Patterson and Hawks beat Shimizu and Harada 6-1, 6-2, 9-7.

1926 (Finals, European Zone)
France 3, Japan 2

In the singles matches, Cochet beat Tawara 1-6, 4-6, 7-5, 6-3, 6-2; Harada beat Lacoste 6-4, 4-6, 6-3, 9-7; Lacoste beat Tawara 6-1, 6-3, 6-2; Harada beat Cochet 6-1, 6-3, 0-6, 6-4. In the doubles, Cochet and Brugnon beat Harada and Tawara 6-0, 6-0, 6-2.

1927 (Finals, European Zone)
France 5, Japan 0

In the singles, Cochet beat Ohta 6-0, 6-3, 6-2; Lacoste beat Harada 6-1, 6-1, 6-2; Harada and Ohta scratched the other two matches. In the doubles, Cochet and Brugnon beat Toba and Harada 9-7, 6-1, 6-2.

1928 (Finals, American Zone)
U.S.A. 5, Japan 0

In the singles, Tilden beat Abé 6-2, 6-3, 6-0; Hennessey beat Ohta 8-6, 6-3, 6-3; Cohen beat Abé 7-9, 6-2, 6-4, 7-5; Tilden beat Ohta 6-8, 6-3, 6-1, 6-0. In the doubles, Tilden and Lott beat Toba and Abé 6-1, 10-8, 6-2.

1929 (Second Round, American Zone)
U.S.A. 4, Japan 1

In the singles matches, Hennessey beat Abé 8-6, 6-1, 3-6, 6-1; Ohta beat Van Ryn 6-4, 5-7, 2-6, 6-4, 7-5; Van Ryn beat Abé 6-2, 4-6, 6-3, 6-2; Hennessey beat Ohta 6-2, 6-2, 6-2. In the doubles, Hennessey and Van Ryn beat Abé and Ohta 6-3, 6-4, 6-2.

1930 (Finals, European Zone)
Italy 3, Japan 2

In the singles matches, de Stefani beat Ohta 6-3, 6-4, 4-6, 6-4; Harada beat Morpurgo

Digitized by Google

6-4, 6-3, 7-5; Harada beat de Stefani 6-2, 7-5, 7-5; Morpurgo beat Ohta 6-0, 6-0, 6-1. In the doubles, Morpurgo and Gaslini beat Harada and Abé 8-6, 9-7, 6-3, 2-6, 6-1.

1931 (Second Round, European Zone)
Great Britain 5, Japan 0

In the singles matches, Perry beat Jiro Sato 6-1, 4-6, 7-5, 7-5; Austin beat Hyotaro Sato 0-6, 6-2, 6-4, 6-1; Austin beat Kawaji 6-1, 0-6, 8-6, 6-2; Perry beat Hyotaro Sato 6-2, 6-3, 4-6, 6-2. In the doubles, Hughes and Perry beat Jiro Sato and Kawaji 6-4, 6-4, 8-6.

1932 (Semi-finals, European Zone)
Italy 3, Japan 2

Kuwabara beat Palmieri 6-0, 6-2, 1-6, 6-3; de Stefani beat Jiro Sato 6-3, 6-4, 6-4; Palmieri beat Jiro Sato 4-6, 4-6, 6-1, 6-2; de Stefani beat Kuwabara 6-2, 6-2, 6-4. In the doubles, Jiro Sato and Miki beat Palmieri and Sertario 6-4, 6-4, 6-3.

1933 (Semi-finals, European Zone)
Australia 3, Japan 2

Jack Crawford beat Ryosuké Nunoi 6-2, 4-6, 6-3, 4-6, 7-5; Vivian MacGrath beat Jiro Sato 9-7, 1-6, 4-6, 6-4, 7-5; Jiro Sato beat Crawford 3-6, 6-3, 6-1, 1-6, 6-2; Nunoi beat MacGrath 6-4, 6-4, 6-3, 7-5. In the doubles Adrian Quist and Crawford beat Sato and Nunoi 7-5, 7-9, 6-3, 3-6 and 6-3.

1934 (Second round of European Zone)
Australia, 4 Japan 1

Jack Crawford beat Jiro Fujikura, 6-3, 6-3, 11-9. Vivian McGrath beat Jiro Yamagishi, 2-6, 7-5, 6-2, 6-4. Fujikura beat McGrath, 6-4, 5-7, 6-2, 8-6. Oswald Turnbull beat Yamagishi, 6-4, 7-5, 9-7.

In the doubles, Crawford and Adrian Quist beat Yamagishi and Hideo Nishimura, 6-1, 6-0, 4-6, 9-7.

1935 (Second round of European Zone)
Czechoslovakia 4, Japan 1

In the singles matches, Roderick Menzel beat Hideo Nishimura, 6-3, 6-2, 8-6; Josef Zaska beat Jiro Yamagishi, 6-1, 8-6, 6-3; Zaska beat Nishimura, 6-2, 6-3, 6-8, 6-2; and Yamagishi beat Ladislau Hecht, 6-4, 6-1, 6-3.

In the doubles, Menzel and Josef Malacek beat Nishimura and Yamagishi, 2-6, 6-2, 6-1, 6-1. All matches were played at Prague on June 6, 7 and 8.

Tennis Ranking in Japan

Rankings are decided by a committee of the Japan Lawn Tennis Association on the basis of the results of matches played in Japan. It happens, therefore, that Davis Cup players, who have had no chance to play in Japan, are barred from the ranking list. A new list is announced usually each January.

The ranking list for 1934 and 1935 follows :

Singles

	1934	1935
1.	Hideo Nishimura (Keio U.)	Jiro Yamagishi (Keio U.)
2.	Jiro Yamagishi (Keio U.)	Hideo Nishimura (Keio U.)
3.	Jiro Fujikura (Meiji U.)	Shunsuké Hirai (Keio U.)
4.	Hyotaro Sato (Asahi Shimbun)	Chuji Kusumoto (Tokyo Imperial U.)
5.	Hajimé Ebisu (Kajimaya Club)	Shigeo Akimoto (Koshien Club)
6.	Yoshio Miyagi (Tokyo Imperial U.)	Hyotaro Sato (Asahi Shimbun)
7.	Shogoro Yamaoka (Waseda U.)	Keigo Yamada (Keio U.)
8.	Keigo Yamada (Keio U.)	Junzo Kinoshita (Kwansei Gakuin)
9.	Shunsuké Hirai (Keio U.)	Shinroku Hayashi (Tokyo Imperial U.)
10.	Yasuo Murakami (Keio U.)	Masataro Tsukada (Meiji U.)
11.	Chuji Kusumoto (Tokyo Imperial U.)	Sakuzo Hasegawa (Senshu U.)
12.	Akimasa Miura (Waseda U.)	Asao Takada (Tokyo Commercial U.)
13.	Toshiji Yoshioka (Kyoto Club)	Jiro Fujikura (Meiji U.)
14.	Masatomo Tsukada (Meiji U.)	Akimasa Miura (Waseda U.)
15.	Junzo Kinoshita (Kwansei Gakuin)	Tatsuro Goto (Tokyo Commercial U.)
16.	Tatsuro Goto (Tokyo Commercial U.)	Ainosuké Kuwazawa (Waseda U.)
17.	Shizuo Fujii (Kwansai U.)	Reizo Murakami (Keio U.)
18.	Masayoshi Takahashi (Keio U.)	Masayoshi Takahashi (Keio U.)
19.	Ainosuké Kuwazawa (Waseda U.)	Shizuo Fujii (Kwansai U.)
20.	Tsunaji Watanabé (Waseda U.)	Nobuo Ozaki (Kwansei Gakuin)

Digitized by Google

		Doubles
1.	Nishimura-Yamagishi (Keio U.)	Nishimura-Yamagishi (Keio U.)
2.	Fujikura brothers (Meiji U.)	Takahashi-Murakami (Keio U.)
3.	Yamaoka-Yoshikawa (Waseda U.)	Fujii-Kuramitsu (Kwansai U.)
4.	Miyagi-Saito (Tokyo Imperial U.)	Kuwasawa-Hattori (Waseda U.)
5.	Yasuda-Watanabé (Waseda U.)	Kinoshita-Ozaki (Kwansei Gakuin)
6.	Uyehara-Murakami (Koshien Club)	Fujikura-Tsukada (Meiji U.)
7.	Kuwabara-Uyehara (Osawa Shokai)	Goto-Takada (Tokyo Commercial U.)
8.	R. Murakami-Takahashi (Keio U.)	Akimoto-Horigoshi (Koshien Club)
9.	Kajima-Kusumoto (Tokyo Imperial U.)	Kawamura-Kiyosu (Kwansei Gakuin)
10.	Kawasaki-Kinoshita (Kansei Gakuin)	Hasegawa-Isobé (Senshu U.)

The following list shows the winners in the annual National Tennis Championship tournament which takes place in Tokyo in November every year:

	Singles	Doubles
1922	Masanosuké Fukuda	Tamio Abé and Ryuzo Kawazuma
1923	Takeichi Harada	Tamio Abé and Ryuzo Kawazuma
1924	Tsumio Tawara	Iwao Aoki and Taku Ukegawa
1925	Tsumio Tawara	Tamio Abé and Kyo Kawajiri
1926	Yoshio Ota	Hisataka Aizawa and Kengo Asoo
1927	Tamio Abé	Tamio Abé and Masanosuké Fukuda
1928	Hajimé Makino	Seiichi Yamagishi and Hikoshichi Shimura
1929	Takeichi Harada	Ichiya Kumagai and Takeichi Harada
1930	Jiro Sato	Seiichi Yamagishi and Hikoshichi Shimura
1931	Takao Kuwabara	Seiichi Yamagishi and Yasuo Murakami
1932	Ryosuké Nunoi	Jiro Sato and Minoru Kawaji
1933	Hideo Nishimura	Hideo Nishimura and Jiro Yamagishi
1934	Jiro Yamagishi	Hideo Nishimura and Jiro Yamagishi

In the 1934 tournament, Yamagishi won the singles title by defeating Hideo Nishimura in the final by a score of 6-0, 6-3, 6-1. The doubles championship was successfully defended by Yamagishi and Nishimura who beat Reizo Murakami and Masayoshi Takahashi of Keio University in an easy three-set match, the score being 6-0, 6-2, 6-2.

Swimming

Swimming is one of Japan's major sports that has been handed down from time immemorial. Surrounded on all sides by the sea, the people of the Island Empire had easy access to water. It was but natural that the people became adept in swimming, and swimming masters turned out several distinct styles of swimming, some of which more or less resembled the Western crawl of the present day. Swimming in ancient Japan was a serious subject of study, especially for the fishermen and warriors, to whom swimming was more a practical necessity than a healthful diversion.

The Western crawl was introduced into Japan about 1910. Since then the Japanese have not only copied but developed it into a more perfect stroke. The result was the remarkable showing made by the Japanese mermen at the Tenth Olympiad in Los Angeles in 1932.

As a partial explanation of the swimming ability of the Japanese, it is said that the race is particularly fitted for prowess in swimming. A modern physician once said that the Japanese show better development than other peoples in the muscles in the upper part of the lower limbs that bind them with the lower part

Digitized by Google

of the trunk. It is noted in this connection that clever use of the lower limbs, which depend on the muscles in the upper limbs, plays an important part in swimming.

The 1934 national swimming championship meet, held on August 11, 12 and 13 at the Meiji Shrine pool, Tokyo, was featured by the participation of the three American crack mermen, Jack Medica, Arthur Highland and Albert Vande Weghe, who won three out of six events they took part. Two world records were broken in the meet, one by Vande Weghe, and the other by Negami.

The full results follow :

Men's Events

100-metre free style—Won by Masanori Yusa (Nihon); 2nd, Highland (United States); 3rd, Sakagami (Waseda). Time, 59 seconds.

200-metre free style—Won by Masanori Yusa (Nihon); 2nd, Taguchi (Kyoto); 3rd, Sugiura (Mitsuké). Time, 2:17.4 minutes.

400-metre free style—Won by Jack Medica (United States); 2nd, Makino (Waseda); 3rd, Negami (Rikkyo). Time, 4:47.8 minutes.

1,500-metre free style—Won by Hiroshi Negami (Rikkyo); 2nd, Makino (Waseda); 3rd, Medica (United States). Time, 19:16.6 minutes. Negami's lap time in the 1,000-metre, 12:41.8 minutes was a new world record.

100-metre back stroke—Won by Albert Vande Weghe (United States); 2nd, Yoshida (Saeki); 3rd, Katsuhisa (Waseda). Time, 1:8.8 minute.

200-metre back stroke—Won by Albert Vande Weghe (United States); 2nd, Yoshida (Saeki Middle); 3rd, Kawazu (Meiji). Time, 2:33.2 minutes (new world record).

100-metre breast stroke—Won by Reizo Koiké (Keio); 2nd, Hamuro (Nihon); 3rd, Okada (Nihon). Time, 1:15.0 minute.

200-metre breast stroke—Won by Reizo Koiké (Keio); 2nd, Hamuro (Nihon); 3rd, Nakagawa (Nagoya). Time, 2:45.0 minutes.

800-metre relay—Won by Waseda team (Nagami, Shimura, Sakagami and Makino); 2nd, Meiji; 3rd, Kyoto Butokukai. Time, 9:15.0 minutes.

Women's Events

100-metre free style—Won by Umeko Shiomi (Sugiyama); 2nd, Kojima (Sugiyama); 3rd, Watanabé (Aichi Shukutoku) Time, 1:16.4 minute.

200-metre free style—Won by Kazuyé Kojima (Sugiyama); 2nd, Shiomi (Sugiyama); 3rd, Kokan (Chukyo). Time, 2:51.0 minutes.

400—metre free style—Won by Tsuneko Furuta (Nakaizui); 2nd, Kawamura (Yokohama); 3rd, Kitajima (Sugiyama). Time, 6:36.6 minutes.

100-metre back stroke—Won by Haruko Kogiso (Aichi Shukutoku); 2nd, Oda (Tsukushi); 3rd, Izumi (Kyoto). Time, 1:30.0 minute.

200-metre breast stroke—Won by Hideko Mayehata (Sugiyama); 2nd, Tsuboi (Kyoto); 3rd, Mashita (Kyoto Nijo). Time, 3:5.8 minutes.

400-metre relay—Won by Sugiyama team (Shiomi, Mayehata, Hattori and Kojima); 2nd, Kyoto Nijo; 3rd, Aichi Shukutoku. Time, 5:22.4 minutes.

Wrestling (Sumo)

Japan's traditional wrestling, known in Japanese as sumo, is another ancient sport of Japan. It is recorded in ancient history that Nomi-no Sukuné and Taéma-no Kehaya wrestled before the Emperor Suinin. In feudal times each lord had under him the strongest wrestler of the province, and he made it a custom to arrange a match with the wrestler of another lord. Such being the case, the wrestler who was strong and won for his lord many laurels enjoyed warm patronage. Public estimation of wrestlers in those days was unusually high. During the Tokugawa era, which extended for nearly 300 years before the Meiji Restoration (1868), a wrestling tournament was organized, and in January and May of each year the best wrestlers of the Kwanto district (Eastern Japan) gathered for it at Ryogoku, Yédo (present Tokyo). Rankings were decided on the basis of the showing made at the tournaments, and the wrestlers exhibited great enthusiasm in their matches. This custom remains even to this day.

Until late in the Meiji era (1868-1912), Japan had two major wrestling organizations, one in Tokyo and the other in Osaka, but later they merged into one organization. At

Digitized by Google

the end of 1931, however, the Japan Wrestling Association had internal trouble. To be more precise, many wrestlers became dissatisfied with the traditional system of distribution of profits because the retired wrestlers, who acted as officials of the association, took the major part, virtually disregarding the wrestlers on the active list. The trouble divided the wrestlers into three separate groups. In addition to the one which remains in the association, there are the Shinko and Kakushin groups. The latter two groups adopted new rules for wrestling, and the group which remains in the association is the only one which retains the traditional wrestling.

The semi-annual tournaments of the Japan Wrestling Association are held at the Kokugi-kan amphitheatre at Ryogoku, Tokyo, in January and May. Each tournament lasts for 11 days. The wrestlers are all professional, and the majority of them have unusually well-developed bodies. Victory in a typical Japanese wrestling match is a matter of a minute or two. Very often it is a matter of a few seconds. The wrestler who forces his opponent to fall or even let any part of the body above the knee touch the ground or to jump out of the ring is declared by the umpire to be the winner. It is said that there are 48 different ways of defeating an opponent. Wrestling is also practised widely in schools, as are jujitsu and fencing.

The list of the principal sumo wrestlers, in May, 1935, follows :

In the order of seniority in the East Camp, Tamanishiki (Yokozuua, or Grand Champion); Musashiyama (Ozeki, or Champion); Shinkai (Sekiwaké, or champion No. 2); Hatasegawa (Komusubi, or champion No. 3).

In the order of seniority in the West Camp, Minanogawa (Ozeki, or Champion); Shimizugawa (Haridashi-Ozeki, or junior champion); Takanobori (Sekiwaké, or champion No. 2); Tomoyegata (Komusubi, or champion No. 3)

Jujitsu (Judo)

Jujitsu, more popularly known as judo, is more a military art than a sport. In olden times, this art of self-defence was widely practised among the warriors, to whom it came next to kenjutsu, or fencing, in importance. One essential difference between wrestling and jujitsu is in the use of strength. The wrestler as a rule throws down his opponent by his own strength, but the jujitsu expert uses little of his own strength, rather taking advantage of the weight and strength of his opponent in hurling him to the floor. Action is unusually swift, and a good expert of jujitsu can easily dispose of a dozen non-jujitsu men in a fight.

This manly art of self-defence was developed to its present popularity and prosperity chiefly by Prof. Jigoro Kano, promoter of the Kodokan style of jujitsu and head of the Kodokan, the leading jujitsu training quarters in Japan. Since he established the Kodokan in 1886, he has turned out thousands of experts, and these experts in turn have popularized the art throughout the length and breadth of the land. After the Russo-Japanese War, jujitsu became popular in foreign countries, where Japanese instructors were invited to teach it. Some foreign writers became enthusiastic over the art, which they said embodied the spirit of the Japanese race, and even went the length of declaring that to it the Japanese owed in large measure their brilliant victory in the Russo-Japanese War, the first war in which an Oriental nation defeated a major Western Power.

At present jujitsu is practised in all middle schools and other higher schools in Japan for its value in physical and mental culture. Many schools have teams, and as with baseball and tennis these teams have seasonal clashes. Private clubs and

Digitized by Google

training halls are found in all cities of Japan. Experts receive degrees from the Kodokan.

The list of Japan's outstanding jujitsu experts of the Kodokan includes Nagaoka and Isogai, both holders of kudan, the strongest, Iizuka, Samura, Tabata and Mifuné, all holders of hachidan, the next strongest.

Boxing

Boxing is a Western sport which has earned phenomenal popularity in Japan during the past few years. Earlier, interest was quite negligible. The rapidity with which boxing has become popular in this country owes much to American motion pictures, which introduced it. The hero who gives the villain a black eye and finally knocks him down caught the fancy of the Japanese people, and films recording the major bouts of the past decade, including the famous Dempsey-Tunney fight, also went a long way toward creating interest in boxing here.

Boxing clubs are to be found in all leading cities of Japan. In Tokyo there are about 20 professional clubs which from time to time arrange bouts for the public. There are, of course, champions, both professional and amateur. Foreign boxers are invited to fight Japanese pugilists. Intercollegiate boxing bouts are as popular as professional bouts and draw a heavy attendance, often several thousand men and women. It is only during the past few years, however, that boxing has paid its way.

Records show that boxing was first introduced to Japan by foreign sailors in the early years of the Meiji era (1868-1912) at Yokohama, where they landed and held a few bouts among themselves. It is also recorded that a foreign sailor had a dispute with a Japanese samurai on the street and knocked him down in the clash which followed. The first boxing club in Japan was organized in 1910 by Mr. Kenji Kano. In about 1920, American motion pictures introduced to Japan many scenes in which boxing was employed. In the meantime, Mr. Yujiro Watanabé, trained by the noted negro fighter, Turner, returned to Japan and established a club of his own to train many youths in the pugilistic game.

Japanese boxers participated in the World Olympic Games for the first time in 1928 at Amsterdam. Of the two entrants, one lost the first tussle, but Kintaro Usuda, a welterweight, won two bouts before losing in the quarter-finals. In the Tenth Olympiad, held at Los Angeles, the Japanese boxers made an insignificant showing, not one winning a single bout. In 1931, the All-Japan Professional Boxing Association was organized to control professional boxing.

The first national boxing championship tournament was held for eight days, beginning November 5, 1934, under the joint auspices of the Japan Professional Boxing Federation and the Tokyo Nichi-Nichi Shimbun. The bouts on first five days (November 5, 12, 19, 30 and December 9) were held at the Hibiya Public Hall in Tokyo, mostly elimination matches, and the remaining three cards (December 16, 24 and 25) were held at the wrestling bowl of the Kokugikan, Ryogoku.

More than 150 boxers, mostly from Tokyo, Nagoya, Kobé, Osaka and Seoul, took part. The championships were contested in five different divisions—flyweight, bantamweight, lightweight and welterweight. The participants were divided into two classes, A and B. 30 leading fighters who appeared as favourites for

Digitized by Google

championship honours were seeded in A class, and all others were included in B class. The New York Commission rules were applied to the tournament.

Results of the final round, a 10-round match each, were as follows:

Flyweight, Yoichiro Hanada (Imperial Club), 110 pounds, defeated Isamu Ito (Imperial Club), 104 pounds, on point.

Bantamweight, Shoichi Otsu (Kyokuto Club), 113 pounds, defeated Takeshi Makino (Toho Club), 117 pounds, on point.

Featherweight, Tsuneo ("Piston") Horiguchi (Nihon Club), 126 pounds, defeated Sanekatsu Koiké (Dai-Nihon Club), 126 pounds, on point.

Lightweight, Kotaro Suzuki (Imperial Club), 122 pounds, defeated Koichi Takada (Nitto Club), 131 pounds, on point.

Welterweight, Yoshio Natori (Tokyo Club), 133 pounds, won over Riichi Sato (Toho Club), 143 pounds, by a foul in the seventh round.

Football

Rugby Imported from England, this winter sport has gained much popularity during the past decade. The leading universities in Tokyo have a league, and their matches draw large crowds. Japan and Canada have exchanged teams during the last few years. The all-Japan team which invaded Canada left a very impressive record, winning several matches and losing none.

Soccer Soccer is also fast gaining popularity here. The Football Association was organized in September, 1921, in Tokyo, and since then an annual national championship game has been held.

Results of the Kwanto Inter-Varsity Rugby League, 1934.

	Meiji	Waseda	Keio	Hosei	Imperial	Shodai	Rikkyo	Won
Meiji	x	1	1	1	1	1	1	6
Waseda	0	x	1	1	1	1	1	5
Keio	0	0	x	1	1	1	1	4
Hosei	0	0	0	x	1	1	1	3
Imperial	0	0	0	0	x	1	1	2
Shodai	0	0	0	0	0	x	1	1
Rikkyo	0	0	0	0	0	0	x	0
Lost	0	1	2	3	4	5	6	

The Meiji fifteen captured the championship by winning all matches.

The deciding match for the national collegiate title between Meiji, the Kwanto champion, and the Kyoto Imperial, winner of the Kwansai league, ended in a victory of the latter by a score of 16 points to 13. The winners scored two goals, one try and one penalty goal, while Meiji made two goals and one penalty goal. The match was played at the Hanazono stadium in Kyoto on January 7, 1935.

After winning the Kwanto league matches, the Meiji University team invaded Shanghai in December, 1934, and won all three matches they played there. The following is the results:

December 16, Meiji defeated the American Marine team, 42 to 6.
December 22, Meiji defeated the Shanghai Club 19 to 11.
December 25, Meiji defeated the All Shanghai team, 11 to 8.

The Tokyo Collegiate Soccer League, formed in 1923, now boasts of 33 members which are divided into six divisions. Keio and Waseda were tied in the first place of the first division matches in 1934. The two teams met in the deciding game for the Tokyo title twice, but fought to draw each time. The first game resulted in a 3-3 tie and the second, 7-7. The championship, therefore, is kept by the League.

Digitized by Google

Waseda, representing the Tokyo League, shut out the Kyoto Imperial eleven, winner of the Kwansai League, by 6 goals to 0 to win the national Collegiate championship. The match was played at the Koshien stadium, near Osaka, December 16, 1934.

Rowing

This is one of the Western sports introduced to Japan early in the Meiji era. The Tokyo Imperial University took it up first. Japan's rowing team did not fare well at the Tenth Olympic Games at Los Angeles. Lack of training and poor physical power were blamed for the defeat. The leading universities have races on the Sumida River each year.

The final tryout to select the crew that will represent Japan in the Olympic Games at Berlin in 1936, was held on the River Ara on June 1, 2 and 3, with twelve of the leading college crews of the country taking part. The crews competed were the Tokyo Imperial University, the Tokyo University of Commerce, Keio, Waseda, Meiji, Nihon, Takudai, Japan Medical, the Tokyo School of Foreign Languages, Okura Higher Commercial, the Kyoto Imperial and Doshisha.

Several upsets featured the tryout through excellent performances by new comers such as Nihon and Takudai, resulting Waseda, the 1932 Olympic crew, being eliminated on the first-day race. Keio, the 1934 national and inter-college champion, was also defeated on the second day by Nihon. The Tokyo Imperial University eight, however, finally won a victory, by defeating Nihon by two lengths in the deciding race on the third day. The winner's time for the 2,000-metre course was 6 minutes flat and that of Nihon 6 minutes 7 seconds. The experts and officials of the Japan Rowing Association predict that the Imperial crew will be placed in the next Olympic races after a year of training, as it finished the race with the excellent time.

Members of the Imperial crew are :

Position	Names	Age	Height	Weight
Cox	Tadashi Kirishima	23	5.1 feet	96 pounds
Stroke	Tadashi Negishi	23	5.6	129
7	Katsu Kashiwabara	21	5.6	137
6	Mondo Sekigawa	22	5.9	160
5	Isamu Mita	22	5.9	140
4	Osamu Kitamura	23	5.6	143
3	Haruyoshi Nakagawa	23	5.7	143
2	Takeo Hori	22	5.6	132
Bow	Yoshiteru Suzuki	24	5.5	130
	Average Height		5.6 feet	
	Average Weight		134 pounds	
	Coach		Mr. Shuhei Seta.	

Horsemanship

Japan's horsemanship won international recognition at the Tenth Olympiad at Los Angeles when Lieutenant Baron Takeichi Nishi, of the Japanese Army, won the Prix des Nations and had the flag of the Rising Sun hoisted. Horsemanship was widely practised by the warriors of the feudal period as a military art. The Japanese army attaches importance to horsemanship and takes great pains in training officers and men. Horsemanship is also gaining popularity among college students and even women. There are at present about 15 clubs in large cities,

Digitized by Google

and many universities and colleges have their own riding societies. Horse racing regained popularity with the use of pari-mutual tickets under strict restrictions in 1923. The Government encourages racing by granting aids. There are more than a score of race clubs throughout the country, most of the races being held semi-annually, that is in the spring and autumn.

Those qualified in the second tryout, selecting five members of the Japan's riding team to the Olympic Games in 1936, held at the Military Cavalry School, Chiba, in May, 1935, were :

Major Seishiro Otaki ; Captains Hosaku Imamura, Asanosuké Matsui and Baron Takeichi Nishi ; Lieutenants Manabu Iwabashi and Hiroji Inaba. Except Captain Baron Nishi who won the Prix des Nations at the 10th Olympic Games in Los Angeles, all other five are new comers. The final tryout is scheduled to take place in December, 1935.

Takeshigé Yoshida (Hosei University) won the 1934 championship of the national student horsemanship tournament.

Golf

Once a pastime of the wealthy, golf is beginning to become popular with the opening of public courses. Clubs are to be found in practically all large cities and their environs. A group of Japanese golfers visited the United States in 1932 and participated in national and State tournaments. Although they failed to win any title, they made impressive records. The list of golf links follow :

Skiing and Skating

Introduced here only a decade or so ago, skiing has become extremely popular. Japan abounds in good grounds in the northern districts, which accounts for the rapid strides skiing has made. Numerous women are taking to it of recent years. In 1929, Hannes Schneider, the prominent Austrian skiier, visited Japan and exhibited his technique at various skiing slopes at Akakura, Myoko, etc., making a great impression among Japan's ski lovers.

Skating is an older game than skiing in this country. As a sport for the general public, an exhibition was first given about 1907 on Lake Suwa, in Nagano prefecture. The All-Japan Skating Championship Meet for speed skating, figure skating and ice hockey is held there yearly. At Nikko, a rink of tremendous size was laid in the winter

Other Sports

Basketball Basketball is very popular not only among boys but girls in secondary and higher schools. The Meiji University basketball team invaded the United States in the winter of 1932 and 1933, but it made an insignificant showing.

At the joint invitation of the Japan Basketball Association and the Hochi Shimbun, an American all-star basketball squad of eight men headed by Mr. Clarence Anderson, assistant basketball coach of the University of Southern California, arrived in Yokohama May 5, 1935. The Americans stayed in this country for a month during which they played eight games and one exhibition match with the leading Japanese teams, winning all. Their visit benefited the basketball circle of Japan a great deal, mastering the American's excellent tactics in both defence and charge.

Results of the games were :

Americans 33-25 Tokyo Imperial University team (Tokyo); Americans 38-23 Japan's pick-up student team (Tokyo); Americans 34-14 All Japan (Tokyo); Americans 36-23 All Japan (Osaka); Americans 64-32 Kyoto Imperial University team (Kyoto); Americans 22-15 All Japan (Tokyo); Americans 52-24 All Japan (Tokyo); and Americans 74-29 All Niigata (Niigata).

Members of the American team were :

William Pierce (U. S. C.), Richard Linthicum (University of California), Donald Piper (U. C.), George Brotlemarkle (U. C.), Kenneth Fagans (Oregon State College), George Curtner (University of Pittsburgh), Duane Swanson (University of Iowa) and Victor Larkin (U. C.)

Volley-ball This sport came to Japan with basketball and is now quite popular among school girls. National championship games are held annually.

Digitized by Google

Hockey Hockey is more or less a novelty in Japan. It was in November, 1920, that the first national tournament was held, when the Waseda University team captured the honours. At the Tenth Olympiad at Los Angeles, the Japanese team beat the United States squad and finished second behind the Indians.

American Football The American football game was introduced by the picked Japanese student team (formed mostly with the American-born Japanese boys, studying in Tokyo) and the Y. C. and A. C. eleven (foreigners' athletic club in Yokohama) on the Thanksgiving Day, November 29, 1934, at the Meiji Shrine stadium. The game ended in a victory of the Japanese students who shut out the foreigners 26 to 0.

In December, the Tokyo Collegiate American Football League was formed among Meiji, Waseda and Rikkyo, and the league games were played in the same month, with Meiji capturing the first championship by two wins over Rikkyo and Waseda. Waseda finished second, winning over Rikkyo and losing to Meiji, and Rikkyo took third place, losing all games. Hosei and Keio joined the League later.

In March, 1935, the Asahi Shimbun invited 35 leading football players from the United States, selected from several universities in the Pacific Coast, who gave a series of exhibition games in Tokyo, Osaka, Nagoya and Fukuoka. The American football players were led by Mr. Albert L. Maloney star quarter-back of the University of Southern California eleven.

CHAPTER XXXVII

AMUSEMENTS AND CALENDAR OF ANNUAL EVENTS

Amusements

The Drama

Japan has a drama all her own. The common stage is the "kabuki", essentially a product of past ages, which, with its enchanting beauty and gorgeous colour, often captivates the fancy of foreign visitors. The kabuki drama is not old as age goes in Japan. It sprang spontaneously from the people, the tradesmen, the artisans and others who were excluded from the pleasures enjoyed by the aristocrats and samurai in the old days, but, like all organic growth, its forbears may be recognized in the stage art of Japan prior to its birth.

The Origin The religious dance that was the precursor of drama goes back through centuries to the mythological age of the gods, when the great Sun Goddess, offended by her brother, retired to a deep cavern, casting the world into darkness. After trying in vain to entice her from her retreat, the other gods finally hit upon the scheme of flashing a metal mirror into the cave and of jumping and shrieking before its mouth, whereupon the curious Sun Goddess came forth, the mouth of the cave was sealed, light was restored to the world and the dance was added to civilization.

For centuries the dance remained, as in other countries, a religious rite performed in Shinto shrines by virgins. With the incoming of Chinese culture, Chinese music was taken over bodily and introduced into the Imperial Court. At the time of the establishment of the first Shogunate, that at Kamakura in the 13th century, the Buddhist semi-dances and semi-drama made a great appeal to the warrior class, and from them was evolved the "no" drama, in which both actor and playwright are subservient to interpretation. The No is a combination of music, posturing and dialogue, severely bound by conventions, with but little action, appealing to the ear and intellect rather than to the eye. The No found warm patronage among the warriors and feudal lords, continuing to hold its own with them until the Meiji Restoration, when it was identified with the then unpopular Shogunate and suffered a decline which has only recently been mitigated.

But the common people had no part in either the religious or the No dances, not even appearing as spectators. These were the exclusive prerogative of the upper classes.

Popular Stage Appears It was during the early part of the long Tokugawa Shogunate that the democratic stage of Japan came to birth, flowered and bore fruit. An era of peace was ushered in, and the Empire began to prosper in a material way. Not only the kabuki, but the ukiyoyé, or woodblock colour print, and other genre arts date from this period. The people had leisure, money and the inclination for pleasure. It was but natural that forms for providing that pleasure should follow.

The germs of the popular drama

Digitized by Google

may be found in society prior to this period, but have not attained much development. About 370 years before, one of the Shinto shrine dancers, O-Kuni, performed on a public street in the capital city of Kyoto, after which she wandered from place to place for the entertainment of the people. Others followed her lead, until the government decreed that thereafter only men might give public entertainments, due to the moral laxity which had ensued. The name kabuki was first applied to this pioneer dancer. Although the Chinese ideographs forming the word mean literally "singing and dancing art," Japanese scholars say that its true derivation is from an obsolete Japanese verb meaning "to be playful."

The Kabuki The early kabuki actors were social outcasts, or kawara-mono (river bed folks), but as the aristocracy learned of the new art and its charms they secretly slipped away from their palaces and homes to enjoy it. Gradually, as in other nations, the moral and social level of the stage was raised, until today there is no more social prejudice against the actor in Japan than in America and Europe. The late Emperor Meiji's attendance of a troupe of kabuki actors at the home of the late Marquis K. Inouyé improved their status immeasurably.

The introduction of the three-stringed samisen, or guitar, into Japan from the Loochoo Islands constitutes another high-water mark for the drama, for in time the musical compositions for the No were adapted to this instrument of the streets, and there followed the puppet show, which has survived to this day. These marionette theatres called to their aid some of the best talent in the country, musicians, playwrights and puppet manipulators collaborating in the work. From dolls to human beings was a natural step, and the kabuki emerged as a separate and distinct art of a high order.

Drawing extensively on both the No drama and the marionette performances, the kabuki is found to embrace four general classifications: historical dramas, plays of everyday life, fantastic, imaginative improvisations and music-posture plays, or dances. It is often difficult, however, to separate any particular drama into one of the four classifications, for the play with historical characters may also be a play dealing with their very human emotions.

The Technique To the Westerner, the technique of kabuki may seem at first extremely complicated. The drama is primarily a picture for the eye, although dialogue is carried on and an orchestra-chorus seated on the stage plays very much the same rôle as was played by the chorus in classical Greek drama, aiding the action with explanations to the audience. The life and thought, costumes and manners of all classes of feudal society are well illustrated on the kabuki stage, while skilful colour combinations in costumes, stage architecture and furniture tend to carry the spectators into a land of imagination and romance. According to Western visitors, the stage of Japan cannot be surpassed in sheer artistry. In dramatic ability it takes rank with that of any country. In stage settings and mechanics it has much to teach the rest of the world, and it still has something to learn therefrom. Its gorgeousness of costuming and pageantry finds no equal. One of the features of the Japanese theatre is the hana michi, or flowery way, which usually consists of two long narrow platforms on the same level which stretch through the audience from

Digitized by Google

the stage to the rear of the auditorium. They are chosen by the actors for their best entrances and exits and are extremely effective when processions are used.

The Kabuki Actors The profession of kabuki actors is in most cases hereditary. Boys of actors succeed their fathers in the profession, and actors without sons usually adopt the sons of other actors or their best disciples and give them the stage names of their families. Kikugoro Onoyé, one of the most accomplished actors, is the sixth Kikugoro Onoyé, while the late Danjuro Ichikawa represented the ninth generation of the Ichikawa family. Kabuki actors are trained from childhood and because of the difficult conventions to which they must conform few men can become actors after the age of 20.

In kabuki proper, all rôles are taken by men. The onnagata, or woman impersonators, devote years of study to femininity, and in most cases they are more feminine than women. In private life many of them act and speak like women, although married to women.

In comparison with screen actors, kabuki actors are paid much better. Though the matter of salaries is kept highly secret, it is well known that a high-class kabuki actor is given more than ¥10,000 a month, but in cinema circles very few actors obtain as much as ¥1,000. Stage actors are also held in much higher esteem by the general public than screen actors. They still live and work according to the family system. A high-class actor has a troupe, all the members of which are his disciples. Only the head of the troupe receives wages directly from the theatre, and he in turn divides the money among his disciples. Other feudal customs also survive among them.

Tokyo is the dramatic centre in the country. Practically all first-class kabuki actors live here, though there are a few in Osaka. They travel all over the country from time to time. The more noted ones in Tokyo are Utayemon Nakamura, Uzayemon Ichimura, Kikugorō Onoyé, Sadanji Ichikawa, Koshirō Matsumoto, Kichiyemon Nakamura, Chusha Ichikawa, Sojuro Sawamura and Ennosuké Ichikawa. The noted Osaka actors include Enjaku Jitsukawa, Fukusuké Nakamura and Kaisha Nakamura.

On the business side, kabuki is controlled entirely by a single commercial organization, the Shochiku Theatrical Company. This company not only has all the first-class actors under contract but owns or leases all of the principal playhouses throughout the country. The largest and most famous theatre is the Kabuki Theatre, commonly known as the Kabuki-za, situated back of the Ginza, Tokyo. Other well-known theatres in the capital are the Tokyo Theatre, Meiji-za, Shin Kabuki-za and Shimbashi Embujo. The Imperial Theatre, which once earned fame as a modern playhouse, has been converted into a cinema house. Osaka has the Naka-za and Naniwa-za, where Kabuki programmes are given practically throughout the year. The theatres change programmes once a month, and very seldom, if ever, are long runs given, no matter how popular a particular programme may prove, although the pieces which prove popular are repeated from time to time as long as they hold public interest.

The Typical Programme A typical kabuki programme has three to five offerings of different types and lasts six hours, beginning at 4 o'clock in the afternoon and ending at 10 o'clock. The majority of the spectators take dinner in res-

Digitized by Google

taurants in the theatre during intervals. Tickets cost from 50 sen to as much as ¥7 or ¥8 a seat. All the playhouses are of Western-style, at least inside, with chairs provided for seating. Seats may be reserved 10 days in advance.

It is wrong to assume that Japanese actors specialize in producing classics alone. From time to time they insert modern plays between those of bygone generations on the programmes. In the past they have even staged plays from Shakespeare with marked success. Some actors specialize in modern plays, such as Masao Inouyé, Takeo Kawai, Rokuro Kitamura and Sesshu Hayakawa (the last named is also a screen actor known both in Japan and abroad), and they appear with actresses, as the latter are essential for the realistic type of plays, plays which are true to life and without the incongruity and exaggeration which characterize the kabuki.

A little theatre movement in Japan was started about 10 years ago, led by the late Kaoru Osanai, prominent dramatist and stage director. The group which performed at the Tsukiji Little Theatre, Tokyo, produced hundreds of Western plays in Japanese translation, but their performances aroused the interest of only a limited section of the intellectuals. The unexpected death of Mr. Osanai and the business depression that followed dealt a crushing blow to the movement and the actors split into smaller groups of insignificance.

The Revue The revue, a product of the West, is quite in vogue at present in Japan. Imported only a few years ago, it appealed to modern-minded youth, and several revue organizations sprang up. The largest troupe is that of the Shochiku Theatrical Company, with several hundred girls. Another influential organization is the Takarazuka Girls' Opera Troupe, with headquarters at Takarazuka, a hot-spring resort between Osaka and Kobé. It enjoys the distinction of being the oldest in Japan, having been organized nearly two decades ago. The performances of the latter group include operas and revues and are generally more refined than those of the Shochiku Troupe, and they find warm patronage among young girls in the homes of the better and wealthier classes. Costumes and scenery in the revues are both Japanese and foreign. The Shochiku group gives occasional performances in Tokyo and Osaka, and the Takarazuka organization set up a new Tokyo Takarazuka Theatre in 1933 at Hibiya.

The Odori Entirely opposed to this type of foreign-style performances is the "odori", or Japanese dance, as given by the geisha, the native dancing girls. Kyoto, the ancient capital, boasts the best organization, which gives the "miyako odori" each April, better known to foreigners as the cherry dance of Kyoto. In Tokyo, the "azuma odori" (dance of eastern capital) is given at cherry-blossom time by the geisha of the Shimbashi district of the city, who also perform in the autumn, always in their own theatre, the Shimbashi Embujo, which is of Western style. Geisha dances can be enjoyed at private parties at any time of the year.

No Drama

The No drama is as aristocratic as the kabuki drama is plebeian, and even now its performance and enjoyment are practically restricted to the upper classes. There are very few theatres or private houses, if any, where strangers are allowed to view No upon payment of admission. Most No enthusiasts form clubs, and only members and their friends see the productions. Foreigners desiring to attend a No per-

Digitized by Google

formance are admitted through the introduction of the Japan Tourist Bureau or some acquaintance. In feudal Japan, the No was the principal form of entertainment among the aristocrats and the warrior class. It was often given in the presence of the Emperor, and there prevailed a custom for a time of inviting the common people to performances given in commemoration of some happy event by the Tokugawa Shoguns, who used the No on all ceremonial occasions.

The Origin and Stage The origin of the No dates back to the early part of the 15th century. Two men, Kiyotsugu Kan-nami and his son, Motokiyo Séami, revolutionized the "saru-gaku", an ancient form of dance, consisting of juggling feats and comic remarks with actions to suit, with the result that the No in its present form was developed. Not only did these two men build on what was best in their own sarugaku, but they drew freely from the "den-gaku", ancient music, which had much in common with the sarugaku. What was graceful in them was ennobled to profundity in the No, while their comical elements developed into the "kyogen", comic performances, usually given on the same programme with No pieces.

Unlike any other form of drama, the No is performed on a wooden stage of the regular size, built above the ground, 18 feet square, open on three sides, with a narrow extension on one side for the singers and another on the back of the stage for the musicians and attendants. To that rear extension is attached aslant a passage called a bridge. The players appear from under the curtain at the one end of which the passage slightly slopes down. The stage, too, is very slightly tilted to the front.

The No pieces, numbering more than 250, are repeated over and over again, but the interest of the spectators apparently never wanes. The pieces are classified into five groups for convenience: (1) "wakino", which generally deal with Shinto or Buddhist deities; (2) "shuramono", which commonly deal with ghosts of warriors; (3) "kazuramono", with noble ladies acting the main parts; (4) "genzaimono", or present-day pieces, dealing with various manifestations of human nature; (5) pieces dealing with demons or goblins as subjects, or those of congratulatory nature with gay and joyous elements.

For each programme of the No, which generally lasts a good part of a day, one from each of the above-mentioned five classes is given in the order mentioned, with a kyogen between each and generally a dance in an ordinary dress in addition. The whole programme is preceded by a piece called "okina", which is held in special reverence, the person acting its chief character is okina.

The Construction The construction of the No piece is by no means uniform, but very often it is as follows: A waki, the secondary rôle, generally a monk or a Minister of State, first appears and tells who he is. Then he walks a while, singing, suggesting that he is travelling. Coming to a standstill, he announces his arrival at a certain famous spot and takes his place by the post at the front righthand corner facing the stage. Then the mayé jité (shité), the principal character in the first appearance, comes in the form of a farmer, fisherman or priest, etc., describing the scenery of the place and of heroes connected with it, or relates the origin of the temple or shrine as the case may require, thus furnishing the audience with a necessary background to the play. The mayé jité then retires in a hurry. He was in reality no other than a Shinto or Bud-

Digitized by Google

dhist deity, or a ghost of a warrior, in disguise. While waki is startled by the sudden disappearance, there come to the stage common farmers or wood-choppers and give in plain language, spoken more or less in the ordinary way, all detailed information concerning the place, generally reiterating what was already given in intonation, and retire. This allows a necessary time for the principal character to change for reappearance. While waiting, the waki sings, indicating a lapse of time. When it comes to an end, the nochi jité, the principal character in the latter appearance, in proper form and attire as a Shinto or Buddhist deity, or a spirit of a hero, comes to the stage and dances as if in a night stroll, revealing some spiritual attributes. In words and in action he recounts his bravery, his death struggle, or his suffering in the underworld, asking for the prayer of the waki for the peaceful repose of his soul. The shité tells his story as he performs, or he merely dances without any intonation. Generally there is a chorus who intonate either alone or with the performers. In the No drama, action is symbolic, stately and ennobling.

Generally several persons sitting on the side extension sing either in chorus, by themselves, or together with the performer. The musicians on the rear extension consist ordinarily of a player each on the transverse flute, the tsuzumi, which is a small drum struck with the tips of the fingers over the shoulder, the ohkawa, a slightly larger drum struck on the knee also with the tips of the fingers, and the drum beaten with two sticks.

The accessories used on the stage in connection with the play are very simple. A fan is much in evidence in the dance, the studied use of which is very effective with the manipulation of big sleeves. Costumes used in the No are marvels of textile fabrics, refined taste being revealed in bold yet harmonious designs and colours. Above all, the mask to be worn by the principal character and the assistant is a very important part of the No performance. There have been great masters among carvers of No masks in the feudal Japan whose works still remain in a large number.

Six Schools Ever since the great reformation at the beginning of the 15th century, the No has had four main acknowledged schools or houses: Kwanzé, Komparu, Hosho and Kongo, all of which are still thriving. Later, another school, Kita, won official recognition, while still another, Umewaka, also has many followers, the variation upheld by each school being but slight. On the whole, the No performance may well be compared to a masterful Oriental picture in black monochrome, both being guided by highly idealistic aims and with artistic aspirations with many points in common possessing alike great impelling qualities that thrill the devotee and sometimes weary the uninitiated.

The Doll Theatre and Joruri

Japan's doll theatre, the precursor of the kabuki drama, has suffered so much decadence that now the Bunraku-za in Osaka is the only doll troupe of its kind in the country. The plays are kabuki in miniature. Each doll, slightly smaller than life-size, is held by a manipulator on the stage and made to act. The manipulators, who appear in ceremonial robes, put life and spirit into the wooden figures, and they have world fame for their dexterity.

The "joruri (Gidayu)", a dramatic recitation, is not only inseparable from the doll show, but enhances its effect. The joruri reciter usually sits

Digitized by Google

on a raised platform at the right corner of the stage and there sings and recites to the accompaniment of the samisen, whose player sits beside him. Not seldom several reciters and samisen players perform in unison. The dolls, of course, have no voice, and the reciters speak their lines. Both manipulators and singers are trained from childhood. The joruri recital often accompanies the kabuki performance. The joruri or Gidayu is also recited for its own sake entirely independently of the doll show or the kabuki.

Yosé, or Story-Telling

Professional story-telling is a distinct Japanese art, which, defying the onrush of the movies, still survives in Tokyo and elsewhere. When there were no movies, story-telling was one of the few common forms of amusement. The houses where the story-tellers perform are called yosé, a sort of variety hall, where singing, juggling, dancing and other entertainment are offered in addition to the story-telling.

Today a score of story-tellers' halls can still be found in Tokyo. Unlike theatres for the drama and the cinema, they are usually Japanese-style frame houses, with unattractive advertisements covering their fronts. Inside, a yosé forms a large matted room, with a small matted stage attached. All the guests sit on cushions spread on the matting, and the performers sit on the matting of the stage. Usually the house has a balcony with more expensive seats.

The majority of the story-tellers, who are called hanashika, specialize in comic talk. Those who specialize in stories of heroism and adventure, are called koshakushi, or romance readers, and regarded as of a different class. The hanashika use a lot of punning, irony and sarcasm, and each story has a twist at the end. Translated into English, their talk loses almost all meaning, for it is the manner that is important.

A story-teller might talk of a stingy and greedy old fellow, beginning something like this:

"We've got a lot of such fellows. They're stingy and like to give nothing to others, not even a show of their tongues to friends. But when it comes to getting, they're so greedy they don't mind an invitation to a funeral on Christmas Day.

"The other day a man was repairing a broken door. He needed a hammer and called his son, 'Say, go to the neighbour and borrow a hammer.'

"'All right, papa. I'll go.'

"'Will you kindly let my father borrow your hammer?'

"'Well, I may. But what does he want to knock with it, a bamboo nail or an iron nail?'

"'Iron nails, sir.'

"'Then, nothing doing. The hammer will wear off if he hits so hard a thing as iron.'

"'Did you get the hammer?'

"'No, I didn't. The neighbour refused to let you have it because he said it would wear off when you hit iron nails with it.'

"'Oh, stingy fellow. I can't help it. Then, bring out our hammer.'"

Such a story may not be interesting when written, but the professional story-teller relates it with sufficient art to amuse and keep his audience chuckling until the story comes to a smart ending.

The Cinema

Cinema theatres are to be found in all parts of Japan, whether in cities or hamlets, accommodating from 400 to 3,000 persons. The total number is 1,718. In 1933 total attendance at these movie houses was 175,041,793, including 38,017,666

Digitized by Google

children. They are equipped and managed very much after the manner of theatres in the West, and in architecture, especially in the large cities, they follow the American style. The pictures shown in them are Japanese, American and European.

Home and Imported Films In 1934, 103 talkie and sound pictures were produced by Japanese producers, of which 72 were talkies. The number of silent pictures was 297, a decrease of 100 as compared with the previous year. Imported talkies numbered 295, a gain of 15 over 1933.

Of the imported films released in Japan during 1934, those from the United States constituted over 85 per cent. of the total number. Details follow :

Country of production	Number of films
U. S. A.	251
Germany	21
France	9
Great Britain	6
Soviet Union	6
Italy	2
Total	295

The following table shows how they were distributed among leading producers :

Producer	Number of films
Paramount Famous Lasky	41
Fox Film Corporation	28
Metro-Goldwyn-Mayer, Inc.	36
Warner Brothers Pictures, Inc.	25
Universal Pictures Corporation	27
United Artists Corporation	10
RKO Productions, Inc.	35
Columbia	29

The largest and most influential motion picture producing and distributing companies in Japan are Shochiku Cinematograph Company, Ltd., Shinko Eiga Company, Ltd., and Japan Motion Picture Company, Ltd., the last being better known as Nikkatsu for short. Shochiku manages or supplies with pictures about 600 theatres, or half of the total in Japan, and all the rest are either managed or supplied with pictures by the other two and by foreign, especially American, companies. Japanese pictures in general are produced by distributing companies.

Characteristics of Japanese Pictures The substance of Japanese pictures is varied. The recent tendency favours a serious view of life, and audiences are more impressed by what is implied than by what is expressed. Scenes may be imposing, but if the meaning is shallow, the film will be disregarded. If the story is full of meaning, the picture, whether foreign or native, will catch the spectator's fancy. The Japanese people are fond of tragedy. With few exceptions, pictures without tears cannot be expected to prove financial successes. Especially the women, who constitute 50 per cent. of the spectators, feel disappointed if they have not shed tears over a tragic scene. Influenced by American pictures, comedies have come to be appreciated, but to satisfy the audience they must have at least 30 per cent. of tragic elements.

Talkies In talking pictures, Japan is much behind Western countries. Shochiku produces two a month, but the other companies combined turn out only one or two a year.

Practically all imported films are talkies. Their introduction presented language difficulties, for few Japanese understand English when spoken. As a solution, most of the American pictures now exhibited are so-called super-imposed prints, which flash a Japanese translation of the English dialogue in a corner of each scene. This has proved highly satisfactory to native audiences and has dispensed with the benshi, or interpreters, who are required for silent films, in the theatres which specialize in foreign talking pictures.

Radio

Introduced only 9 years ago, the radio has become one of the two most popular means of amusement in Japan, the other being the cinema. In March, 1934, more than 1,714,223 families in Japan proper have already become radio subscribers in Japan proper, which means that one home in every 8 has a receiving set. Programmes broadcasted by the 25 broadcasting stations scattered throughout the country are diverse, including weather reports, market reports, news and lectures. Entertainment is naturally the most popular.

Complex Programmes It is said that Japanese radio programmes are more complex than anywhere else in the world. Japan does not have a single and uniform culture; the old and the modern exist side by side, the indigenous and the foreign. Programmes, in consequence, must be arranged to meet divergent tastes, though ingenuity is sometimes taxed to satisfy everyone daily. The principal cleavage is in music. Japanese music, both instrumental and vocal, has developed in many varieties through many centuries. Just as in foreign countries listeners have preferences for classical songs, or violin solos, or orchestral music, or popular songs, or dance music, or chamber music, so in Japan there are preferences for particular kinds of Japanese music. On the other hand, the music introduced from Europe and America is fast becoming popular. Young people, who understand it, generally prefer Western music, and old people, who do not understand it, would rather hear the music they have known since childhood. The ideal programme, therefore, must combine them. If 30 minutes are given to music by the New Symphony Orchestra of Tokyo, 30 minutes must also be given to music that is purely Japanese. Statistics show that station JOAK in Tokyo broadcast a total of 227 items from April to December, 1933. Details follow: orchestral music, 56; vocal solos and chorus, 50; brass music, 30; chamber music, 13; violin solos, 9; piano solos, 20; jazz music, 9; foreign and Japanese music combined, 15; 'cello music, 3; flute solos, 3; pipe organ music, 2; guitar solos, 1; trumpet solo, 1; trombone solo, 1; xylophone solo, 1; and opera, 5.

Japanese Entertainment Purely Japanese entertainment is very varied. It includes singing of all kinds, from the nagauta, kiyomoto, naniwa-bushi and tokiwazu to all sorts of folk-songs, radio drama, story-telling, romance reading and descriptive accounts of athletic events.

Very little amusement is given in the daytime. The first radio entertainment of the day starts at 12:05 o'clock in the afternoon. It is usually of a lighter vein and may be Japanese or foreign music or a drama. If there is a major athletic event in the afternoon, a descriptive account usually goes on the air. After this, there will be no entertainment of any kind, except on Sundays, until 8 o'clock, when the principal amusement programme begins. Frequently, however, the children's programme, given at 6 o'clock for 30 minutes, has fairly good entertainment. From 8 to 9:30 o'clock, entertainment of all sorts is offered. Very rarely does the programme extend beyond 10 o'clock.

Programme and Listener The Japan Radio Broadcasting Association distributed 1,233,908 sheets of enquiries to its subscribers all over Japan in 1932, out of which 358,039 answers came, and the résumé of the investigation was given out in April, 1934. In the questionnaire there was a

Digitized by Google

column in which the listeners were requested to state what item or items of the programme they most liked and the answers given in percentage were as follows :

Item of programme	Percentage of listeners
News and reports	
General news	91.2
Time signal	77.5
Weather forecast	75.8
Radio gymnastics	48.0
Public announcements	42.3
Daily menues	31.0

Dramas for the young folks	52.5
Music	51.5
Stories	49.0

Horse Racing

It was after the Russo-Japanese War that the import of thoroughbred stud-horses and horse racing became encouraged for the improvement of horses in Japan. As the result the fever for the horse racing suddenly rose. At that time, a pari mutuel ticket was sold at ¥5, and unlimited dividends and sweep were allowed. The result was that many people fell into bankruptcy and abuses were too apparent, so that in 1909 horse racings which sold pari mutuel tickets were prohibited. But it soon became evident again that the decline of horse racings had an effect on the improvement and propagation of horses in the country. Ten years after, the Horse Race Bill passed the Parliament and became a law in 1923. The law fixed the price of pari mutuel ticket at ¥20 a sheet, and the race was ordered to be operated on the basis of "win". The number of pari mutuel tickets a person may buy was limited to one sheet. The dividend was also limited to ten times the cost of the ticket. The race courses provided under the law are eleven in all, the names and locations of which follow :

Name			Location
Sapporo	Race	Club	Sapporo, Hokkaido
Hakodate	,,	,,	Suburb of Hakodate, Hokkaido
Fukushima	,,	,,	Fukushima City, Fukushima Prefecture
Niigata	,,	,,	Niigata City, Niigata Prefecture
Nakayama	,,	,,	Katsushika-machi, Chiba Prefecture
Tokyo	,,	,,	Fuchu-machi, Tokyo Prefecture

Digitized by Google

Name			Location
Nippon	Race	Club	Yokohama City, Kanagawa Prefecture
Hanshin	,,	,,	Naruo-mura, Hyogo Prefecture
Kyoto	,,	,,	Yodo-machi, Kyoto Prefecture
Kokura	,,	,,	Suburb of Kokura City, Fukuoka Prefecture
Miyazaki	,,	,,	Miyazaki City, Miyazaki Prefecture

All of these clubs are corporate judicial persons. These eleven race clubs hold horse racings twice a year, in spring and fall, each of which covers from six to eight days. The money paid to the Government, the commission on sales, and the surplus of money are all used for the improvement and propagation of horses in the country as well as for the importation of the thoroughbred, Anglonorman and Arab horses. Since the losses of voters are large with "win" alone, "place" was added to the Horse Race Law and the horse race is carried on now on that basis since 1931. In all horse races in Japan, clubs themselves undertake the sales of pari mutuel tickets by the totalizator and do not recognize the bookmaker. It is being operated under the complete control of the Department of Agriculture and Forestry.

The above are the so-called officially recognized horse races, or horse races operated under the Horse Race Law. In addition to these, there are local horse races operated under the local horse race regulations.

There are 113 local horse races permitted in the country. A pari mutuel ticket costs ¥1. per sheet. Some of these are being operated on the combined basis of "win" and "place". Each person is permitted to purchase one each of "win" and "place" tickets.

The number of horses appeared in the officially recognized horse racings in 1934 was 1,733.

Derby in Japan The Great Tokyo Derby, which was established in 1932 by the Tokyo Race Club is modeled after Derby in Great Britain. The time set for it is the latter part of April. The race course covers 2,400 metres, the horses put up being both males and females of four years old. The prizes set up are the highest in Japan. The regular prizes are ¥10,000 for the first winner, ¥3,500 for the second, and ¥2,000 for the third. In addition to this there are given about ¥10,000 for the first, ¥4,000 for the second, and ¥2,500 for the third winner as stakes.

In the horse racing in Japan, canter, steeplechase, and trotting (trotting race driven to sulkies) are performed in a meeting. There is a distinction between a comer or non-subscription horse and a subscription horse. Subscription horses are those horses which are distributed to those members of the clubs by lot, each member paying comparatively a small fixed sum for it. This is a system established in Japan at the time when the interest of the people in the horse racing was not as keen as it is now with a view to increasing the number of the people who own horses.

As to the weight, the system is to fix it according to the amount of the prize. One kilogramme is added to a comer for canter race for every ¥3,000, while for a subscription horse one kilogramme is added for every ¥2,000. In each instance, the horse is withdrawn from the meeting if the weight exceeds 77 kilogrammes.

For a trotter a handicap of from 30 to 40 metres is placed for every ¥1,500.

Amusements Other Pastimes

Flower Cards The Japanese divert themselves by composing verses in their own language and in Chinese, and by playing chess, checkers, and various games of the "Mother Goose" description, of which sugoroku is the chief. Ever since the early days of foreign intercourse they have likewise had certain kinds of cards, of which the hana-garuta, or "flower cards", are the most popular kind, so popular, indeed, and seductive that there is an official veto on playing the game for money. The cards are forty-eight in number, four for each month of the year, the months being distinguished by the flowers proper to them, and extra value being attached to one out of each set of four, which is further distinguished by a bird or butterfly, and to a second which is inscribed with a line of poetry. Three people taken part in the game, and there is a pool. The system of counting is rather complicated, but the ideas involved are graceful.

Hyakunin Isshu There is another game of cards, in which stanzas from what are known as the "hundred poems", or hyakunin isshu, take the place of flowers. At this game no gambling is ever indulged in. It is rather an amusement for family parties, who at New Year time often sit up over it all night. Some of these diversions are shared in by the ladies.

Children's Sports The sports of Japanese children include kite-flying, top-spinning, battledoor and shuttlecock, making snow-men, playing with dolls, etc. The large, grotesquely coloured papier-mâché dogs given to babies owe their origin to some idea of the dog as a faithful protector, especially against onslaughts by evil spirits.

Shogi Japanese chess (shogi) was introduced from China centuries ago; and though it has diverged to some extent from its prototype, the two games still have a feature in common distinguishing them from all other varieties. It is this. The rank on which the pawns are usually posted is occupied by only two pieces, hisha and kaku by the Japanese. Also, on either side of the king are two pieces, called kin in Japanese. These perform the duty imposed on the ferz or visir of the Persian Shatranj, which was the equivalent of the modern queen. Therefore, no queen or piece of similar attributes appears either in Japanese or Chinese chess. There are eighty-one squares on the Japanese board, and the game is played with twenty pieces on each side, distinguished, not by shape or colour, but by the ideographs upon them. Though the movements of the pieces resemble in most respects those followed in the European game, there are certain ramifications unknown to the latter. The most important of these are the employment of the pieces captured from the adversary to strengthen one's own game, and the comparative facility with which the minor pieces can attain to higher ranks.

Chess is understood by all classes in Japan. The very coolies at the corners of the streets improvise out of almost anything around them materials with which to play, and thus away the tedium of waiting for employment. But it is comparatively little patronized by the educated classes, who hold its rival "go" in much higher esteem. O is the king, keima the knight, hisha the rook, and kaku the bishop—or pieces having movements like them. Fu is the pawn. The movements of the yari also resemble those of the rock, but are confined to the single rank on which it stands. Gin (silver) and kin (gold) are not found in Western

Digitized by Google

chess. Gin moves one square diagonally only. The kin, besides having similar movements, has also the power of moving one square on each side of itself, but it cannot return diagonally. The fu advances one square forward, and captures as it moves. When any piece moves into the adversary's third row, it may become a kin. This is indicated by turning the piece over. Every piece so promoted loses its original character, except the hisha and kaku to which the movements of the kin are added. As already indicated, a captured piece may be employed at any time for either attack or defence. To checkmate with the fu is a thing vetoed—or at least considered "bad form"—in this non-democratic game, neither is stale-mate permissible in Japanese chess. You wait until the adversary makes a move which admits of a free action on your part. The object of the game is to checkmate the king.

Go Go, often with appropriateness termed "checkers" by European writers, is the most popular of the indoor pastimes of the Japanese,—a very different affair from the simple game known to Europeans as Goban or Gobang, properly the name of the board on which the go is played. Clubs and professors of the art are found in all the larger cities, where, too, blind players may occasionally met with. Go may with justice be considered more difficult than chess, its wider field affording more numerous ramifications. The game was introduced into Japan from China by Kibino-Mabi, commonly known as Kibi Daijin, who flourished during the reign of the Emperor Shomu (A.D. 724-756). In the middle of the seventeenth century, a noted player, called Hon-im-bo, was summoned from Kyoto to entertain the Chinese ambassador then at the court of the Shogun, from which time forward special go players were always retained by the Shoguns.

Go is played on a square wooden board. Nineteen straight lines lengthwise and the same number of lines cross ways, crossing each other at right angles, make three hundred and sixty-one mé, or crosses, at the point of intersection. These may be occupied by a hundred and eighty white and a hundred and eighty-one black ishi or stones. The object of the game is to obtain possession of the largest number of mé. This is done by securing such positions as can be most easily defended from the adversary's onslaughts. There are nine spots on the board, called seimoku supposed to represent the chief celestial bodies, while the white and black stones represent day and night, and the number of crosses the three hundred and sixty degrees of latitude, exclusive of the central one, which is called taikyoku, that is, the primordial principle of the universe. There are nine degrees—or classes as we should term them—of proficiency in the game, beginning with number one degree as the lowest, and ending with number nine as the highest point of excellence attainable. In playing, if the combatants are equally matched, they take the white stones alternately; if unequal, the weaker always takes the black, and odds are also given by allowing him to occupy several or all of the nine spots or vantage points on the board,—that is, to place stones upon them at the outset. A description of how the game proceeds would be of little utility here, it being so complicated as to make the personal instruction of a teacher indispensable. Very few foreigners have succeeded in getting beyond a rudimentary knowledge of the game. The easy Japanese game, called gomoku-narabé, which was introduced into foreign countries, is played on the go

Digitized by Google

board and with the go-ishi. The object of this game is to be the first in getting five stones in a row in any direction.

Landscape Gardening Japanese landscape-gardening is one of the fine arts. Ever since the middle of the fifteenth century, generations of artists have been busy perfecting it, elaborating and refining over and over again the principles handed down by their predecessors, until it has come to be a mystery as well as an art, and is furnished—not to say encumbered—with a vocabulary more complicated and recondite than any one who has not perused some of the native treatises on the subject can well imagine. What the Japanese call hakoniwa or bonkei is a whole landscape-garden compressed into the miscroscopic limits of a single dish or flower-pot,—paths, bridges, mountains, stone lanterns, etc., all complete,—a fanciful little toy.

Cormorant Fishing Cormorant-fishing always takes place at night and by torch-light. The method pursued is as follows: There are four men in each of several boats, one of whom, at the stern, has no duty but that of managing his craft. In the bow stands the master called ujo, distinguished by the peculiar hat of his rank, and handling no fewer than twelve trained birds with the surpassing skill and coolness that have earned for the sportsmen of the Nagara River in Gifu prefecture their unrivalled pre-eminence. Amidships is another fisher, of the second grade, who handles four birds only. Between them is the fourth man, called kako, from the bamboo striking instrument of that name, with which he makes the clatter necessary for keeping the birds up to their work; he also encourages them shouts and cries, looks after square apparatus, etc., and is ready to give aid if required. Each cormorant wears at the base of its neck a metal ring, drawn tight enough to marketable fish from passing below it, but at the same time loose enough—for it is never removed—to admit the smaller prey, which serves as food. Round the body is a cord, having attached to it at the middle of the back a short strip of stiffish whalebone, by which the great awkward bird may be conveniently lowered into the water or lifted out when at work; and to this whalebone is looped a thin rein of spruce fibre, twelve feet long, and so far wanting in pliancy as to minimize the chance of entanglement. When the fishing-ground is reached, the master lowers his twelve birds one by one into the stream and gathers their reins into his left hand, manipulating the latter thereafter with his right as occasion requires. No. 2 does the same with his four birds; the kako starts in with his volleys of noise; and forthwith the cormorants set to at their work in the heartiest and jolliest way, diving and ducking with wonderful swiftness as the astonished fish come flocking towards the blaze of the light. The master must handle his twelve strings so deftly that, let the birds dash hither and thither as they will, there shall be no impediment or fouling. He must have his eyes everywhere and his hands following his eyes. Specially must he watch for the moment when any of his flock is gorged,—a fact generally made known by the bird itself, which then swims about in a foolish, helpless way, with its head and swollen neck erect. Thereupon, the master, shortening in on that bird, lifts it aboard, forces its bill open with his left hand, which still holds the rest of the line, squeezes out the fish with his right, and starts the creature off on a fresh foray,—all this with such admirable dexterity

Digitized by Google

and quickness that the eleven birds still bustling about have scarce time to get things into a tangle, and in another moment the whole team is again perfectly in hand."

Calendar of Annual Events

Few countries, if any, possess more ceremonies and more festivities than Japan. Some of these ceremonies at first sight may look absurd to the foreign eye, but familiarity with them and especially their origin will reveal most of them to be delightful. Rural people are more conservative than city folk in adhering to observance of ancient customs. Indeed, modern life has robbed the busy citizens of that quiet and poetical mood in which people of bygone days observed ancient customs, such, for instance, as moon viewing. But none the less it is true that despite the modern garb Japan wears today, the life of the present-day Japan is still associated with many picturesque customs and poetical sentiments of Old Japan, which afford a glimpse into the days of feudalism and the people continue to observe many of the customs handed down from time immemorial.

Below is given in chronological order a list of annual events in Japan, including ceremonies, festivals and other national customary observances.

January

January 1st New Year's Day—New Year's Day means as much to the Japanese as Christmas means to Western peoples, or probably more. It marks the beginning of new life in an atmosphere of quiet and gaiety, leisure and pleasure. It is a time to forget the cares of the past year and enjoy feasts and indulge in all sorts of amusement in celebration of the coming good and lucky year. The homes are decorated, both inside and outside; the people are clad in their best clothes, and they all look very happy.

The Imperial Household observes a religious ceremony called Shihohai (worshipping in four directions) at the Imperial Sanctuary according to Shinto rites. The Emperor usually officiates in person, offering prayers to the gods for the peace and prosperity of the Empire. New Year's Day is one of the three most important National Holidays of Japan, the others being the Imperial Birthday celebration and the celebration commemorating the anniversary of the accession of the Emperor Jimmu, the first Emperor of Japan, in 660 B. C.

The time-honoured custom of worshipping the sun-rise at shrine compounds situated in the "lucky direction" of the year is widely observed from the traditional belief that so doing will bring luck. Many, of course, observe this custom without showing the belief. The compound of the Meiji Shrine in Tokyo, for instance, is always filled with worshippers at dawn on New Year's Day. Ceremonies celebrating the New Year are also observed at all Shinto shrines throughout the country. On this day and the following two days people call on their relatives and friends and exchange New Year greetings.

2nd Beginning of Work—This day is known as shigoto hajimé, or beginning of work and is marked with ceremonies for the beginning of all sorts of activities which are to be executed properly and well in the right spirit, in the hope that

Digitized by Google

everything will go on in the same happy way for the rest of the year. Young school children study calligraphy for the first time in the year. Carpenters begin the day by using their professional tools. Geisha tune up their samisen and practise a piece or two of music. The first delivery of goods is undertaken by all wholesale stores in a spirit of celebration. The last named is called hatsu-ni, or first merchandise. Cars on which goods are to be delivered on this day are fully decorated, and the carriers and delivery men, usually drunk, enter into the spirit of the thing, although this custom is observed in recent years with less ostentation than formerly.

On the night of the second day, the people were supposed, in ancient times, to dream the first lucky dream of the year. To inspire such a dream, pictures representing the Seven Gods of Fortune were sold in the streets, to be placed under the pillow so that the sleeper might dream a desired dream. This custom has gone almost completely out of fashion.

3rd Genshi-sai, a national holiday, celebrating the auspicious origin of the Imperial Throne at the beginning of the year, is observed on the third day before the Imperial Sanctuary in the Imperial Palace. The ceremony is attended by the Emperor, members of the Imperial family, Princes and Princesses of the Blood, high officials of the Government and members of the peerage. In the morning the front of the Nijubashi, the bridge at the main entrance to the Imperial Palace, presents a glittering scene as the dignitaries of the nation arrive at the palace in their State uniforms to participate in the court function. The New Year holidays come to an end on this day.

4th Beginning of Politics—All normal functions of the State are resumed on this day and government and private offices re-open. The Ministers of State make various important reports to the Emperor, and the Minister of the Imperial Household also gives an account of the ceremonies performed at the Grand Shrine of Isé and the other government-protected shrines on the occasion of the New Year.

5th The Shinnen Enkai, or New Year Party, is held at the Homei Hall of the Imperial Palace, where the Emperor and Empress give a banquet to the Princes and Princesses of the Blood, Ministers of State, foreign diplomatic representatives and a large number of other dignitaries. The people in general also hold New Year parties and many persons are seen till a late hour on their way home from celebrations in a hilarious mood.

One of the most interesting features of Tokyo life on this day is the festival of the Suitengu shrine at Ningyo-cho. Here, right in the heart of the modern capital, a glimpse of old Japan reveals itself.

6th Tokyo fire-brigades assemble in an open space in front of the Nijubashi for the New Year parade and give acrobatic performances on fire-ladders to show their agility. There was a time in the old days when fires were so frequent in Yedo (Tokyo) as to be called "the flowers of Yedo." The life of the fireman was envied by many as inspiring. The performance of acrobatics was initiated in those days to reassure the public by demonstrating the efficiency of firemen when confronted with danger.

Cold season begins—The so-called kan, or cold season, begins its conventional period of four weeks. The cold season is divided into two stages, the period of shokan, or lesser cold, and the period of daikan, or greater cold. During the period many male apprentices and

Digitized by Google

artisans devoted to their work go out thinly clad in the evening to worship at their favourite temples, having the traditional belief that divine power invoked by their enthusiasm will make them proficient in their callings. They go to the well in the temple compounds and pour cold water over their bodies to purify themselves before worshipping at the temples. The rite is practised for the whole period every evening without a break, irrespective of weather conditions. Such enthusiasts, dressed in white clothes and usually with tinkling bells hanging over their loins, can be seen in the streets during the cold season, running from temple to temple.

Decorations removed—All New Year decorations should be removed from the house fronts before nightfall, as the main New Year celebrations come to an end.

7th The Seven Herbs—On this day, known as nanakusa (seven herbs), people eat rice gruel mixed with seven kinds of herb. This custom originated in the days of the threatened Mongolian invasions under Kublai Khan. The herbs were deemed to give strength to the Japanese soldiers, and they are now supposed to give strength to all consumers against the nation's enemies.

8th Military Review—The Emperor reviews the troops of the Imperial Bodyguard at the Yoyogi parade ground. The public can witness the review.

10th The Kompira shrine holds its festival on this day. The shrine is located at Toranomon in Shiba, Tokyo. A feature of the festival is a fair at which many talismans are sold.

11th The Kodokwan, the celebrated judo training institution in Koishikawa, observes the ceremony of beginning judo practice for the year. The greatest experts in the art of self-defence participate in the ceremony, at which the finest matches of the year are seen.

12th Sumo (Japanese wrestling)—The semi-annual tournaments of the Japan Wrestling Association are held at the Kokugi-kwan amphitheatre at Ryogoku, Tokyo, in January and May. Each tournament lasts for 11 days. (See Chapter XXXVI.)

15th and 16th Extra holidays for apprentices and servants—in old days apprentices and servants were given only two days' holiday a year, January 15 or 16 and July 15 or 16. Nowadays they are given at least one holiday a month in many cases, but the old custom is still adhered to especially in country districts.

February

February 1st Country people, adhering to the lunar calendar, celebrate the New Year on this day.

3rd or 4th The Bean-throwing ceremony—This day is called setsubun, or change of the season, on which winter comes to an official end and spring begins according to the lunar calendar. Mamemaki, or the bean-throwing ceremony, is widely practised throughout the country. People scatter beans in an attempt to drive out all the evil spirits in the house and call in good luck. The priests of leading shrines and temples observe this custom in the presence of thousands of worshippers. Usually popular actors and wrestlers are employed as bean-throwers.

11th Commemoration of the Accession of the Emperor Jimmu—This national holiday, Kigensetsu, commemorating the accession in 660 B. C. of the first Emperor of Japan to the Throne, is one of the most important in the Japanese calendar. The Emperor observes elaborate ceremonies in front of the Imperial

Digitized by Google

Sanctuary, attended by the Empress, Princes and Princesses of the Blood, court functionaries and high officials of the government, and peers. An Imperial luncheon is given at the Homei Hall of the Palace, to which are invited the Princes and Princesses of the Blood, State Ministers, members of the foreign diplomatic corps, etc.

March

March 3rd Girls' Doll Festival—This is sometimes known as the peach festival, because it is associated with the peach blossoms which begin to open about this time. This day is a great day for the girls of Japan. All families, except the poorest, place decorated doll shelves in the guest rooms or alcoves with a set of dolls and accessories on them. Very often the dolls are taken out from the closets and displayed for the enjoyment of the young girls of the family. The set of dolls is supposed to represent a miniature court of ancient days with the Emperor, Empress, and their retainers. Some of the sets in wealthy families are valuable, costing several hundred yen each. Dolls are displayed for sale at department stores and stalls about a month before the arrival of this festival. Considerable religious significance was originally attached to the doll festival, but later it became a mere pastime for children. It is said by some that the custom encourages happy family life, and by others that it encourages the spirit of filial piety and loyalty. Scholars declare that the custom originated during the reign of the Emperor Tsuchimikado (1199-1207).

6th The Empress's Birthday—This day is known in Japanese as Chikyu-setsu, and is a holiday for girls' schools.

18th Higan, the Week of the Equinox, is a busy time for Buddhist families. Usually, all members of the family visit the family graveyard during the week, attend to the tombs and offer prayers to the spirits of their ancestors. Higan, literally translated, means "yonder shore," or Nirvana. Various eatables of vegetable substance, specially prepared for the purpose, are offered to the dead and sent as presents to friends and relatives. All Buddhist temples in the country hold special services during the period. Tokyo old-fashioned Buddhist believers make special pilgrimages to the images of the six-faced Amida Buddha at 18 temples situated in the hilly sections of the city and suburbs.

21st Vernal Equinox Festival—On this national holiday, which is called Shunki Korei-sai, all schools and public buildings are closed. A Shinto festival in memory of the Imperial ancestors and ancestresses is performed at the Imperial Sanctuary.

April

April 3rd Anniversary of the demise of the Emperor Jimmu, national holiday—This day is the anniversary of the demise of the first Emperor Jimmu, who reigned over the country for 76 years. The Emperor performs an appropriate ceremony in front of the Imperial Sanctuary.

8th Birthday of Gautama Buddha—This day, marking the birth of Gautama Buddha, is celebrated by all Buddhist temples throughout Japan. Leading temples hold parades of young girls who are daughters of Buddhist believers, and hold memorial services in honour of the founder of their religion. Amacha, sweet tea, is freely given at the temples to all visitors.

18th Festival of the Tokugawa Shogunate Shrine—A festival is held at the Toshogu shrines at Ueno park

Digitized by Google

and Shiba park, which are dedicated to the Tokugawa Shoguns.

29th Emperor's Birthday—One of the three greatest national holidays, commemorating the birthday of the Emperor Hirohito, the 124th ruler of Japan. A service is held at all elementary and second grade schools in Japan. At the Imperial Court the Emperor and Empress hold special ceremonies in front of the Imperial Sanctuary, offering prayers to the spirits of the Imperial ancestors for the peace and prosperity of the Empire. After the function, the Emperor reviews the army at the Yoyogi parade-ground. An Imperial banquet is held, to which high officials of the government and foreign diplomats are invited.

30th Semi-Annual Festival of the Yasukuni Shrine—The semi-annual festival of the Yasukuni shrine, on Kudan hill, Tokyo, dedicated to the spirits of the officers and men of the army and navy and others who died fighting for their country in the wars since the Meiji Restoration, lasts for 3 days beginning on April 30.

May

May 1st May Day—This imported festival for labourers is observed usually with a labour mass meeting at Shiba park, followed by a huge parade throughout Tokyo. Similar celebrations are held in other leading cities.

5th Boys' Doll Festival—Just as March 3 is for girls to celebrate their doll festival, so this day is dedicated to the boys of Japan. All Japanese families having sons observe this classic festival. Dolls for the festival are on display in the alcoves of the guest rooms of the families to wish health, success and prosperity to the boys. The sets of dolls displayed represent popular heroes of the Empire. The custom is of several centuries' standing and was originated to encourage a martial spirit in boys. In former days, and even now in some of the rural districts, large paper or cloth carps, often several yards long, are hoisted above the houses, symbolizing the idea that the sons of the families will be as strong as the spirited carp trying to swim up a waterfall.

June

June 1st Ayu fishing season—The seasonal ban on Ayu fishing is formally lifted on this day and anglers in Tokyo flock to the Tama and Sagami rivers to fish ayu, or sweet trout, a fish noted for its fragrance and delicious taste. A feature of the season is the picturesque cormorant fishing on the Nagara near Nagoya.

14th and 15th Annual Festival at Hiyé Shrine, Tokyo—Representative of many shrine festivals which take place in Tokyo and elsewhere in Japan is the annual festival of the Hiyé shrine, known as Sanno-sama, which takes place on top of the Sanno Hill in Akasaka ward. The mikoshi, or portable shrine, is carried on the shoulders of shrine hands through Kyobashi, Shiba, Kojimachi and other wards over which the deity "reigns."

17th Annual Festival of the Great Shrine at Isé and the Itsukushima Shrine at Miyajima.

21st Annual Festival of the Atsuta Shrine at Atsuta, Owari province.

July

July 1st Season for climbing Mount Fuji—The season for climbing Mount Fuji opens. A service is held at the Sengen shrine on top of the sacred peak.

7th Feast of Tanabata—This evening the Weaver or the Star Vega meets her lover the Cow-herd or the Star Altair on the other side of the Heavenly River (Milky Way)

Digitized by Google

on the only occasion in the whole year, according to tradition. This festival of the seventh eve of the seventh month is celebrated by some although this custom has of recent years been more or less neglected in Tokyo and other cities.

13th—15th O-Bon Festival—During the o-bon, or feast of lanterns, tradition says that the spirits of the family ancestors and other dead members of the family visit the family and due welcome is given them according to Buddhist rites. The family tombs are visited and vegetable sacrifices are offered. People make small bonfires of stripped hemp stalks and light lanterns to guide the spirits of their ancestors into their homes.

Bon odori, or dance of the bon season, is a simple folk dance which is given in the compounds of temples or elsewhere by common people, especially in the rural districts, under the light of lanterns.

15th and 16th Extra holidays for apprentices and servants—Semi-annual holidays are given apprentices and servants on either of these two days, as on January 15 and 16.

17th Annual fête of Gion Shrine in Kyoto—This picturesque shrine festival in the ancient capital of Japan lasts for a week.

21st Hottest season — The doyo, the hottest period of summer, begins today or thereabouts, to last for about three weeks.

August

August 4th Annual festival of the Kitano Shrine in Kyoto.

6th Annual festival of the Sumiyoshi shrine in Tsukudashima, Kyobashi.

16th Annual Bon-fire Fête on Mount Nyoi in Kyoto.

19th Lantern Fête on Mount Atago in Kyoto.

September

September 1st Memorial Service for the Earthquake Dead—to comfort the spirits of those who were killed in the great earthquake and fire of 1923 services are offered at the Earthquake Memorial Hall at Honjo on the banks of the Sumida River.

5th Suitengu Shrine Festival in Tokyo.

13th Festivals of Kanda Myojin and Hikawa shrines in Tokyo.

17th and 18th Festival of the Great Shrine at Isé and the Hokoku Shrine in Kyoto.

20th Week of the equinox begins—the autumn higan begins on September 20. As during the spring equinoctial week Buddhist temples present busy scenes.

23rd Festival of the autumnal equinox—A Shinto festival in memory of the Imperial ancestors is performed at the Imperial Palace, the day being a national holiday.

26th Moon-viewing Festival—The custom of moon-viewing is no longer observed so generally as in the past, but it still delights the poetically minded in the cities, and people in general in the rural districts. Before twilight sets in, the house-wife will bring a table to the veranda where it can catch the moon beams and spread upon it a feast in honour of the moon. A vase containing autumnal flowers will be placed on the left side of the table. As the moon rises, the members of the family sit around the table in the moonlight and spend the evening in merry-making.

October

October 10th Annual fête of the Kotohira Shrine in Sanuki province and also of similar shrines in Tokyo and elsewhere.

Digitized by Google

13th Anniversary of the death of St. Nichiren—One of the most elaborate Buddhist demonstrations in Japan is held in the evening (at the Hommonji temple at Ikegami, Tokyo) to commemorate the anniversary of the death of St. Nichiren, founder of the Nichiren sect of Buddhism. Thousands of believers and non-believers march in groups to the temple, each beating a drum so as to keep time, shouting all the time the Buddhist sutra, "Namu-Myoho Renge-kyo." Large paper lanterns, all lighted, are carried at the head of those processions.

15th Hunting season—The ban on hunting in all districts is lifted today.

17th On this national holiday, which is Kannamé-sai (first harvest festival) the Emperor makes an offering of the new grain harvested this fall to the Sun Goddess enshrined in the Grand Shrine at Isé and to other Imperial ancestors. A special service is held at the Imperial Sanctuary, while the Emperor dispatches a messenger to the Grand Shrine to offer prayers on his behalf.

22nd Festival of Yasukuni Shrine—The Yasukuni shrine begins its second semi-annual celebration, lasting for three days.

November

November 2nd Festival of Oh-tori shrines—the annual shrine festival known as tori-no-ichi, is observed at various shrines of Oh-tori, a winged god of fortune and wealth in Tokyo and elsewhere.

3rd Celebration of the Emperor Meiji's Birthday—This is a national holiday and all schools and public buildings are closed in honour of the great Emperor during whose reign Japan became a world Power, and the week is kept as a national athletic week.

8th Festival of Bellows—This is celebrated in the household of every metal-smith, silver-smith, iron-smith, and the like. On this day also takes place the annual bonfire fête of the Fushimi Inari shrine in Kyoto and elsewhere.

15th Celebration for children of 3, 5 and 7 years of age—This is known as "shichigosan (7, 5, 3) festival". On this day boys who have attained the age of 5 years and girls who attained that of 3 or 7 years of age are taken to the shrines of their tutelary deities, in their best clothes, and worship at the shrines by way of expressing their gratitude for the protection of the guardian deities and their safe growth throughout the period of early childhood, at the same time beseeching future protection and happiness.

23rd Festival of Niinamé-sai—The Emperor observes Niinamé-sai, a national holiday, with the ancient court ceremony of offering new grain to the Sun Goddess and other Imperial ancestors, and partaking of it himself. The occasion is one of thanksgiving, when the Emperor and his subjects return thanks for the harvest.

28th Anniversary of the death of St. Shinran—A religious fete in commemoration of the death of St. Shinran, founder of the Shin sect of Buddhism, is celebrated at the Hongwanji temples in Kyoto and Tokyo.

December

December 22nd Winter Solstice—On this day people take baths in hot water in which sour oranges have been placed, according to the time-honoured custom.

25th Anniversary of the death of Emperor Taisho, father of the present Emperor, a national holiday.

Digitized by Google

25th Christmas — Christmas has become an important affair for the Japanese living in cities. Although at first it was regarded by the general public as an event entirely foreign to Japan, it has now become a season of rejoicing for children in large cities, and the day is a regular annual feature, included in the Japanese calendar as such.

29th Close of official business—All government and public offices close for the year-end and New Year holidays.

31st Eating of noodles on the last day of the year—It being the last day of December, many businessmen eat noodles at their evening meal to bring the year to a happy conclusion. The noodle is regarded as a symbol of long life and continued prosperity.

CHAPTER XXXVIII

TOKYO

Historical Sketch

In 1192 Yoritomo Minamoto (See Chapter III, Kamakura Age) established a military régime at Kamakura, 56.33 kilometres south-west of the present Tokyo, and it was at this period that the name of Yedo was recorded in the report of a local war in which a son of Lord Shiro Kanetsugu Yedo took part, and the name seems to have been given before he became the lord of the district. Yedo literally means "entrance to the gulf."

After the fall of the Yedo family the district was occupied by a feudal lord called Sadamasa Uyesugi; and Dokan Ohta, one of his retainers, discovering the strategic importance of Yedo constructed the Yedo castle which was completed in 1457. After changing hands a few times, it fell, in 1590, into the possession of Iyéyasu Tokugawa, who settled down there to be the over-lord of the eight provinces of Kanto. From that time it gradually expanded until it became not only the capital of Kanto but the seat of the Tokugawa Shogunate during 15 generations. During the 268 years of the Tokugawa Shogunate the obscure village of Yedo became a thriving town and it is said that 2 million people lived there in the height of its prosperity in the Bunsei (1818-1830) and Tempo (1830-1844) eras.

In 1869 the Emperor Meiji transferred the Imperial capital to Yedo and renamed it Tokyo, or Eastern Capital. Then came still further growth and prosperity. Contact had just been made with Western countries and as Tokyo was serving as the gateway for Western civilization much attention was given to building the city on modern lines.

The fifty years of Tokyo culture met with a terrible catastrophe in September, 1923, when earthquake and fire, unprecedented in history, dealt the city an almost fatal blow. Nearly one-half of the entire city was completely reduced to ashes. But with hard work and the enthusiastic support of the whole country and the citizens of Tokyo, as well as the sympathy of the world, a new and better Tokyo has arisen from the ashes in but a decade.

Location and Climate

Tokyo is situated at the south-east corner of Kanto plain in 35° 31′ 59″-48′ 50″ N. latitude, 139° 33′ 56″-55′ 22″ E. longitude. The climate of the city is generally mild; the annual mean temperature is 13° 9′ C (57° F); the mean temperature in July is 24° 2′ C (75° 5′ F), in January 3° 1′ C (37° 5′ F); the annual average precipitation is 1,574 mm.

Population and Area

Growth of Population The growth of the population of the city will be seen from the following:

Year		Population	Household
1878		813,400	235,943
1888		1,298,661	287,833
1898		1,425,366	316,527
1908		1,626,103	376,428
1920	(census)	2,173,200	456,816
1923[1]		1,527,489	340,278
1924		1,926,310	417,833
1925	(census)	1,995,567	429,852
1930	(census)	2,070,918	414,710
1931		2,085,560	417,950
1932		5,311,930	1,188,220
1933		5,486,200	1,176,810
1934		5,662,900	—

1 Earthquake year.

Digitized by Google

Population On October 1, 1934, the estimated number of population in the city of Tokyo was 5,662,900, or 10,222 per a square kilometre. Of the total, 2,983,400 were men and 2,679,500 women.

Natural Increase in 1933 The number of births in 1933 was 134,850 or 24.48 per 1,000 of population, while that of deaths in the same year was 82,405 or 15.02 per 1,000 of population, and the natural increase was 52,445.

Buildings and Dwelling Houses At the end of 1933 there were 917,147 buildings and dwelling houses in Tokyo, of which 42,951 were built in the year. Of these new ones, 4 were of stones, 550 of steel or reenforced concrete, and buildings higher than 4 stories numbered 66.

Area The total area of Tokyo on January 1, 1933, was 553.967 square kilometres. Classified according to ownership, figures follow:

Ownership	Area in sq. kilometre	Percentage
Imperial Household	6.330	1.13
State	67.614	12.07
Municipality	12.237	2.50
Private persons	392.427	70.70
Rivers, etc.	75.358	13.60
Total	553.967	100.00

Tokyo Enlarged

The development of modern Tokyo is best endorsed by the giant growth of the adjoining towns and villages.

Socially and economically the towns outside the city area have been closely connected with the city itself. The position regarding Tokyo during the 10 years ending 1930 was that the 82 adjoining towns and villages increased in population by 1,720,000, while the city of Tokyo lost 100,000 within the same period. In road construction, extension of communication facilities and in the execution of various municipal regulations the city experienced enormous difficulties due to the existence of over 80 different self-governing bodies surrounding the city area.

As is generally the case with great cities, a large number of people living in adjoining towns enter the city to earn their living. They are placed on exactly the same footing with the citizens in so far as the utilization of metropolitan facilities is concerned. Besides, as most of them are salaried men belonging to middle or intelligent class, to let them stand aloof from city government means an enormous loss to both.

It was after taking into careful consideration all these practical phases of administration that on October 1, 1932, new Tokyo was founded by amalgamating 20 more wards. The newly annexed suburban towns have 3,211,580 inhabitants and 469,029 sq. km., a density of 9,034 persons to the square kilometre.

The enlarged Tokyo now covers 553.967 square kilometres divided into 35 wards.

Commerce and Industry

Retail Business In 1931-32 the number of retail dealers in Tokyo was 156,208; of the total the dealers who carried on their business with a capital under ¥1,000 comprised 22.1 per cent., under ¥5,000 40.1 per cent. and above ¥5,000 37.8 per cent. the position of various classes of dealers in the retail market in the city is shown below:

AMOUNT OF SALES BY RETAIL DEALERS IN TOKYO (1931-32)

Class of dealers	Number of Shops	Sales Amount (in ¥1,000)	Percentage
Department stores	36	235,678	24.5
Corporations	2,526	103,368	10.8
Individuals	132,922	561,575	58.5
Retail markets			
Municipal	11	1,768	0.2
Prefectural	34	6,526	0.7
Private	533	37,445	3.6

Digitized by Google

Class of	Number of Shops	Sales Amount	Per-centage
Consumption associations	50	7,707	0.8
Stalls and venders (estimate)	14,000	6,000	0.6
Total	156,208	957,867	100.0

Public Wholesale Markets The city owns and controls the Central Wholesale Market the construction of which has just been completed on 196,741 sq. metres of land at a cost of ¥15,000,000 and opened its business in September 1934. The market is for fish, poultry, meat, vegetables and fruits. Estimated quantity and value of the commodities to be handled in a year in this market are as follows :

Fish	207,000 tons
Dried fish	66,000 ,,
Meat	3,000 ,,
Poultry	1,700 ,,
Eggs	11,000 ,,
Vegetables	88,000 tons
Fruits	52,000 ,,
Total	428,700 ,,
Value	¥106,700,000

There are two branch wholesale markets under municipal ,control. They are the Kanda and Koto markets, and both handle only vegetables and fruits.

In the newly annexed city area 4 new branch markets are to be constructed.

Industry A thorough investigation was carried out by the municipality as regards the conditions for one year of all the factories, including small ones which employ less than 5 persons, as they stood in July, 1933. According to the investigation the total number of factories in Tokyo was 84,298 ; details follow :

Factories in Tokyo Classified According to the Number of Operatives and their Production

Number of Operatives	Number of Factories	Amount of Production (in ¥1,000)	Income from Subcontracted works	Percentage Factories	Production	Subcontracted Works
1	14,105	11,255.5	6,027.4	16.7	1.1	4.7
2-4	50,468	117,147.0	32,551.5	59.9	11.0	25.4

Transportation

In 1932-1933 the number of daily passengers carried by all the transportation facilities in and around the city of Tokyo was estimated at 3,146,000, aggregating to an enormous number of 1,148,424,000 in the year.

CONVEYANCE OF PASSENGERS BY DIFFERENT TRANSPORTATIONS

	Municipal Electric Car	Governmental Electric Railways	Subway	Private Electric Railways	Buses	Taxicabs (Estimate)	Total (Estimate)
1928-29	445,085,238	334,156,565	8,192,524	231,822,109	92,100,103	55,047,000	1,165,912,539
1929-30	421,190,264	333,543,611	7,676,447	244,603,742	118,778,292	89,966,000	1,220,758,356
1930-31	369,737,708	322,461,593	10,041,945	235,250,177	106,640,640	95,112,000	1,139,244,063

1932-33	300,777,666	327,768,000 (estimate)	14,438,676	227,218,397	661,954,398	106,267,000	1,148,424,137

Electric Railways The results of the operation of municipal electric railways in 1933 show that passengers carried were 295,667,416 and the revenue therefrom ¥18,853,506. Compared with the previous year, the number of passengers decreased by 5,110,250 and the fares by ¥344,619. This decrease is due to the continued depression and to the development of other advanced transportation facilities.

REPORT ON ELECTRIC RAILWAYS

(1928-1933)

Year	No. of passengers	Fares collected (Yen)	Year	No. of passengers	Fares collected (Yen)
1928	445,085,238	29,078,051.90	1931	335,439,992	21,562,315.78
1929	421,190,264	27,201,754.01	1932	300,777,666	19,198,125.00
1930	365,236,868	23,573,915.31	1933	295,687,416	18,853,506.00

Motor Bus It was in January, 1924, the year following the great earthquake, that the motor bus service was started as a temporary measure to meet the transport emergency, but its development was so healthy that it was decided to put it into permanent operation.

MUNICIPAL MOTOR BUS

At the end of	Mileage in Operation	Number of Cars	Number of Passengers	Passengers per Day	Fare (yen)	Fare per Day (yen)
1928	102.6	592	41,571,352	164,008	4,013,547	10,996
1929	112.1	592	43,582,279	164,777	4,038,891	11,065

Digitized by Google

Underground Railways The urgent need of a high speed underground communications to relieve the congestion and pressure of surface traffic has long been felt necessary. A private company opened its first section of an underground railway, from Asakusa to Ueno, in the latter part of 1927, and is pushing forward its line under the very centre of the city to Shinagawa. It completed the construction of the line to Shimbashi in June, 1934, and the distance in operation now is 8 kilometres. In 1933 it carried 17,795,433 passengers. The municipal authorities have under contemplation the construction of other lines totalling 65 kilometres and by the end of 1930 had completed geological survey borings in 367 places.

Streets The ten years' effort after the earthquake of 1923 transformed the roads in Tokyo to a great extent and 89.4 per cent. of the total area of roads in the old city section is paved, although in the new city section the percentage of the paved roads is only 29.3. Within the coming ten years 180 lines of roads will be constructed or paved according to the city construction plan.

Bridges The city of Tokyo has a network of rivers and canals and the beauty of the city is greatly enhanced by the bridges of manifold designs which traverse them. Before the earthquake the bridges under municipal management numbered 668, of which 426 were of wood. At the earthquake 289 bridges collapsed or were reduced to ashes. By the co-operation of the Reconstruction Bureau of the Government and the Municipality new bridges were built in their place. At the end of 1933 there were 4,588 bridges in Tokyo, 1,264 of which were of stone, 107 concrete, 958 reinforced concrete, 533 iron, 66 iron and wood, and 1,660 wood.

Rivers and Canals The city is served with a veritable network of canals and rivers many of which are used for transportation purposes. Dredging has to be carried out continuously to keep them navigable. In 1933 there were 5,505 canals and rivers with the total length of 2,280,603 kilometres.

Harbour At the time of the great earthquake in 1923 the city of Tokyo keenly felt the necessity of better facilities for maritime transportation, and when rebuilding of the city took place it was decided to construct a pier, sheds and warehouses at Shibaura, Tokyo. A sum of ¥18,000,000 was appropriated for the work and construction was completed in April, 1935. The length of the reinforced concrete Hinode-cho pier is 564 metres and six steamers of 1,000 to 3,000 tons can be moored alongside at a time. Another pier of Shibaura has a length of 910 metres and can moor 7 steamers of 6,000 tons. Furthermore, there are 12 mooring buoys and 8 sheds. The total area of he harbour is 8,591 square kilometres. During 1933, the total number of steamers entered was 2,904 with an aggregate tonnage of 6,587,307 tons. The harbour handled 4,469,245 tons of import cargo, and 596,382 tons of export cargo.

Waterworks

The construction of modern water reservoirs was first commenced in 1890 and it was twenty years before the Yodobashi water reservoir was completed. But this proved inadequate to meet the ever growing water consumption and the Murayama water reservoir was constructed in 1916. It consists of two reservoirs, upper and lower, and the upper reservoir has a capacity of 3,576,000 cubic metres while the capacity of the lower one is 12,148,000 cubic metres.

Digitized by Google

In 1934 another reservoir at Yamaguchi-mura was completed and it has a capacity of 18,824,000 cubic metres. The total volume of water which can actually be maintained by these reservoirs at any given moment reaches 30,056,000 cubic metres. The total volume supplied during 1933-34 was 120,354,969 cubic metres. Another reservoir, six times as large as the combined Murayama and Yamaguchi reservoirs, is to be constructed in the neighbourhood of Ogōchi-mura in Tokyo prefecture. In March, 1935, the city bought all rights of the Tamagawa Waterworks which had been supplying water to the six southern wards.

Sewerage Works

General Conditions Until half a century ago waste water used to be discharged into moats, navigable canals and rivers. In 1876, there was a violent outbreak of cholera which impressed upon the Government the urgent need of a general water and sewerage system, but it was not until between 1883 and 1885 that Tokyo prefecture laid the first sewers, with a government subsidy. The subject of sewage disposal was not undertaken in earnest until 1911, and it was not until ten years later that the modern Mikawajima Disposal Works were opened. Extensions and modernization are still going on. At present there are 7 sewage siphons at Sunamachi and Mikawajima.

Within the old city limits there are no longer any open street drains visible, the same, unfortunately, cannot be said of the new city area, though further development of the sewerage system is being planned.

Sewage siphon and disposing capacities for 1933-34 follow:

SEWERAGE WORKS IN TOKYO

(1933-1934)

	Area covered (in are)	Length of sewers (in metre)	Sewage siphons	Sewage farm
Proposed				
Old City Section	699,206	1,720,997	7	3
New City Section	1,761,466	816,633	6	2
Completed (1933)				
Old City Section	—	774,507	7	2
New City Section	—	200,944	—	—
Under Construction (1934)				
Old City Section	—	91,077	3 (Additional)	1
New City Section	—	66,734	4	—

Parks

Parks The absolute necessity of parks is more keenly felt in Tokyo than in other cities in Japan, not only because they are like oases in a large city, but because many lives were saved through the existence of parks on the occasion of the terrible earthquake of September, 1923.

At the end of 1934 Tokyo had 105 parks with an area of 2.747 square kilometres.

In the old city area there are three large parks: Sumida, Kinshi and Hamacho and 89 others of about 2,682,136 sq. m., whereas before the earthquake the city had only Ueno, Hibiya and 32 other parks. Within the newly annexed quarters of the city there are two at Shinagawa covering an area of 3,900 tsubo.

Sumida park has an area of 174,400 sq. m., Hamacho park 36,000

Digitized by Google

sq. m. and Kinshi park 56,000 sq. m. All of the numerous small parks are laid out adjoining the elementary schools. They serve as local parks, the largest being 4,700 sq. m. and the smallest 1,700 sq. m. in area.

Education

Most kindergarten work is undertaken by private persons, only 47 of the 278 kindergartens were being under municipal management in 1933. Elementary education, with the exception of a very few schools, is undertaken by the municipality. In July, 1934, there were 544 municipal elementary schools with 705,020 pupils. In addition to the elementary schools there are evening elementary schools, with courses extending over three years for poor children who are unable to attend day school. They are all municipally established and pupils who complete the course are recognized as having finished their compulsory education. In July, 1934, the number of evening elementary schools and their pupils was 69 and 5,613 respectively.

For secondary education the municipality have 2 middle schools, 4 girls' schools, 10 commercial schools, and 4 industrial and business schools. (For the municipal educational expenditure see "Finance".) Education of a supplementary nature, industrial, commercial or technical is well looked after, as the following statistics will show.

All the higher education in the city is carried out by the Government, Tokyo Prefecture and private educational bodies.

ELEMENTARY AND SECONDARY SCHOOLS

March 1, 1934

	No.	Instructors	Students	Graduates
Kindergartens	275	621	15,205	9,124

Social Education The Social Education Bureau of Tokyo municipality, established in 1921, looks after the social education of the capital.

Digitized by Google

Adult education is effected through the medium of Commercial and Industrial Young Men's Cultural Schools and citizens' lecture courses, both of which give lectures to citizens for a term of half a year, at night or on Sundays and holidays. At other times short time lecture or training courses are arranged for citizens in general. Free use is made of music and the cinema.

The Tokyo Self-Government Hall, Hibiya park, is a permanent organ for social education with the object of fostering an autonomous spirit among the citizens, as its principal raison d'être.

Training of Young Men In July, 1934, there were 26 Young Men's Training Institutes with 15,599 students.

The Tokyo Municipal Federated Young Men's Association represents the Young Men's Associations of the different wards. Besides being subjected to physical and mental training the members are expected to render assistance in all public welfare services. In 1934, there were 1,012 such associations in the federation, the total number of members being 106,963.

In September, 1934, the Tokyo Municipal Federated Young Women's Association had 464 groups with a Association had 464 groups with members of 41,518.

The Tokyo Federated Boy Scouts movement was established in 1922. It made rapid growth and in August, 1934, the number of groups was 161 with 9,397 members.

Public Libraries There are 26 libraries owned by the municipality, 8 of which are open day and night, but the rest, being attached to elementary school buildings, are open after school hours. In 1934, the number of books kept in these libraries totalled 425,724 and that of visitors was 2,690,216. The Hibiya Library is the oldest and largest, being established in 1906 and keeping 164,464 books. There are also some noted libraries in the city such as the Ueno Library (State), Tokyo Imperial University Library, libraries attached to universities, as well as many private libraries, of which the noted one is Ōhashi library. Statistics of the number of all the libraries in Tokyo, books kept, the number of visitors, etc. follow:

STATISTICS OF LIBRARIES IN TOKYO

March 1, 1934

No. of new books	131,445
No of total books	3,136,583
Visitors	6,799,423
Total no. of libraries,	54

Religion

The number of shrines, temples, churches and missions, and that of preachers and adherents of each religion follows:

NUMBER OF SHRINES, TEMPLES, CHURCHES

(December 31, 1933)

	No. of shrines, temples, churches, and missions	No. of preachers	No. of adherents
Shintoism	861	346	—
Missions for Shintoism	1,007	6,032	557,709
Buddhism	1,863	4,300	258,706*
Missions for Buddhism	224	341	78,226
Christianity	223	447 (Includes 81 foreigners)	54,435

* Refers to the number of Buddhist households.

Social Work

Child Welfare There are 4 maternity and 3 infants' hospitals within the old city quarters. In 1933 the former took care of 4,358 expectant mothers and the latter 7,351 infants.

There are 18 municipal nurseries where labourers can leave their children when going to their daily work. Those taken care of are babies from 6 months old to school age. In 1933 they took daily care of 1,135 children.

The city has 16 Infant Welfare Centres which give advice on the rearing of babies, arrange mothers' meetings and exhibitions on infant hygiene and assist in supplying fresh milk for babies of the poor at a reduced price or gratis. In 1933 these centres handled 4,947 cases.

The city established the Tokyo Juvenile Shelter Office in 1921 to give social protection to those youths who are in need of public care, such as those who are unmanageable at home. The number of boys protected in 1933 was 459.

The city has a few juvenile recreation grounds laid out in slum districts where children have no gardens and almost no opportunity to enjoy landscapes, flowers and trees.

Labour Exchanges There are 47 labour exchanges in the city. Condiions of their activity are as follows :

RESULTS OF THE ACTIVITIES OF THE MUNICIPAL LABOUR EXCHANGE OFFICES (1933)

	Number of jobs	Persons wanting jobs	Jobs secured
General employees	271,999	303,327	77,925
Juveniles	32,031	32,555	5,717
Salarymen	9,652	24,782	7,460
Day-labourers (working days)	3,133,611	4,884,463	3,099,884

Women's Workhouses There are 6 women's workhouses in the city, where domestic manual work is given to women of the lower middle class. This enterprise of the municipality was started in 1925 as a part of the capital reconstruction work. Less than 10 years have passed since its initiation, but the development which it has made deserves attention. In 1933 the number of working days of women was 185,769 and ¥91,878.14 was paid to them.

Unemployment Relief Works The city has been undertaking relief works for daily labourers since 1925, with good results. The works carried out in 1933 are roughly repairing of water works, sewers, streets and dredging of rivers and the harbour : total expenditure ¥15,075,584 ; total wages to labourers ¥4,888,215 for 2,774,583 working days.

Besides having labour exchanges for daily labourers, the city arranges to give jobs for the unemployed among the educated and lower salaried classes. In 1933 the amount expended for the work reached ¥1,070,915, of which ¥975,310 was paid for 768,047 working days.

Economic Protection In 1933 the city had 20 public pawnshops and loaned ¥1,199,093

In 1933 there were 16 municipal dining halls serving cheap nutrious meals, the number of meals served being 4,272,689.

The city established lodging-houses attached to labour exchanges in 1911.

In 1933 there were 14 such houses giving shelter to 3,024 labourers in daily average.

In addition to all these various

Digitized by Google

kinds of undertakings Tokyo municipality runs 3 public bath-houses, has a house exchange agency and controls House Building Associations.

The Tokyo Poor Asylum The Tokyo Asylum was founded in 1872. It takes care of the poor, those taken sick in the street, lost children and depraved boys. In connection with this work mention should be made of Viscount Shibusawa who devoted 60 years of his life to it as its director. The admission report shows that during 1933 men taken in numbered 77,459, leaving 2,398 in the asylum at the end of the year.

Administration and Government

History In July, 1868, the Emperor Meiji granted an Imperial message on the proposed removal of the capital to Tokyo. It was the beginning of the regeneration of Tokyo. At the same time the downfall of the Shogunate régime was announced and new Japan was born.

The Tokyo prefectural office was established soon after the issuing of the Imperial Rescript. In 1871, the city was divided into 6 large wards, but seven years later the large wards were abolished and 15 smaller wards established. In 1879, as the governor of the prefecture saw that these 15 wards were firmly established, he issued a decree concerning the formation and functions of ward assemblies, and thus instituted the first representative government system in this country.

Legislative Body To control municipal business the city has a city council and board of aldermen with a mayor as the head. Further, there are several departments, bureaux, sections, etc., for the execution of municipal affairs and office work.

Membership of the city council is an honorary position, the term of service being 4 years. The membership at present is 144, but owing to resignation of and death of members, the actual membership at the end of 1934 was 139. The principal functions of the council are the enactment and reorganization of city regulations, decisions as to finance, approval of settled accounts, imposition and collection of city taxes; and the right of proposing any bill, except the budget for annual revenue and expenditure. The board of aldermen of Tokyo once was the executive body, but in 1911 it became a legislative body. It is composed of 15 honorary aldermen to whom the mayor is added as chairman. The functional powers include the right of proposing any bill or expressing opinions on other matters.

Executive From 1889 till 1898 the function of the mayor of Tokyo was entrusted to the governor of Tokyo prefecture, but on October 1, 1898 the city became self-governing. The mayor is elected by the city council. Under the mayor there are three deputy mayors, a city counsellor, a treasurer, directors of departments, chiefs of bureaux, ward heads and other numerous offices. There are various kinds of committees as consultative bodies. The organization of the municipality is as follows:

THE DEPARTMENTAL ORGANIZATION OF THE TOKYO MUNICIPALITY

Sections	Functions
Private secretariat	Secret matters, keeping of seals, ceremonies and reward
Personnel	Personnel administration
General secretariat	General affairs, municipal research, elections, legal affairs, etc.
Bureaux	
Supervising	Supervision and inspection of municipal affairs

Digitized by Google

Bureaux	Functions
Finance	**Budget, loans, public land, taxation, purchasing, etc.**
Industrial	**Industry, promotion of industry and commerce, agriculture, fisheries and stock raising**
Education	**Management of schools; education, libraries, museums, etc.**
Social Work	**Protection and correction. Management of lodging houses, housing, labour exchanges, commercial training, etc.**
Public Health	**Management of hospitals, social hygiene, refuse disposal, parks and playgounds, auditoriums, cemeteries, zoological gardens, etc.**
Water Works	**Water supply and extension**
Public Works	**Roads, bridges, harbours and rivers, sewage disposal, buildings, etc.**
Electric	**Supply of light and power; electric cars, motor buses, subways, etc.**
Divisons	
Harbour	**Care of Tokyo harbour**
Municipal Office Building	**Building the City Hall at Tsukishima**
Miscellaneous	
Central Wholesale Market	**Wholesale of provisions**
Poor Asylum	**Protection of helpless persons aged or young**
Hygiene Laboratory	**Investigations on epidemics, bacteria, etc.**
Electric Laboratory	**Examination of meters and scientific research on electricity.**

Finance

When Tokyo became an independent self-governing city in 1898, its net annual expenditure was only ¥3,355,340, but this has grown to an estimated amount of ¥195,829,850 for the fiscal year 1934-5.

Expenditure and Revenue The estimated expenditure and revenue for 1934-5 are as follows:

EXPENDITURE

Category of account	Gross annual expenditure
Office expense	¥10,045,837
Education	25,045,584
Industries	737,716
Public health	8,193,247
Social work	7,588,150
Public work	33,421,973
Miscellaneous	4,177,449
Loan	62,151,976
Waterworks	14,582,100
Electric enterprises	29,935,818
Total	195,829,850

REVENUE

Items	Amount
Income from properties	¥2,757,206
Fees and charges	53,514,822
Government subsidy	16,491,248
Subsidy from Tokyo prefecture	1,656,123
Compensation	1,775,756
Sales of city property	2,510,767
Receipts from landowners	1,747,098
City tax	82,394,762
Loans and borrowing	52,621,100
Revenues from other sources	25,737,090
Total	191,205,972

City Property At the end of October, 1933, the property of the city of Tokyo was valued at ¥837,635,239, an increase of ¥23,371,839 as compared with the previous year.

Loans Loans of Tokyo City increased because of a great amount of loan floated due to the emergency of 1923, i. e. the great Kanto earthquake and fire, and the enlargement of the city in 1932. The total of loans which amounted to ¥193,158,000 rose to ¥745,627,945 on May 31, 1934; this means a burden of ¥647.82 per household in the city.

CHAPTER XXXIX

FIVE BIG CITIES

Osaka

General

Geographical Position The city of Osaka is situated nearly in the centre of Japan proper, near the eastern entrance of the Inland Sea with easy access to the Pacific Ocean, while on the other sides extend the fertile plains of the provinces of Settsu, Kawachi and Izumi. The city of Kyoto, the ancient capital of Japan, is situated 43 kilometres to the north-east, and the city of Kobé lies 32 kilometres to the west. The river Yodo runs through the city, and with the numerous canals that connect with it affords excellent transportation facilities by water. The Yodo rises in Lake Biwa, the largest fresh water lake in Japan, and branches off into the Shin Yodogawa, Okawa, Dojimagawa, Tosaborigawa, Ajikawa, Kizugawa and the Shirinashigawa, which in turn connect with numerous canals, the most famous being the Dotombori Canal.

Area The area of Osaka was 10 square kilometres in 1703; it was extended to 15 square kilometres in 1889, in which year it was made into a municipality; it was increased to 56 square kilometres in 1897, by the annexation of adjacent villages, and in April 1925, more annexations were made until today it covers 187.28 square kilometres. Osaka is the third greatest city in Japan so far as the area is concerned.

Population The population of Osaka on October 1, 1930, when the last national census was taken, was 2,453,573. The population over the same area in 1920 was 1,768,295 and in 1925 it was 2,114,804. The population on October 1, 1933, as estimated by the Cabinet Bureau of Statistics, was 2,654,000, of which 1,408,900 were men and 1,245,100 were women, the same on October 1, 1934 was 2,722,700, of which 1,445,000 were men and 1,277,700 were women. The number of households, in the same year, was 602,600 and the average number of a family was 4.5.

The density of population in 1934 was 14,538 to a square kilometre, and was the first in Japan in that respect.

In 1933 births registered were 77,498, that is 212 a day, still births totalled 5,093, and deaths 45,552, or 125 a day. The natural increase, therefore, was 31,946, or a decrease of 8,214 as compared with the previous year.

Of the births registered 39,913 were men, 37,585 were women, the rate of birth being 29.20 to a thousand of population.

Of the deaths registered, 24,070 were men and 21,482 were women. The rate of mortality was 17.16 to a thousand, an increase of 1.16 as compared with the previous year.

The causes of deaths registered during 1933 show that pneumonia and broncho-pneumonia were accountable for 12.0 per cent. of the total deaths, pulmonary tuberculosis 12.0 per cent. also.

The number of foreigners was 2,470, Chinese heading the list with 2,283 (92%).

Houses At the end of 1933 the number of dwelling houses was

Digitized by Google

542,062, of which 28,088 were vacant, that is, 5.18 houses to every 100, which is far larger than the ratio of 3 to 100, for other large towns in the country.

	Dwelling houses Vacant	Total	Percentage of vacant
1925	17,161	441,881	3.88
1926	19,139	459,938	4.16
1927	24,084	470,524	5.11
1928	24,760	484,446	5.11
1929	24,197	502,384	4.81
1930	26,963	509,874	5.28
1931	30,651	517,162	5.92
1932	28,655	529,637	5.41
1933	28,088	542,062	5.18

Industries

The city of Osaka holds an important position as a centre of industry as well as of commerce. At the end of 1933 the number of factories, excluding government concerns and small ones employing less than five workmen, was 8,200 which comprises 12 per cent. of the number of factories throughout the country. The total amount of production in the same year reached ¥1,039,651,000 (exclusive of gas and electric production), an increase of ¥284,130,000 (38%) as compared with the previous year. The following table shows the distribution of various industries.

Principal industries	No. of factories	No. of working men	Production in ¥1,000
Textile	1,082	38,878	206,182
Metallurgical	1,582	36,708	267,293
Machinery	1,662	38,718	150,359
Ceramics	282	10,623	34,392
Chemical	706	19,311	200,342
Milling and wood work	510	6,570	24,797
Printing and book binding	375	7,752	40,168
Foodstuffs	583	6,993	55,738
Gas and electric work	14	1,118	—
Miscellaneous	1,404	18,960	60,379
Total	8,200	185,626	1,039,651

At the end of 1932 the number of small factories employing less than five operatives was 25,329, the number of hired workmen was 25,803, the family of factory owners engaged in the works 31,388.

The increase in the number of hired ones and a decrease in that of family members as compared with the preceding years may be an indication of inflation reaching these petty family industries. The total amount of their production in 1932 was ¥54,460,000 or ¥2,200 per house.

Other Productions Productions of various industries other than factories in 1933 were as follows:

Agricultural	¥ 2,162,000
Livestock	4,661,000
Fisheries	2,996,000

Commerce

Business Companies At the end of 1933 the number of business companies in Osaka was 7,214, an increase of 386 as compared with the previous year. Their paid-up capital amounted to ¥2,440,830,000, increase of ¥24,000,000 as compared with the previous year.

Banks At the end of 1933 the number of banks in Osaka was 9 with 137 branches besides 93 branches of banks in other cities. Their deposits amounted to ¥1,953,000,000, loans to ¥1,721,000,000.

Warehouses In 1933 the 6 big warehouses in Osaka received commodities amounting to ¥510,769,000 and delivered ¥468,678,000, with ¥138,851,000 outstanding at the end of the year.

Exchanges There are four exchanges in Osaka—Osaka Stock Exchange, Dojima Rice Exchange, Osaka Sampin (raw cotton, cotton yarns and rayon yarn) Exchange and the Osaka Sugar Exchange. The three first mentioned are joint stock companies while the Sugar Exchange is organized on a membership system.

The turnover of the Osaka Stock Exchange during 1933 was 79,920,000

Digitized by Google

shares, which include both short and long term transactions, and the value of which reached ¥11,200,300,000 or an increase of 49 per cent. as compared with the previous year.

The Dojima Rice Exchange, which is the oldest established rice exchange in Japan dealt in 44,870,000 koku valued at ¥1,068,280,000. It was a decrease of 55 per cent. as compared with the previous year due to the effect of the enforcement of the Rice Control Law. Dealings in Sampin Exchange were 6,250,000 bales of cotton yarn, valued at ¥1,242,430,000, 2,360,000 bales of cotton, valued at ¥453,640,000, and 840,000 bales of rayon yarn, valued at ¥92,120,000. The Sugar Exchange transacted 4,680,000 sacks of sugar, amounting to ¥87,640,000.

Commodity Movements The total amount of commodities handled during 1933 reached 29,320,000 tons, of which 11,110,000 tons valued at ¥3,192,000,000 were sent out of the city and 18,210,000 tons valued at ¥2,765,000,000 were received in; i. e. in tonnage imports exceeded exports by 7,110,000 tons while in value exports exceeded imports by ¥428,000,000. This is a normal condition because imports mainly consist of cheap raw materials and exports include valuable manufactured goods.

The itemized table of the same follows:

OUTWARD AND INWARD SHIPMENTS

Kinds	Sent out		Receiving	
	Quantity (in 1,000 tons)	Value (in ¥1,000,000)	Quantity (in 1,000 tons)	Value (in ¥1,000,000)
Foodstuffs	849	148	2,386	355
Raw materials	2,713	246	9,584	455
,, ,, for manufacturing	2,310	442	3,155	575
Manufactured goods	5,171	2,354	2,871	1,357
Miscellaneous	68	3	218	22
Total	11,109	3,192	18,215	2,765

Central Wholesale Market The Osaka Central Wholesale Market handles under supervision of the city foodstuffs which are liable to deteriorate, such as fish, meat, eggs, vegetables and fruits. The amount handled during 1934 reached ¥63,011,000, an increase of ¥4,280,000 over the previous year.

Municipal Retail Markets The municipality of Osaka operates fifty-four retail markets which handle daily necessaries. The sales by these municipal markets during 1934 amounted to ¥23,320,000, a decrease of ¥60,000, as compared with the previous year. Owing to the decline of prices and buying capacity and increase of private markets, the value of necessaries handled by these markets shows a declining tendency every year.

Foreign Trade

The Osaka Customs Office handled, during 1934, 1,586,000 tons of goods valued at ¥586,180,000 for export and 4,221,000 tons valued at ¥523,290,000 for import, which shows an excess of imports over exports by 2,635,000 tons and an excess in value of exports over imports by ¥62,890,000. Compared with the previous year, it showed an increase of ¥122,650,000 or 26 per cent. in exports, and a gain of ¥81,600,000 or 18 per cent. in imports.

Digitized by Google

Transportation

Roads On March 31, 1934, the total length of roads in the city of Osaka was 2,477.664 km., and the total area occupied by these roads was 12,135 sq. km. or 6.5 per cent. of the total city area. According to the city planning, narrow roads are gradually disappearing. On the same date the concrete roads comprised 31 per cent. of the total area of roads just mentioned.

Rivers, Canals and Bridges Osaka is the Venice of Japan and owed its development much to the network of waterways. At the end of 1934, the total length of 12 main rivers and canals in the city was 54.735 km., and the number of bridges was 1,274.

Tramways and Bus Lines The first electric tramway in Osaka was built in September, 1903, between Hanazonobashi and the harbour, a distance of 4.828 kilometres. At the end of the same year it was decided that all electric railway lines within the city limits should be constructed and operated by the municipality. At the end of 1934 the length was 103.9 kilometres. In May, 1933 the underground railway opened its business between Umeda and Shinsaibashi, with the length of 3 km. In addition to the tramcar service the municipal authorities operate motor-bus lines. Private bus lines operate over certain districts of the city.

Suburban Electric Railways 9 private companies operate suburban electric lines—the Hanshin Electric Railway Company and the Hanshin Kyuko Electric Railway Company operate the service between Osaka and Kobé; the Kéihan Electric Railway Company line connects Osaka with Kyoto; the Osaka Electric, Sangu Kyuko and Osaka lines bring Nara and vicinity to within easy reach of Osaka; the Nankai and the Hanwa Electric Railway Companies operate between Osaka and Wakayama; and the Hankai Electric connects Osaka and Sakai. The total length of suburban electric lines reaches 874.4 kilometres. These electric lines, coupled with the railway lines operated by the Railway Ministry, make up the land transportation lines of Osaka.

Sea Transportation The Osaka harbour is one of the three largest ports in Japan and the number of steamships which entered the port in 1933 was 2,138, the aggregate tonnage of which amounting to 31,607,000 tons, while that of Japanese and foreign sailing vessels was 162,628 with 4,243,000 tons. Of the steamboats 12,089 were of the volume under 1,000 tons, 7,290 from 1,000 to 5,000 tons, and 1,659 above 5,000 tons.

Airways The Japan Air Transport Co., Ltd., operates a regular passenger and mail service with its airport at the mouth of the Kitsugawa. It takes 2.30 hours between Osaka and Tokyo, the distance being 425 kilometres. Fukuoka, Kyushu, may be reached in three hours, the distance being 500 kilometres. It is 1,684 kilometres to Dairen, via Fukuoka, Urusan, Seoul and Héijo. The planes leave and arrive twice a day both ways. The fare to Tokyo is ¥30 per passenger and that between Osaka and Fukuoka is ¥35. The number of passengers during 1934 was 4,120, and is annually increasing. The Japan Air Transport Institute operates similar service between Osaka and Matsuyama in Shikoku.

Municipal Industrial Research Laboratory The Osaka Municipal Industrial Research Laboratory was established in 1916, with an imperial bounty to cover part of the expenses, for the purpose of pursuing technical studies and giving guidance to manufacturers. The institution has since been

Digitized by Google

reconstructed and enlarged with an expenditure of some ¥500,000.

In 1925, the Institute for the Encouragement of Industry was established in the compounds of the Laboratory to ensure more competent activities. The new institute was built, at an expenditure of ¥200,000, in commemoration of the wedding of the Crown Prince. For the maintenance of these two institutes a sum of ¥150,000 is expended annually by the municipality. Besides taking the initiative in experimental work aiming at the improvement of production methods, they conduct scientific experiments at the request of private individuals and answer technical enquiries.

Education

In March, 1934, the number of kindergartens and schools in Osaka was 651, nurses, teachers and professors 12,256, and pupils and student totalled 423,708. As compared with the previous year the number of schools increased by 15, teaching forces by 533, and pupils and students by 23,429. Of the total number of kindergartens and schools the Government and prefectural numbered 29 (4.5 %), municipal 426 (65.4%).

Colleges and universities are Osaka School of Foreign Languages (governmental); Osaka Girls' College (perfectural); Osaka University of Commerce (municipal); Kwansai University (private); Naniwa Commercial College (private); Soai Girls' College (private); Otani Girls' College (private); Osaka High School (governmental); Osaka Imperial University (governmental). In 1933 the municipality paid ¥15,080,000, an annual sum of some ¥14,421,000 for the maintenance of educational institutions in the city.

Public Libraries There are one prefectural, six municipal and six private public libraries in Osaka. At the end of March, 1934 the number of books kept in these libraries was 321,845. During 1933, the number of persons visiting these libraries was 813,705.

Young Men's Training Institutes The number of training institutes for young men was 122 on April 1, 1934, the number of students being 17,258.

Temples and Shrines At the end of 1933 814 Buddhist temples, 812 sectarian Shinto preaching places, and 91 Christian churches constituted the religious force of the city.

Social Welfare Works

Relief of the Poor Since the issuance by the Government in 1874 of the relief regulation, the municipality of Osaka has given financial assistance to bodies engaging in the relief of the poor, the aged and deserted children. More recently it has undertaken the maintenance of diverse social welfare institutions aiming at the prevention of poverty. In 1933 three municipal maternity homes received 5,710 expectant mothers and took care of 9,570 such mothers. There are 60 institutions (municipal 18 and private 42) engaging in child protection, and there were 4,408 children staying at those institutions at the end of 1933.

The muncipality maintains 17 lodging-houses for the unemployed and labourers, while there are eight more similar establishments maintained privately.

The municipality also maintains dwelling houses, sells more by instalment payments and conducts public pawnshops. The last named loaned ¥471,628 during 1933.

Employment Exchanges The municipality maintains 13 employment exchanges, three of which deal exclusively with unskilled labourers, while another deals only with women. Besides numerous employment

Digitized by Google

agencies conducted as business enterprises there are 8 privately maintained employment exchanges.

These exchanges handled 213,504 cases for salary men and women and 20 per cent. of men and 24 per cent. of women got job. In day labour exchanges the number of cases reached 2,089,293 and 85 per cent. of which was successful.

Charitable Medical Institutions The municipality maintains 29 medical institutions where citizens of the lower classes may receive treatment, free of charge or with payment of the bare cost. There are 14 more such hospitals privately maintained.

City Planning

City planning was advocated as early as 1886 in Osaka, but nothing definite took shape until 1917 when the City Improvement Investigation Commission was organized to make investigations.

After many years of investigation, the city decided in April, 1922, to fix the area for the new city at 220 square kilometres, which includes the old city. The future city was to be divided into the dwelling district 33.3 per cent., the business district 11 per cent. and industrial district 30.2 per cent., leaving 25.5 per cent. for future division. Some of these districts were marked off as fire proof districts, where fire proof buildings alone were permitted to be constructed. Owing to the experiences gained by the great Kwanto earthquake of 1923, drastic changes were made in the above plan, which cost some ¥234,570,000.

In order to wash into the sea the polluted water in branch rivers and canals, the city intends to set up movable weirs.

Harbour Construction

Half a century ago the harbour facilities of Osaka were in such a poor condition that it was feared they would fail to keep pace with the rapid growth of trade. Osaka Bay, which lies to the west, was constantly subject to huge waves and exposed to high winds, and the mouths of the rivers were always choked with sand. In 1897, the municipality started construction work on a carefully worked out plan with a subsidy from the national treasury. By 1915, the greater part of the plan had been completed at an expenditure of ¥25,000,000, and thereafter the work was temporarily suspended owing to the financial difficulties of the municipality. Work was resumed in 1917. As part of the second plan of construction, the municipality started the construction of the pier and extension of the moorings in 1929. The work is expected to be completed in 1935.

The water area inside the breakwater is 6.55 square kilometres and the maximum depth within this area is 10 metres at mean low water. This depth enables the harbour to accommodate steamers of 10,000 tons without difficulty.

Waterworks and Sewerage

The first waterworks in Osaka were completed in October, 1895, at a cost of ¥2,390,000. Water was then drawn from the Yodo River at Sakuranomiya and was conveyed to a reservoir in Osaka castle for distribution to a population of 610,000. Reconstructions and expansions have since been made and today the Osaka Waterworks supply the citizens with a daily 383,000 cubic metres of water. In 1933, 500,000 houses used 116,688,000 cubic metres.

From 1894 on, several minor additions and reconstructions to the sewerage system of the city were attempted, but it was not until 1911 that anything really big was undertaken. Then from 1911 to 1927,

Digitized by Google

three big schemes, the last to be completed in 1935, at an aggregate cost of ¥17,000,000, have been put into effect.

Municipal Finance

In the fiscal year 1933-34 the revenue of the Osaka municipality was ¥140,757,000, expenditure ¥141,693,000. As compared with the finance of the city when she became an independent self-governing body in 1898 the amount of revenue is 44 times as large and that of expenditure 46 times. In 1933 city loan floatation amounted to ¥254,360,000, and the total amount of city loans on May 31, 1934 was ¥478,365,000 or ¥180 per capita of population.

Kyoto

Kyoto, known in antiquity by the name of "Heian" (the city of peace), was for about a thousand years the metropolis of Japan. At the Restoration, the Emperor Meiji moved his capital to Tokyo, but Kyoto retained its position as a cultural centre, and today it is looked upon as "the classic city" and the leader of culture in the western part of the country. The city, lying in what is called the Kyoto basin, is surrounded by many famous hills and mountains such as Arashiyama, Atagoyama, Kuramayama, Hiéizan and Higashiyama. The area of the city is about 289 square kilometres, the greatest length from N. to S. is a little over 26 kilometres and the greatest breadth is about 25 kilometres, the form being roughly rectangular. Osaka lies 43 kilometres to the south-west.

Boundaries The boundaries of the city have undergone considerable changes since 1888. At that date the first annexation of adjacent villages was made, a second extension was made in 1902 and a third in 1918. In 1929 three wards, Nakagyo-ku, Sakyo-ku, and Higashiyama-ku were newly added to the city. In 1931 the last annexation was made and two more wards, Ukyo-ku and Fushimi-ku, were constituted.

Population The population grew from 717,100 in 1927, to 736,000 in 1928, to 755,200 in 1929, and due to the above mentioned extensions in the boundaries, was found in 1930, to be 952,397. On October 1, 1934 the total number of population in Kyoto was estimated at 1,052,500, that of households was 224,129.

Industry and Commerce

In 1933 the conditions of factories which employed more than 5 persons in Kyoto were as follows:

	Factories	Operatives	Production (in yen)
Textile	784	15,390	34,675,341
Metallurgical	74	805	3,289,310
Machinery	104	1,876	2,410,854
Ceramics	53	670	1,457,834
Chemical	87	481	6,194,974
Saw milling & wood work	93	865	2,879,467
Printing & binding	57	753	2,176,968
Foodstuffs	283	3,891	21,506,747
Electric & gas	11	93	912,055
Miscellaneous	92	1,216	3,272,610
Total	1,588	25,540	78,775,160

TOTAL INDUSTRIAL PRODUCTION OF KYOTO

(1933)

Kind of Industry	Amount in yen
Agriculture	4,421,215
Livestock	3,959,744
Forestry	315,810
Mineral	135,302
Fisheries	53,200
Factories (including all petty shops)	224,828,928
Total	233,713,699
1932	208,592,249

Digitized by Google

Foreign Trade Not being a port Kyoto cannot carry on trade with foreign countries direct except by parcel post, but the goods consigned to and from foreign countries through other ports were (in ¥1,000),

	1930	1931	1932	1933
Exports	25,093	15,276	22,354	28,270
Imports	5,606	5,696	4,317	5,315

Banking Statistics Figures concerning the banks in the city are quoted below :

(in ¥1,000)

At the end of	No. of banks	Deposits	Loans
1930	83	427,875	154,428
1931	90	434,831	150,681
1932	88	453,702	156,344
1933	85	474,504	178,553

Commercial and Industrial Corporations At the end of 1933 there were 2,676 companies in Kyoto. Their paid-up capital amounted to ¥254,119,000. The clearing house turned over 19,522,580 bills with the value of ¥2,608,655,000 and delivered 2,140,360 bills with the value of ¥210,675,000.

Transportation

Vehicles At the end of 1933 the number of vehicles was 173,104, including 253 rikisha, 2,462 automobiles and 133,214 bicycles.

Municipal Tramways In 1933-34 the total length of the lines was 59.9 km., and carried 95,112,075 passengers, while the bus ran 37.5 km. of the lines and carried 9,901,396.

State Railways In 1933-34 the number of passengers who moved through Kyoto and other seven stations in the city was 17,137,570.

Suburban Electric Railways On the north the Eizan Electric Railway extends from Demachi Bridge to Kurama and Mount Hiéi ; on the northwest the Arashiyama line starts Shijoomiya and goes to Arashiyama and connects with the Atago Electric line. To the south Kyoto is connected with Osaka and Nara by three electric railways, i. e. Kei-han Electric, Shin (new) Keihan Electric and Nara Electric. The Kei-han line extends to the east from the terminal of Sanjō to the city of Otsu by Lake Biwa.

Rivers, Water-Power Works

Rivers Almost all the rivers that meet in the Kyoto Basin, rise in the Tamba tableland. The Hozu River, which later changes its name into the Katsura River, touches the western side of the city ; the Kamo River and the Takano River, rise in the southern part of the tableland, join together and flow across the city to empty into the Katsura River. The Uji River, starting from Lake Biwa, and the Katsura River meet in the southern suburbs of the city to form the Yodo River which flows southwestwards, through Osaka, into Osaka Bay.

Canal and Water-power Work The first Biwa Canal, completed in 1895 at the cost of ¥1,838,317, was designed for the conveyance of passengers and goods and for the supply of water power, while the second canal, completed lately at the cost of ¥4,477,805, supplies water for drinking, fire-brigades and for producing electricity, etc.

The waterworks were started in 1908 and completed in March, 1912, at the cost of ¥3,000,000 of which ¥750,000 came from the State treasury. The water is drawn from Lake Biwa by means of the second canal mentioned above and supplies water to 500,000 people. Further work, to cater to the needs of 200,000 people, is on the way. The supply in 1933-34 was 36,451,004 cubic metres to 143,044 households.

Education

Governmental and Prefectural : Kyoto Imperial University, the Third

Digitized by Google

Higher School, Kyoto Higher Industrial Schools, Kyoto Higher Sericultural School, Kyoto Sangyo Koshujo (School of Sericulture).

Municipal schools: Kyoto Painting School.

Private schools: Ritsumeikan University, Doshisha University, Ryukoku University, Otani University, Shingon-shu University, Buddhist School, Military Arts School.

NUMBER OF EDUCATIONAL INSTITUTES
(March 1, 1934)

	No.	Instructors	Students
Kindergartens	50	163	4,069
Elementary schools	135	2,735	119,839
Business continuation schools	41	259	2,729
Blind, deaf and dumb schools	2	46	343
Girls' high schools	17	469	9,721
Middle schools	15	403	7,465
Technical schools	10	356	7,166
Normal schools	2	96	1,054
High school	1	66	876
Colleges	15	655	5,783
Universities	7	850	10,356
Total	295	6,098	169,401

Libraries and Museums There are also in Kyoto other institutions for educational purposes as the Imperial Gift Museum, Kyoto Municipal Library, Kyoto Fine Arts Museum, etc. The libraries of the Kyoto Imperial University, of the Cabinet and of the Imperial Household Department are especially deserving of mention.

Shrines and Temples In 1933 the numbers of Buddhist temples and Shinto shrines with which Kyoto is famous were 403 shrines, 300 preaching places of sectarian Shinto sects, 1,417 Buddist temples, while Christian churches numbered 52.

Social Work

Conditions of social undertakings under municipal management in 1933-34 were:

	No. of establishments			
Public markets	11		Sales account	¥2,268,806
Housing	5	Places		249
Public baths	4	houses	Bather	(in 1932) 1,024,214
Labour exchanges	8		Cases	46,821
			Employed	12,391
Lodging houses	2		Lodgers	11,391
Lunch-rooms	2		Meals	(in 1932) 156,867

Finance

The annual revenue and expenditure, both general and special, of Kyoto amounted to:

Fiscal year	Revenue (in ¥1,000)	Expenditure
1931-32	40,548	40,444
1932-33	37,517	37,002
1933-34	26,083	36,302
1934-35	27,453	37,884

Municipal debts outstanding on May 1, 1934 totalled ¥38,436,638 or ¥37.429 per capita of population.

Nagoya

Nagoya is situated in the very centre of the main island. Facing Isé Bay on the south and bordered by the fertile plain of No-Bi on the north, the climate is always mild. Nagoya castle, with its famous golden dolphins, speaks of the glorious history of the city, but one cannot live on the past, and old and historically important as the city may

Digitized by Google

be, she fills today a more important rôle than that of an antique, for she is a distributing and industrial centre for the middle part of Honshu, a rôle that will grow in importance as time goes on.

Area and Population

The increases of population and area during the ten years 1924-33 are shown in the following table:

On October 1	Population	No. of Households	Area (sq. km.)
1924	670,800	142,723	148.142
1925 (census)	768,558	161,141	148.142
1926	801,900	168,466	148.142
1927	835,700	175,567	148.929
1928	869,900	182,752	148.929
1929	904,700	190,063	148.929
1930 (census)	907,404	190,379	150.738
1931	934,400	198,000	151.044
1932	961,800	203,700	151.044
1933	989,600	209,700	151.044

Buildings Number of buildings in 1933 was as follows:

Stone, brick, etc. buildings	26,962
Wooden buildings	248,784
Total	275,746

Commerce and Industry

Companies and Banks At the end of 1933 the number of business corporations in Nagoya was 3,775, and that of banks 7 with 59 branches besides 23 branches of banks in other cities. At the end of 1933 deposits amounted to ¥416,163,639, outstanding loans to ¥191,504,311.

Warehouses The receipts of goods by the warehouses owned by three big warehouse companies in 1933 amounted to ¥114,779,511, delivery to ¥108,958,232, leaving the outstanding stock valued at ¥27,276,645 at the end of the year.

Domestic and Foreign Trade Foreign and home trade values in recent three years were as follows:

	EXPORTS	IMPORTS
Home trade	(in yen)	
1931	84,928,640	88,120,608
1932	86,010,396	101,770,517
1933	41,596,840	122,252,842
Foreign trade		
1931	37,910,564	64,999,153
1932	64,458,989	69,553,389
1933	89,420,348	91,178,124
Totals of home and foreign trades	(in yen)	
1931	72,839,204	153,119,761
1932	100,469,385	171,323,906
1933	131,017,188	213,430,966

In 1933, in home trade, shipments of rice, other cereals, confectioneries, cotton tissues, iron, timber, wooden board and boxes, knitted goods, ceramics and fertilizers exceeded million yen each, ceramics heading the list with ¥4,019,953; receipts of rice amounted to ¥12,733,647, sugar ¥20,993,963, lumber ¥16,173,290 and coal ¥18,587,539. In foreign trade, exports of wheat flour amounted to ¥2,309,856, beer ¥2,149,435, cotton tissues ¥34,248,139, ceramics ¥30,076,760, glass and glasswares ¥1,080,169, iron manufactures ¥1,867,775, boards for boxes and casks ¥2,245,157, and veneer boards and other planks ¥1,043,671; imports of wheat amounted to ¥4,104,925, wool ¥40,549,273, cotton ¥4,533,382, timber ¥4,750,668, coal ¥4,150,501, fodder 3,661,787 and bean cake ¥3,171,754.

Exchanges Nagoya has three exchanges, i. e. the Stock Exchange, Rice Exchange and Cotton Yarn Exchange. In 1933, the turnover of the Stock Exchange was 247,831 shares long term transaction valued

Digitized by Google

at ¥18,079,199, 26,828,770 shares short term valued at ¥3,571,054,709. The Rice Exchange handled 5,895,800 koku while the Cotton Yarn Exchange handled 1,594,790 bales.

There are in Nagoya 11 wholesale markets, and 14 municipal and 93 private retail markets. In 1933 the 11 wholesale markets sold commodities valued at ¥25,271,361, and 107 retail markets ¥8,234,166.

Industry Commodities that are brought into the city are foodstuffs and raw materials such as rice, sugar, timber, coal, ginned cotton, iron, wool, etc., while those sent out are mainly lumber, coal, cotton piecegoods, porcelain and pottery, beer, cement and other manufactures. Nagoya has been from olden times a famous place for porcelain and pottery and in 1933 the output totalled as much as ¥17,026,689. It is only since the growth of the cotton spinning industry in the city that the value of the annual output of pottery has been challenged. The total production of the cotton spinning industry reached ¥147,488,588 in 1933. An equally significant development is that of the machine and machinery. In 1933 the total output of machine industry reached ¥62,747,161.

Number of Factories and Production Number of factories employing more than 5 operatives and productions of various industries in 1933 follow:

Kind of industries	Factories		Operatives		Output (in ¥1,000)	
	1932	1933	1932	1933	1932	1933
Textile	520	517	29,537	29,696	115,341	147,488
Metallic	197	235	2,963	3,569	6,176	10,205
Mechanical	464	575	20,277	25,553	48,575	62,747
Pottery and porcelain	124	136	7,376	9,498	11,650	17,026
Chemical	102	123	2,553	3,464	9,967	14,402
Saw mills and wood works	316	354	5,258	5,708	13,406	17,871
Printing and bookbinding	126	131	2,308	2,457	7,280	7,899
Comestibles and beverages	216	226	3,171	3,184	30,382	35,221
Gas and electric	2	3	205	234	5,478	5,486
Others	487	460	3,788	4,090	9,111	13,370
Total	2,554	2,760	77,436	87,453	252,868	331,719

Transportation

Railways Lying as it does between Kyoto, the old capital, and Tokyo, the present capital, Nagoya is known as Chukyo (middle capital). It is an important intermediate city on the Tokaido highway. The Kwansai line, which starts from Osaka, passes through Nara and Miyé prefectures and connects at Nagoya with the main Tokaido line to Tokyo. The Chuo line, which runs through Gifu, Nagano, Yamanashi and other prefectures to Tokyo, has Nagoya as its other terminus. Nagoya is thus one of the most important railway centres of Japan. The railway station and the harbour are directly connected by rail and the importance of the city as a distributor of goods is thereby enhanced. There are 8 stations, viz., Nagoya, Nagoya Minato, Atsuta, Chikusa, Ozoné, Hatta, Shiratori, and Horikawaguchi. The annual passenger traffic passing through these 8 stations is estimated at about fifteen million persons, and goods traffic amounts to approximately three million tons. The city is provided with an extensive network of electric railway lines to connect with outlying districts. The principal ones are:

Digitized by Google

(1) Mei-Gi Railway extends to Gifu, Ichinomiya, Inuyama and Tsushima.

(2) Seto Electric Railway runs to Seto.

(3) Aichi Electric Railway to Toyohashi and Tokonamé.

(4) Shimonoishiki Electric Railway to Shimonoishiki.

In 1933 the total length of roads in Nagoya extended to 2,848 kilometres, the number of bridges 473, that of vehicles 179,244

Harbour Works Nagoya has a splendid harbour well protected by Chita Peninsula from typhoons. Construction of the harbour was started in 1896 and the third stage of the entire plan was completed in 1928 after a total outlay of ¥15,490,000. The area of the wharves is 1.52 square kilometres, with anchoring space for thirty-eight steamers of ten thousand tons or so. The fourth stage of construction was undertaken at an estimated expenditure of ¥10,120,000. When the work is finished the area of the wharves will be increased to 2.23 square kilometres and there will be anchoring space for fifty-two steamers of ten thousand tons. At present direct trade is carried on with the American continent, Europe, China, the South Sea Islands, Australia and Africa.

Education and Social Work

Social Work Social undertakings in 1933-34, were as follows :

	Establishments	Beneficiaries
Maternity hospitals	5	208
Municipal houses to let	269	227 households
Public lodging houses	4	182,644
Public pawnshops	4	(Loan ¥162,511 to 37,380 persons)
Intelligence offices	4	20,333
Labour exchanges	3	637,201
Hospitals : Ordinary	1	481,817
Special	2	2,966
Establishments for free medical treatments	4	128,546
Municipal "Tozanryo" for poor relief	1	757
Municipal retail markets	14	sold ¥2,678,492

Educational Facilities In March, 1933 the number of schools and pupils in Nagoya was 248 and 171,389 respectively classified as follows : 34 kindergartens with 3,135 children; 104 elementary schools with 135,958 pupils ; 63 secondary schools with 25,359 pupils ; 9 collegiate schools with 3,311 students, 2 blind and deaf-mute schools with 289 pupils ; and 36 miscellaneous schools with 3,337 students.

Among the above mentioned schools those belonging to the municipality were :

Kind of schools	No.	Classes	Instructors	Pupils
Elementary schools	99	2,411	2,675	134,277
Girls' high schools	3	—	85	2,624
Commercial schools	3	—	101	2,512
Technical school	1	—	29	433
Business continuation schools	29	—	395	8,397
Kindergartens	4	22	24	577

Finance

Revenue and Expenditure The annual revenue and expenditure of Nagoya city has shown a marked increase of late as it is clear by the following table :

Digitized by Google

Year	Revenue	Expenditure		
		Ordinary	Extraordinary	Total
1926-27	¥10,131,031	¥5,996,229	¥4,064,042	¥10,079,271
1927-28	10,415,166	6,566,182	3,788,203	10,354,385
1928-29	19,438,161	7,275,835	11,663,553	18,939,388
1929-30	25,390,085	7,034,796	18,219,390	25,254,186
1930-31	31,477,355	6,878,659	23,545,976	30,424,635
1931-32	37,963,011	7,126,598	28,946,961	36,073,559
1932-33	45,421,218	7,163,058	36,644,010	43,807,068
1933-34	84,689,082	7,578,021	76,511,764	84,089,785

Municipal Loans At the end of March, 1933, the total indebtedness of Nagoya city amounted to ¥83,602,977 or ¥84 per capita of population.

Yokohama

General

History Yokohama, in the Bunroku Era, about 1587, was a hamlet of twelve families and by the time it became an open port, July 1, 1859, it was only a small fishing village of one hundred families or 350 people. The real growth began with the arrival of the foreigners. The commercial treaties Japan entered into with the United States of America, the Netherlands, Russia, Great Britain, and France stipulated that Kanagawa should be an open port, because it stood on the open harbour nearest Tokyo, then known as Yedo and the seat of the Shogunate Government, but as that village was already very crowded the Tokugawa Shogunate opened up the village of Yokohama instead.

In the beginning four streets were laid out, but as more and more Western, Chinese and Japanese merchants gathered there the area was quickly extended. The population in 1877 was 30,000, five years later it had grown to 52,000, and five years after that there were more than 94,000 in the town. At the end of September, 1932, the population was 661,500. Yokohama received the status of a municipality on April 1, 1889. In 1901, the once thriving port of Kanagawa and other adjoining villages and towns were absorbed by the newly risen Yokohama, and in 1911 and 1927, further extensions took place.

Quake and Rehabilitation Yokohama and suburbs suffered severely in the great earthquake and fire which occurred on September 1, 1923. Practically the whole town was reduced to ruins and ashes, but with the untiring efforts of its citizens, together with generous support from outside, the reconstruction of the town was completed, as originally planned, within six years of the disaster. On April 22, 1929, His Majesty the Emperor honoured the city with a visit of inspection, and the following day the municipality celebrated the completion of its programme of reconstruction which, in truth, was the creation of a new city out of a pile of cinders.

On April 1, 1927, two adjoining towns and seven villages, with a population of 115,757, were annexed to the municipality, and on October 1 of the same year the whole city was re-divided into five wards; Tsurumi, Kanagawa, Naka, Hodogaya and Isogo. By that time the construction of the gigantic breakwaters, the reclamation at Namamugi and Koyasu and the extension

Digitized by Google

of the waterworks was completed, and the perpetual land leases were being bought back by the municipality one after another.

Location Yokohama is situated in the south-eastern part of Honshu, the main island of Japan, on the western shore of the Bay of Tokyo about 22 miles from the entrance to the bay, in latitude 35° 27′ N., longitude 139° 38′ E. It is the seat of government of Kanagawa prefecture, of which it is also the largest population centre. It is surrounded by hills on which the better class residential districts are located.

Climate Yokohama's location on the Bay of Tokyo serves to modify the heat of summer, the nights being generally cool and comfortable. In the summer months there is an absence of rainfall. Rain is most abundant in June and September, the two rainy seasons of the year, at which times the humidity is trying, but never so bad that the climate is unbearable. In winter the sky is clear and the atmosphere crisp and invigorating. In February there is a short season of damp cold during which there are occasional snowfalls. From March spring begins, with bright sunny days and frequent strong winds. During the summer months typhoons are to be expected, but Yokohama harbour is protected from their violence.

Area and Population At the end of 1934 the area of Yokohama was 133.875 square kilometres. The total number of population in October, 1934, was estimated at 703,900.

INCREASE OF POPULATION OF YOKOHAMA

1930—1934

October 1 of	Men	Women	Total	Households
1930 (census)	317,084	297,624	614,708	134,320
1931 (estimate)	331,300	309,500	640,800	140,338
1932 („)	341,500	320,200	661,500	144,923
1933 („)	351,500	331,100	682,600	149,531
1934 („)	361,700	342,200	703,900	154,181

Foreign Residents The number of foreigners residing in Yokohama at the end of December, 1922, was 7,492. This figure was greatly reduced in consequence of the great earthquake and fire of September, 1923, in which all the foreign consulates were reduced to ashes and many of their staffs lost their lives. The number of foreigners at one time decreased to 376, but they gradually returned and by the end of December, 1933, the number had grown to 4,000.

The following table shows the nationalities of foreigners according to sex at the end of 1934:

FOREIGN RESIDENTS IN YOKOHAMA

(1934)

	No. of houses	Men	Women	Total
British	257	298	293	591
American	140	179	133	312
German	85	103	78	181
French	40	52	51	103
Italian	12	11	17	28
Swiss	28	37	25	62
Chinese	809	1,967	1,069	3,036
Others	177	225	176	401
Total	1,548	2,872	1,842	4,714

Commerce

Exchanges During the one year from December, 1933, to November, 1934, sales of the Yokohama Raw Silk Exchange amounted to ¥258,994,806 while deliveries amounted to ¥5,266,300. Sales of the Yoko-

Digitized by Google

hama Stock Exchange amounted to ¥20,426,608 and deliveries, ¥1,979,090.

At the end of 1934 the stock in warehouses amounted to ¥139,683,902, gaining ¥15,000,000 over the previous year.

Banks At the end of 1933 the number of banks and branches was 50, i. e. 6 banks, 19 branches thereof, and 25 branches of banks in other cities. Their paid-up capital amounted to ¥108,547,500; deposits ¥360,091,000; advances and loans ¥219,277,000.

Companies At the end of 1934 the number of business companies was 374 with the paid-up capital of ¥301,045,000.

Warehouses At the end of 1934 the stock in the warehouses in Yokohama amounted to ¥139,683,902.

Foreign Trade In 1934 exports from Yokohama amounted to ¥490,201,000 and imports to ¥537,316,000, and for the first time in recent years imports exceeded exports as it is shown below.

FOREIGN TRADE THROUGH YOKOHAMA

(in ¥1,000)

	Exports	Imports	Total	Excess of

Wood works	488	2,409	5,111,024
Printing and bookbinding	117	741	1,698,047
Comestibles	1,829	5,718	60,709,453
Gas and electric	4	378	11,144,054
Miscellaneous	901	3,714	6,378,788
Total	4,572	39,552	242,737,379
1932	4,240	33,906	169,745,432
1931	4,489	30,973	170,880,870
1930	4,730	29,809	189,102,463
1929	5,903	40,066	206,438,349

Note: The table includes smaller factories which have operatives less than 5.

Transportation

Ships Entered Yokohama The total tonnage of vessels which entered the port of Yokohama in 1933 reached 18,585,967 tons. Details follow:

SHIPS ENTERED YOKOHAMA

(1930—1933)

	Japanese		Foreign		Total
	No.	Tonnage	No.	Tonnage	Tonnage
1933	67,967	13,879,378	883	4,706,589	18,585,967
1932	58,506	12,904,753	824	4,565,959	17,470,712
1931	65,800	12,905,944	919	4,804,401	17,710,245
1930	73,962	12,803,753	961	4,854,489	17,658,242

Railway Passengers In 1933 the Government railway passenger who left and arrived at Yokohama, Sakuragicho, Tsurumi, Higashi-kanagawa and Hodogaya stations numbered 38,651,363.

Electric Tramways Tramways were first installed in July, 1904, by a private company and later were purchased by the municipality. There are now over 50 kilometres of lines and carried 39,589,471 persons in 1933. There are three private tramway companies attending to the suburban services, viz., the Kei-hin Electric Tramway, the Tokyo-Yokohama Electric Ry., and the Jinchu Electric Ry. The number of passengers of these private tramways for 1933 was 15,482,871.

Miscellaneous In 1934 the length of roads in Yokohama was 2,066.769 km. and the number of bridges 529.

In March, 1934, the total number of vehicles was 92,920, of which automobiles numbered 1,359 while bicycles totalled 73,062.

Education

Schools and Colleges On March 1, 1934, there were 70 elementary schools, of which 66 were maintained

Digitized by Google

by the municipality. The number of children at these schools was 94,133.

There were 21 kindergartens with 841 children.

The number of middle grade, higher, and special schools and their pupils follows :

	No.	Students or pupils
Middle schools	6	3,972
Girls' high schools	12	6,103
Technical schools	9	4,106
Business continuation schools	36	4,467
Blind, deaf and mute schools	3	241
Colleges :		
Governmental	2	986
Municipal	1	298
Private	2	1,246
Total	5	2,530
Prefectural normal School	1	244

Young Men's Training Institutes The number of these institutes follows :

Municipal	30	3,372
Private	2	90

Libraries In 1933-34 the library statistics were as follows :

	No.	Books	Visitors
Prefectural	1	9,774	2,712
Municipal	1	36,254	235,309
Private	1	16,686	6,758
Total	3	62,714	244,779

Religion In 1933 the number of Shinto shrines was 151, Buddhist temples 199, and Christian churches 30.

Social Works In 1933 the conditions of social works in Yokohama were as follows :

	Establishments		Beneficiaries
Child protection	5		815
Employment exchanges	8	cases	691,278
		employed	662,450
Lunch halls	3		28,719
Pawnshops	21	Loans	¥ 642,638
Housing houses	2,055	households	1,619
Lodging house	1		19,031
Poof relief			2,416

Finance

Revenue and Expenditure The ordinary revenue and expenditure of the city of Yokohama in 1929 to 1933, amounted respectively to :

1930—1931	¥16,671,428
1931—1932	15,182,861
1932—1933	16,540,066
1933—1934 (estimate)	15,260,789
1934—1935 („)	14,179,844

In 1934-35 budget of Yokohama the total amount of ordinary and special expenditures was estimated at ¥26,392,406. Itemized details follow :

Items	Amount in yen	Percentage
Municipal office	939,184	3.65
Education	2,811,327	10.65
Industriy	144,636	0.55
Hygiene	1,118,390	4.24
Social works	1,135,539	4.30
Public works	1,010,679	3.83
Loans	12,418,869	47.05
Miscellaneous	1,048,431	3.97
Water works	2,216,880	8.40
Gas	1,048,143	3.97
Electricity	2,500,328	9.47
Total	26,392,406	100.00

Bonded Indebtedness At the end of March, 1934, the total bonded indebtedness of Yokohama city amounted to ¥158,570,246.

Kobé

General

Geographical Position and Area The city of Kobé lies on the south-west coast of Hyogo prefecture in the Kansai district of Honshu, situated at 135° 5′–15′ E. long. and 34° 38′–45′ N. lat. The greatest length from west to east is 14.47 kilometres and the greatest breadth from north to south is 13.5 kilometres, the total area being 83.06 square kilometres, of which about 60 per cent. is occupied by mountains and hills, and the rest by farms and the city proper. The form of the city is like a long

Digitized by Google

band, and is divided into eight wards known at Nada, Fukiai, Kobé, Hyogo, Soto, Minato, Hayashida, and Suma.

Climate The city of Kobé has an exhilarating climate at all seasons of the year on account of the advantage of its geographical position. It is backed by the Rokko mountain-chain and faces the Chinu Sea in Osaka Bay. The average temperature is 15° C (59° F). During summer the temperature sometimes runs up to 37° 6′ C (99.6° F), but the average temperature of August and September is 26° 2′ C (79.2° F). In winter the thermometer sometimes ranges about 5° 8′ C below zero (21.5° F), but snow is rarely seen. The highest temperature in 1932 was registered as 37.6 C (98°6′ F), and the lowest temperature 3.1 below zero (26°4′ F) the average of the year being 15°C (59° F). The precipitation in the same year was 1,497 mm.

Population The following are the results of the national census for the year 1930:

Families	178,325
Population	787,616
Males	406,348
Females	381,268

As compared with the results of the general census taken in 1925, the population has increased 143,404 (18.2%), and the families 26,820 (14.4%) during the interval of five years. The increase was mostly made up by the annexation of three adjacent villages on the eastern part of the city. The average number of members per family were 4.42, and the percentage of sexes was 100 females to 106.6 males. The estimated families and population on October 1, 1933 were as follows:

Families	193,740
Population	853,800
Males	438,100
Females	415,700
Per family	4.4

Foreign Residents According to the statistics taken by the police office of Kobé, at the end of 1933, the total number of foreign residents in Kobé was 5,711.

Houses With the exception of public and municipal buildings and the houses of foreign residents, the total number of houses in the city was registered as 86,615 at the end of 1927, among which one-storied houses numbered 44,473, two-storied ones 41,185, and three-storied ones 957. There were 84,507 buildings of wood, 98 per cent. of the total number; of brick 1,651; of concrete 402; and of stone 11.

Waterworks The waterworks were at first designed in 1909 to supply 3 cu. ft. per capita a day to 250,000 inhabitants, but the plan was later altered to provide for 100,000 families, 25 cu. ft. a day. The work lasted until 1923 and cost ¥12,858,720, of which state grants amounted to ¥3,403,000. In 1926, the municipality increased its water supply by laying pipes in the eastern suburbs to draw water from the Chikari pond behind Mt. Rokko. In 1932 the city supplied 36,113,679 cubic metres to 147,787 households and other uses.

Police Stations The total number of police stations in the city at the end of 1932 was 9. Police boxes numbered 181, and policemen 1,810.

Commerce and Industry

Movement of Commodities The movement of commodities through the Kobé harbour and railway stations in 1932 within Japan proper and Chosen was as follows:

	Tonnage (in 1,000 tons)	Value (in yen) Japan proper	Chosen
Outgoing	4,198	357,077,942	20,136,409
Incoming	7,672	296,007,300	30,134,564
Total	11,870	653,085,242	50,270,973

Foreign Trade The grand total of exports and imports in 1933 was

Digitized by Google

¥1,291,661,000, showing an excess of ¥9,418,000 of exports over imports.

EXPORTS AND IMPORTS OF KOBÉ IN 1929-1933

(in 1,000 yen)

Warehousing At the end of 1933 number of principal warehouse companies in Kobé was 8 and the area covered by the warehouses was 137,706 tsubo. In 1933, goods received by these warehouses were valued at ¥617,400,000, while ¥588,941,000 worth of goods were delivered. Goods stored at the year end were ¥143,309,000 which showed a gain of ¥28,803,000 over the previous year.

Electricity and Gas At the end of 1933 the number of electric lamps in the city was 823,393 and electric motors 6,275. In the same year the municipality which undertakes the electric business got ¥10,838,373 from it.

In 1933, gas was supplied to 96,970 families with 244,971 spouts.

Banks and Business Firms At the end of 1933 the total number of banks and branches was 68, i.e. 3

Digitized by Google

banks, 15 branches thereof, and 50 branches of banks in other cities including 7 branches of savings banks. The deposits of ordinary banks and branches amounted to ¥5,334,753,000 and advances and loans ¥3,511,112,000.

In 1932 the clearing house turned over 2,412,043 bills with the value of ¥3,520,509,000, gaining over the previous year 30,009 bills and ¥337,698,000 respectively.

At the end of 1933 the number of companies was 2,833 with the paid-up capital amounting to ¥602,743,000.

Factories and their Workers At the end of 1933 there were 858 factories. The total number of the staff was 4,914, that of workers 48,227, and the total production was valued at ¥245,292,369.

Transportation

Roads At the end of 1933 the total length of roads in the city reached 685.8 km. gaining 7.2 km. as compared with the previous year.

Sea Transportation In 1933 the number of ships entered the Kobé harbour was 25,687 with 44,093,884 gross tons, of which registered tonnage was 25,665,703 tons.

Of the total number 21,734 were vessels sailing home waters and 3,953 on international courses. The foreign vessels numbered 1,057, Great Britain heading the list with 490 (2,743,042 tons), followed by the U.S.A. with 216 (1,469,602 tons).

VESSELS ENTERED KOBÉ

1930–1933

	Number of vessels	Registered tonnage
1930	23,891	24,915,302
1931	24,300	24,967,356
1932	24,804	24,975,154
1933	25,687	25,665,703

Vehicles On March 31, 1934, the total number of vehicles of various kinds was 87,898. The itemized table follows:

March 31 of	Rikisha	Carts	Automobiles	Autocycles	Bicycles
1931	1,046	15,336	1,549	684	65,379
1932	801	12,527	1,549	771	68,847
1933	654	12,151	1,584	862	71,609
1934	489	10,792	1,598	989	74,030

Railways In 1932 the total number of passengers who left from and arrived at 9 stations in Kobé was 21,070,516.

Electric Tramways The tramways within the city limits are operated by the municipality, the total open mileage being 30.798 km. at the end of 1932. Attending to the suburban service, there are private companies, the Sanyo Electric Tramway (Hyogo-Himeji), Han-Shin Electric Ry., (Kobé-Osaka), Han-Shin Express Electric Ry., (Kobé–Osaka), and the Shin-Yu Electric Railway (Kobé–Arima). Han-shin Kokudo Ry. was laid along the national road between Osaka and Kobé in 1927 and opened business in 1932, forming a parallel line to the state railway.

Education, Religion and Social Works

Schools In 1933-34 the number of elementary schools was 75, including 67 municipal schools, with 2,430 teachers and 105,554 pupils. Middle schools numbered 5, of which 3 were prefectural schools and 2 were private schools, with 176 teachers and 4,599 boys. The number of girls' high schools was 10, and pupils 7,491.

Digitized by Google

The number of business schools was 27, of which 9 were commercial, 3 were technical, 4 were business and 11 were business continuation. The total number of teachers was 633 and students 15,165. There is a government university of commerce and a technical college. In 1932-33 Kobé expended ¥4,678,373 for educational purposes.

Shrines, Temples and Churches At the end of 1933 there were 100 Shinto shrines, 152 Buddhist temples, 397 Tenrikyo and Shinto churches, 254 Buddhist halls, and 55 Christian churches.

Social Welfare Work At the end of 1933 municipal establishments for social welfare work were as follows :

Markets, 12 ; cheap eating-houses, 6 ; employment exchanges, 6 ; public nurseries, 2 ; lodging-houses, 5 ; boys' consultation offices, 1 ; municipal dwelling-houses, 3 places ; municipal pawnshops, 1 ; relief house, 1 ; peoples' hospitals, 4 ; sanatorium, 1.

Finance

In 1932-33 Kobé received ¥40,362,920 and expended ¥41,566,316. The ways and means of the municipality for past 5 years follow :

	Revenue	Expenditure
1930-31	¥44,818,597	¥44,991,844
1931-32	39,993,340	46,897,568
1932-33	40,362,920	41,566,316
1933-34 (estimate)	38,851,816	40,480,196
1934-35 (estimate)	49,306,906	50,161,680

The total amount of the city loans standing at the end of March, 1935, was ¥108,915,623. The loans and the sum borrowed in cash in the fiscal year 1934-35 was ¥113,041,600 while the sum refunded was ¥4,125,977.

CHAPTER XL

CHOSEN (KOREA)

General Description

Chosen, a peninsula extending southward from the north-eastern side of the continent of Asia, is washed on its eastern and western coasts by the Sea of Japan and the Yellow Sea respectively, and borders Manchoukuo and the Maritime Province of Siberia on the north, from which it is separated by the two rivers, the Yalu or Oryokko and the Tumen. Between the upper waters of these two rivers there is a mountain range which separates and turns them in opposite directions, the former flowing through Antung into the Yellow Sea. On the south the peninsula faces the Island of Kyushu and the western coast of Honshu, across the Korean Straits, with the islands of Tsushima and Iki about midway. It lies between the parallels of 33° 06′ and 43° north and 124° 11′ and 130° 56′ east, having a total area of 220,740.72 square kilometres which is about one-third of the area of the whole empire.

Surrounded thus by sea on three sides, Chosen has a long coast line extending in all to 8,674 kilometres. It has many good harbours on the south and west coasts, such as Fusan, Reisui, Mokpo, Jinsen and Chinnampo. The tides rise far higher on the west coast than on the east, the difference between the highest and the lowest tide-mark on the former reaching over ten metres, while on the east coast near Gensan it is less than half a metre. The country is as a whole mountainous, the eastern side steep and rocky, but sloping down more gently on the western side toward fertile plains traversed by large rivers such as the Daido, Kan, Kin and Rakuto. The northern half of the peninsula is comparatively level and fit for agricultural work, whilst the southern half is rich in timber and minerals indicating good possibilities for future industrial development. The climate in Chosen is continental running to extremities of both heat and cold, the spring and autumn seasons being very short though highly delightful. One needs hardly add that the climate is decidedly rigorous in the north and milder in the south. Moreover, the eastern coast has on the whole a milder climate than the western, the average temperature being some 2° C. higher, except in the middle of summer.

Population

According to the report of the Ministry of Overseas Affairs, the population of Chosen in 1933 was as follows :

POPULATION OF CHOSEN (Dec. 31, 1933)

Province	Japanese	Koreans	Foreign (incl. Chinese)	Total	Density per sq. km.
Keiki	138,012	2,024,387	8,736	2,171,135	169.4
North Chusei	8,036	866,734	536	875,306	117.7
South Chusei	24,477	1,365,815	1,392	1,391,684	171.8
North Zenra	33,619	1,415,814	1,709	1,451,142	169.5
South Zenra	41,156	2,240,982	1,067	2,283,205	164.3

Keijo (Seoul), the old capital of Korea and now the seat of the Government-General, had at the end of 1933 a population of 382,491, of which the Japanese numbered 106,782 and the others 5,119.

The following is the classification of the population of Chosen according to occupation :

POPULATION ACCORDING TO OCCUPATION (Dec. 31, 1933)

Occupation	Japanese	Koreans	Foreign	Total
Agriculture, forestry, stock-raising, fishery, etc.	49,239	16,341,220	8,923	16,395,382
Industry	68,888	431,413	8,056	508,357
Commerce and transportation	151,787	1,226,215	18,892	1,396,894
Public service and profession	230,185	600,360	1,862	832,357
Miscellaneous	21,746	1,256,112	4,612	1,282,470
Others	21,809	350,271	282	371,861
Total	453,104	20,205,591	42,626	20,791,321

Origin of the Korean Race

Though no conclusive opinion has ever been given as to the origin of the Korean people, it is evident that they are of the Mongolian family, and it is generally admitted that their cradle was in the neighbourhood of Changchun, Manchoukuo, in and around the place now called Petna on the River Sungari. It seems, therefore, but natural that they should have a profound liking to emigrate and settle in those parts of Manchoukuo. From various historic relics it appears that they were of the same stock with the Manchurians and those Japanese dwelling in the western half of Japan. In course of time much intermingling of blood seems to have taken place among the Koreans and the Chinese ever since Chinese colonies were first established along the north-western coast. But the latter did not supersede the native Korean race to any appreciable degree. This is clearly seen from the fact that the two races today have a distinctly different facial appearance, though both alike have black straight hair, dark oblique eyes and a tinge of bronze in the skin. The Korean language belongs to the Turanian group ; it is poly-syllabic and possesses an alphabet of 11 vowels and 14 consonants, and a script known as Eunmonn. In grammatical construction it is almost identical with Japanese, though in sound and vocabulary it is quite dissimilar. From all these and other facts and evidences it is beyond any doubt that these two peoples were akin to one another from very remote times.

Administrative Organization

Chosen is administered by the Government-General which was inaugurated on August 29, 1910, and has 8 main administrative offices, viz., (1) Governor-General's Secretariat, (2) Home Affairs Bureau, (3) Financial Affairs Bureau, (4) Industrial Bureau, (5) Judicial Bureau, (6) Educational Bureau, (7) Police Bureau, and (8) Forestry Bureau. There are also 5 affiliated offices which are (1) Communications Bureau, (2) Railway Bureau, (3) Monopoly Bureau, (4) Customs Bureau and (5) Tax Bureau.

Position of Koreans For a number of years since the establishment of the Government-General in Chosen all Koreans in government service were placed under different regulations from those applying to Japanese officials. Gradually, however, almost all discriminative features in treatment and salary have been wiped out and in October, 1919, Korean officials were finally placed on the same footing as the Japanese and came under the same regulations. Moreover, prior to March, 1920, in the courts Korean judges were allowed to try only those civil cases in which both parties were Koreans and the criminal cases where the accused were Koreans, but now they are allowed to try all cases in which people of any nationality may be involved. Moreover, prior to 1919 the freedom of the press had been rigidly restricted. No newspaper except the few already in existence was allowed to be issued. Now, however, more daily papers are issued, and the restrictions placed on the holding of public meetings have been partly removed.

The Central Council As the highest consultative body there is the Central Council which is convened by the Governor-General several times a year to discuss such measures as may be presented by him. This Central Council consists of 5 advisors, 65 councillors, 1 chairman and 1 vice-chairman. One of the characteristic principles by which the Japanese administration in Chosen is guided is respect for the old Korean customs and manners, and the work of investigating these old customs so dear to the native people is entrusted to the Central Council. Koreans attach great importance to their ancestral tombs as a form of ancient worship, and the selection of a burial site is always made with great care. This, coupled with their age-old superstition that the fate of one's family would be greatly affected by the position of its grave, has resulted in the devastation of a large area of land; wherefore the Government-General in 1912 issued an order requiring all people to use the public cemeteries for the disposal of their dead. This order, however, was revised in 1919 so as to allow the people to follow their old customs with only slight limitations set.

Finance

Budgetary System Introduced Under the old Korean régime there was no clear distinction between the court and the government in the use of money collected from the people in the form of various taxes. Moreover, most of the state revenue was from the ginseng monopoly, leasing of state lands, and granting of concessions of various sorts. Accordingly, therefore, there was no means of framing a yearly budget. This state of affairs, more than anything else, called for speedy remedies. When, therefore, a Japanese financial adviser, Baron Megata, took up his duties in August, 1904, his first task was to bring order out of this financial confusion and his work was quickly done during

Digitized by Google

the protectorate period. He drew up necessary plans for introducing the modern budgetary system, and the gold standard with a central bank to act as a state treasury and empowered with a right to issue convertible notes. A rigid taxation system was brought into existence, with the burdens of the people more equitably distributed. The former method of tax collection which gave rise to many serious abuses was quickly corrected. All the monopolies, such as that of ginseng, were turned over from the Imperial court to the government, and a clear distinction was marked between the finances of the court and of the state.

Japan in Chosen Upon the establishment of the Japanese hegemony in Chosen the Government-General took on its shoulders the heavy task of developing the country in every possible way so as to promote the welfare of the Korean people to the utmost extent. It necessitated starting new enterprises and increased expenditure, and the government outlay for the year 1911 reached over ¥48,740,000, an amount twice that of the preceding fiscal year. Since that time the tendency had always been upward, till it reached ¥246,852,843 in 1929, the highest mark ever seen in the budgetary history of Chosen. In 1930 a slight decrease was seen; the figures fell to ¥239,729,783, with a further slight reduction in each year until it reached ¥219,132,671 in 1932. Mention must be made of the fact that the determination of the Government-General to do its utmost for the economic development of the country and the promotion of the welfare of the people is shared by the Japanese government at home, for the latter is yearly advancing a subsidy of more than ¥15,000,000 from the national treasury to the Government-General.

The budget again took an upward turn in 1933, and in 1935 it reached the highest mark of ¥288,388,664. Below is given a budget table showing the trend of steady expansion of expenditure:

BUDGETS 1911—1935

	Revenue yen	Expenditure yen

Government Monopolies

Several industries are being carried on as monopolies by the Government-General under direct control of the Financial Affairs Bureau; they are the manufacture or preparation of ginseng, tobacco, salt and opium.

Digitized by Google

Ginseng This medical herb is regarded as a wonderful cure for many diseases in China and Korea. The drug is obtained from the root of the plant carefully tended for six years. The principal customers for this plant are the Chinese, who are ready to pay a high price for it. Figures relating to its production follow:

	Area (tsubo)	Raw root (kin)	Prepared product (kin)	Receipts (yen)
1911	14,345	7,719	2,300	119,000
1919	195,620	103,989	26,002	2,082,000

1933	—	142,686	49,525	1,339,941

Tobacco As practically all Koreans smoke, the tobacco industry is a great source of income to the government. Three kinds are grown in Chosen, namely, Korean, Japanese and American. There are four tobacco manufacturing centres, these being Keijo, Heijo, Taikyu and Zenshu, the annual production reaching thirty million yen.

AREA, PRODUCTION & SALES OF TOBACCO

Year	Area (cho)	Amount leaf tobacco (kwan)	Value in yen: Korean product	Imported	Total
1930	14,227	4,026,914	31,698,010	123,100	31,816,110
1931	15,232	4,884,183	31,149,374	99,751	31,249,125
1932	13,637	5,309,923	32,076,449	91,290	32,167,739
1933	13,558	4,414,268	35,227,038	87,148	35,313,186

Salt The salt consumption in Chosen amounted to 560,000,000 kin in 1932 which is a great increase as compared with the amount ten years ago. The consumption in 1921 was 114,000,000 kin valued at ¥1,120,000. As the native production is not sufficient to meet the entire demand of the people, a considerable amount is imported from Japan and foreign countries under the control of the Monopoly Bureau of the Government-General. The following shows production and the area of salt-fields in 1932:

PRODUCTION AND AREA OF SALT-FIELD IN 1933

	Area (cho)	Production (kin)
Koryowan	1,142	155,620,000
Shusan	1,115	154,196,000
Nanshi	217	26,725,000
Total	2,474	336,541,000

Opium Owing to the strict control of the Government-General the number of opium smokers has in recent years greatly decreased, but at the same time the number of those indulging in morphine-injection has increased. The use of morphine has of course been prohibited by the government, but owing to the activity of cunning dealers all the efforts of the government to put an end to it have been fruitless. The government thereupon has come to the decision to monopolize the manufacture and sale of morphine so as more effectively to control the spread of its use. Accordingly, in March, 1933, the government's manufacture of morphine was started at Keijo, its production being sold to certain designated pharmacies to be used for medical purposes only.

Overseas Trade

Prior to its annexation by Japan the overseas trade of Korea amounted to about 50 millions of yen a year. Now it is approximately valued at ¥368,627,000 as per figures for 1933. The following figures indicate its development:

OVERSEAS TRADE

Year	Exports (¥ 1,000) Foreign countries	Japan	Total	Imports (¥ 1,000) Foreign countries	Japan	Total

Banking

Banking on a modern system was first introduced into Chosen in 1878 when the Dai Ichi Ginko of Tokyo established a branch office at Fusan. Later on, the Juhachi Ginko of Nagasaki opened branches at Jinsen and Gensan. After the China-Japan War these banks opened their branches in Keijo and other centres, while two native banks, the Chon-il (later renamed the Korean Commercial) and the Hansong, came into being in Keijo.

In 1902 the Dai Ichi Ginko was authorized to issue bank notes for circulation within Chosen. In 1906, to promote economic development in the provinces, agricultural and industrial banks were formed in several of the principal towns, the Government taking shares in them or granting them loans free of interest, and in the same year a third native bank called the Han-il was founded in Keijo.

In 1909 the Bank of Korea capitalized at ¥10,000,000 was founded in Keijo as a de jure central institution, and to it was transferred all the functions belonging to a central bank hitherto performed by the Dai Ichi Ginko. After the Annexation the bank was renamed the Bank of Chosen and branches were opened by it one after another in important places. Nor was its sphere of activity confined to the peninsula, for many branches were opened in Manchuria where it enjoyed free circulation of its notes, and its activity even penetrated North China and East Siberia. The Bank also made loans to China, and opened an agency in New York with a view to facilitating exchange operations and to utilizing the American money market for the development of Chosen and Manchuria. Stimulated by the steady expansion of its business, the Bank increased its capital to ¥40,000,000 in 1918, and to ¥80,000,000 in 1920, while authority was given to increase its maximum limit of note

Digitized by Google

issue as occasion demanded; but owing to continued business depression the Bank suffered severe losses and was compelled in 1925 to reduce its capital by one-half. (See Chapter IX, the Bank of Chosen.)

Since then, encouraged by the economic development in general, and especially influenced by the war-time boom, many local banks were established in the country. During this time, however, the agricultural and industrial banks in existence were found much too weak to cope with the increasing demand for funds, their capital all told being only ¥2,600,000, so in 1918 they were all merged into the Industrial Bank of Chosen under special government protection, with a capital of ¥10,000,000, which has since been trebled.

The first clearing house was opened in 1910, and banks in Keijo became its members. Later additional clearing houses were established in Jinsen (Chemulpo) and other large commercial centres—the total number being nine at the present time.

In 1911 there were in Chosen only 11 banks with 59 branches. The total aggregate capital was then ¥12,350,000, with total reserve funds amounting to ¥366,000 and the deposits totalling ¥18,335,000. In 1933 the number of banks was 11 and their branches 163. The total aggragate capital increased to ¥121,075,000 and the deposits to ¥458,159,000. The following gives a more detailed account:

The banking institution which is utilized most by the Korean masses is the Post Office Savings Bank. In 1921 there were about one million and a half depositors at this bank, their aggregate deposits reaching ¥18,726,338. In 1933 the number of depositors increased to 2,840,656, with the aggregate deposit expanding to ¥48,807,154. The following figures show the annual expansion:

Digitized by Google

	Number of depositors	Amount (yen)
1921	1,416,325	18,726,338
1922	1,590,470	19,875,093
1923	1,694,087	21,040,342

1933	2,840,656	44,807,154

Agriculture

Chosen, though mountainous, is essentially an agricultural country. It is enough to point out that more than 83 per cent. of its entire population is engaged in agricultural pursuits. Though the soil is not very fertile, it is sufficiently so to produce enough foodstuffs to support its entire population.

In 1933 the total agricultural products amounted to ¥641,600,000, of which ¥204,400,000 worth was exported, mostly to Japan, forming 55 per cent. of the entire value of Korea's export trade. In 1910, the year of annexation, the value of production scarcely reached ¥250,000,000, but in 1930 it more than doubled the above figure. Of all agricultural produce rice is the most important.

Ka-den-min In Chosen there are quite a good number of so-called "ka-den-min" or fire-field-people, who use fire for making their land ready for cultivation in a most primitive way. In ancient times, people set forests or plains on fire and then sowed seeds and cultivated vegetables on the blackened land without manuring. When this land became sterile, they moved to another place to repeat the operation. Among the lowest class of Chosen peasants this primitive system of agriculture is still in practice. There are nearly 400,000 ha. of the fire-field on which about 230,000 families or 1,160,000 people are living. They are mostly distributed over such northern mountainous districts as South Kankyo and North Heian. They plant the sweet potato, German millet, Indian-corn, soy-bean, red-bean, barley and buckwheat. Steep slopes or mountain tops, even above 1,200 m. in height, are burnt by these farmers. One of the causes of the bare hills noticed by visitors to Chosen is said to be this long practice of burning the forests. Most of these people are nomadic and cultivate about 2 ha., the average family with an income of about 60 yen a year. After the establishment of the new Japanese Forestry Bureau the forestry police have been taking measures to prevent the continuance of this destructive practice by teaching these peasants a better method of farming; but all their efforts seem in vain so far.

Grains In 1910 the rice fields covered a total area of 1,350,000 cho, yielding 10,400,000 koku, which rose in 1933 to 1,697,000 cho and 18,192,000 koku, its export during the same period increasing from 798,000 koku to 7,990,000 koku. This wonderful development has been achieved by the improvement made in cultivation, in the selection of seeds and manure, and in irrigation and reclamation. Next in importance come barley, wheat and rye, which are, however, mostly cultivated for home consumption. In almost every province these grains are raised in the paddy fields, after the rice crop is harvested, production of these in 1933 being 7,585,000, 1,762,000 and 1,023,000 koku respectively. Owing to the help in various ways given by the authorities to aid in the cultivation of these three cereals, their production has been on the increase year after year. Third in importance comes the soy bean. In

Digitized by Google

earlier times it was far from being an important produce owing to ignorance on the part of Korean farmers of the proper method of preparation, such as drying and assorting. It is now, however, in high esteem on the Japanese market where there is a demand for it not only as food, but for chemical industrial purposes, and thus the amount exported to Japan is yearly on the increase. In 1933 the total area under cultivation was 803,000 cho and the amount produced reached 4,555,000 koku, which was an increase of more than six times, compared with the year 1910. Millet is for most Koreans what rice is for the Japanese people. They depend more upon it than upon rice on account of its cheapness in price. The Korean farmers sell their rice, but use their millet crops for their daily diet, so that the supply of the grain hardly suffices to meet the entire demands of the Korean people. They, therefore, import much of it from Manchoukuo, its import from that region reaching about one million koku in 1933.

Cotton Cotton is another important agricultural produce in modern Chosen. The present scale of its growth is owing to the encouragement given by the Government-General. It was in 1906 that the first trial plantation of American cotton was carried out in the neighbourhood of Mokpo. As its superiority over the old native cotton was sufficiently demonstrated, soon its cultivation was vigorously encouraged in all parts of southern Korea, so that the cotton acreage was increased from 1,200 cho in 1910 to 117,000 cho in 1933, and the crop expanded from 660,000 kin in 1910 to 114,313,000 kin in 1933. If the production of the native plant is added, the total cotton production in 1933 amounted to 159,415,000 kin from the total area of 159,000 cho, as against 21,000,000 kin from 60,000 cho, in 1910.

Sugar Beet A trial plantation of sugar beet was also made first in 1906. As it proved quite satisfactory every governmental assistance was given to its cultivation. A subsidy was given to ensure a sufficient distribution of improved seeds. Further exhaustive experiments proved that Keijo and its vicinity is best suited for sugar beet cultivation and consequently the authorities encouraged and assisted its plantation in that part of Chosen, with very good results.

Fruit Farming Fruit farming has also become a thriving industry of the erstwhile hermit kingdom. Soil and climate alike are suitable, especially for the growing of apples, and the government authorities are extending their assistance in this direction likewise, with the object of improving the quality of the fruit and gaining for it a world-wide market.

Many new varieties of apple, superior to the old native ones, are now cultivated, the quality being in some cases better than that of the fruit grown in Japan, the recent annual production reaching as much as 12,447,000 kwan with money value estimated at ¥4,311,000.

Sericulture By 1910 the Government-General had done everything in its power to improve the native methods of cultivating the mulberry trees and raising silk-worms after the Japanese fashion. In 1919 a new system was instituted for carrying on a compulsory examination of egg-cards and for giving adequate care to the growing of good mulberry trees. All this paternal care and effort on the part of the Government-General for the advancement of the economic welfare of the Korean farmer was by no means thrown away. In 1910 the

Digitized by Google

cocoon production was 14,000 koku and the number of households engaged in the work was figured at 76,000. In 1931 the households increased to 747,084 and the output to 578,259 koku ; in 1932 the number of households increased to 786,060 and the output to 593,054 koku and in 1933 the number of households increased to 810,000 and the output to 608,000 koku.

Stock Farming As Korean beef is very palatable, the demand for it is rapidly increasing in Japan and Manchoukuo as well as in Siberia. In 1910 the cattle in all Chosen numbered only 700,000 head, which in 1933 increased to 1,663,000. The export of cattle and hides totals from ¥5,000,000 to ¥8,000,000 a year. The raising of both pigs and poultry has been greatly encouraged by importing from Japan animals and birds of superior quality, with the result that at the end of 1932 the former totalled 1,339,000 and the latter 6,601,000, and in 1933 the former 1,430,000 and the latter 6,868,000, both more than doubling the numbers found in 1910. Sheep were unknown in the old days in Chosen. In 1919, however, efforts were made to encourage their rearing, but the number is still insignificant with less than 3,000 in all.

Forestry

The area of forests in Chosen covers 16,440,000 cho which corresponds with 73 per cent. of the entire area of the land. But there existed before 1910 nothing like a forestry policy in Korea, and except a few protected ones, all forests were allowed to be devastated by ignorant and superstitious people. Therefore before 1910 nearly all the mountains in Chosen were treeless. The forests existed only in name. As a matter of fact, only one-third of the so-called "forest" areas was covered with standing trees, the remaining two-thirds being only thinly wooded. There was no system for safeguarding or protecting forests.

Afforestation Work Undertaken In 1908, however, the Korean government, by the advice of the Japanese, promulgated a forest law aiming at the protection of forests, and when the new régime was established the Government-General issued a new forest law providing, among other things, for the letting of forest lands to any interested party for the purpose of afforestation and, if the work were successfully carried out, the ultimate transference of them to the lessee. The total area thus leased now reaches 1,318,000 cho, of which more than 637,000 cho have been transferred to the successful planters. So far as the present situation is concerned, 5 million cho of the entire forest lands is owned by the state, and one hundred and twenty thousand cho is reserved for university research and as national parks, the rest being owned by private persons. The first public afforestation work was started in Kogen province in 1911, and this example was followed by almost all the other provinces, so that the total area afforested to the end of 1933 was 1,564,000 sq. m. There are at present 275 seeding plantations, where mostly pine, oak, chestnut, poplar, larch, etc. are being raised. In 1932 about 190,000,000 seedlings were grown by private undertaking, since the seedlings raised by the public plantations alone were not enough. Nor is this all. Schools are given suitable pieces of ground whereon to plant trees, and the Third of April, the anniversary of the death of Jimmu Tenno, the first ruler of Japan, is fixed as Arbour Day, a day on which universal plantation of trees is encouraged throughout Chosen. In short, in the past

Digitized by Google

twenty years more than a million cho have been planted with over 4,687,000,000 trees, and thus the mountain scenery in every part of Chosen is steadily undergoing a change with the accompanying effect of diminishing floods.

The Forest Districts There are, however, several forest districts which escaped the almost wholesale denudation by ignorant woodsmen and kadenmin before 1910, the most important of which is the forest along the upper reaches of the Yalu and Tumen Rivers on the frontier. In 1906 the first systematic exploitation of the region was conducted by a joint undertaking organized by Japanese and Koreans and assisted by both the Korean and the Japanese governments with a capital of ¥1,200,000. This, combined with a similar enterprise financed by a group of Japanese and Chinese industrialists, forms one of the largest timber-supplies in the world. Due, however, to further deforestation by kadenmin, the government considered it necessary to further educate these ignorant Koreans, and to utilize and develop the forests. Since 1932, the government started the work of developing these forests in northern Korea with an expenditure of ¥12,183,000 to be operative for 15 years. The work consists of (1) development and utilization of forests, (2) education of kadenmin, and (3) protection of the forests. The results of this work are proving satisfactory, the education of kadenmin giving especially good results.

Fisheries

Since 1910 all sorts of encouragement have been given to the Korean fishermen for the development of the fishery industry in Chosen, with the result that improvements in one way or another have been introduced in the building of fishing-boats and in the method of catching. Thus, while before 1910 the total value of catches used to be about ¥8,000,000 a year, by 1933 it increased to ¥51,370,000, and other aquatic products in the meantime advanced from ¥2,650,000 to ¥38,490,000. The first fishery law in Chosen was issued in 1909, and this was replaced three years later by a new law providing for the definite establishment of fishing rights over a certain area of waters, the prohibition of certain actions harmful to fishing in specified areas and the prevention of individual monopolization of any fishing area. Trawling within special zones was also prohibited, and certain restrictions were made to the number of whaling-boats and to the diving apparatus carried. Mention should be made in this connection of the famous "hanyo" (woman divers) of Quelpart Island. There are 7,000 of these women and they are engaged in catching sea-ears and many kinds of shellfish and gathering laver and other sea-weeds by diving into the deep sea. The total earnings of these women amount to one million yen a year.

The following shows the marine products for two years, 1932 and 1933, the value of each of which exceeds ¥1,000,000:

Kind	1932 Value (in yen)	1933 Value (in yen)
Mackerel	5,258,000	6,384,000
Sardine	6,178,000	8,789,000
Guchi	3,340,000	3,706,000
Laver	2,294,000	—
Herring	1,726,000	1,902,000
Sea-bream	1,763,000	1,537,000
Hair-tail	1,270,000	1,642,000
Plaice	1,868,000	1,223,000
Cod	1,784,000	1,537,000
Horse-mackerel	1,140,000	—

Digitized by Google

Kind	1932 Value (in yen)	1933 Value (in yen)
Shrimps	1,845,000	1,644,000
Mintai (Alaska pollack)	1,969,000	3,549,000
Mackerel-like fish	1,659,000	1,404,000

Besides these, there are isinglass, yellow-tail, glue, shark, grey mullet, rays, oyster, sea-eel, conger-eel, etc., valued each at between ¥500,000 and ¥1,000,000.

Mining

The present mining law, enacted in 1916, provides that mining rights can be granted only to Japanese citizens or to legal corporations under the Japanese law, and mining rights are treated as a form of real estate. As for mining rights secured by foreign citizens under the old régime, they are well respected. Of all minerals produced in Chosen gold occupies by far the most important position, the largest gold mine being the Unsan Mine operated by an American syndicate called the Oriental Consolidated Mining Company. Next in importance are the Shojo Mine worked by Frenchmen, the Suian Mine by Englishmen, and Sansei and Koyo Mines by Japanese. Formerly the mining industry in Chosen was carried on in a very primitive way except in those mines operated by foreign concerns. Soon after Chosen had been brought under Japanese protectorate rule in 1906 the Government tried hard to induce Japanese capitalists to invest capital in the mining industry of Chosen, but it was only in 1910 that Japanese capitalists began to display their energies in that lucrative undertaking. As, however, most of the more promising gold fields were already under operation by foreign capitalists, Japanese capitalists turned their attention to the exploitation of other minerals such as iron and coal. Iron ores in Korea hitherto found were mostly of hematite and limonite, the former being found in South Kankyo and Kokai provinces and the mixture of the two in South Heian and Kokai provinces. The amount of these ores stored, the purity of which is about 50 per cent., is estimated at about 20,000,000 metric tons. In 1933 about 500,000 metric tons of these ores were mined, of which about 260,000 were sent to the Kenjiho Iron Works and the balance of 250,000 metric tons shipped to Japan proper. Fortunately a much greater store of magnesite ores is found in North Kankyo province. The purity of these magnesite ores is about 40 per cent. on average.

As regards coal, almost unlimited quantity of brown and anthracite coals are stored in Korea, the quantity of the latter stored being especially large. Anthracite is mostly produced in the Heijo coal-field, and in South Kankyo, North Keisho and South Zenra provinces.

It must be mentioned that in Chosen nearly all kinds of minerals except sulphur, petroleum and asphalt are found in more or less abundance, gold, coal, and iron preponderating. The following shows the value of the mineral products of Chosen, expressed in yen:

MINERAL PRODUCTION

(in 1,000 yen)

Manufacturing Industry

It is only since 1916 that there has been any manufacturing industry worthy of the name in Chosen, and in 1933 the total value of manufactures reached ¥378,700,000, being over 12 times as large as that in 1911, in which year the total output was valued at ¥30,000,000. As the land has abundance of materials and a good labour supply, Chosen may be looked upon as a promising land for the future expansion of various industries. In 1911 there were in all the land only 251 manufacturing plants employing about 14,575 workers, but by 1933 this number of factories had increased to 4,836 and the total number of employees to 120,251. The most important manufactures are:

(1) Cotton, hemp, and silk tissues, the total output in these goods expanding from ¥5,000,000 in 1911 to ¥55,359,000 in 1933.

(2) Paper, which increased from ¥382,000 in 1911 to ¥3,816,000 in 1929. Of late years the demand for foreign-style papers has grown, the imports expanding from ¥800,000 in 1911 to ¥8,615,000 in 1933.

(3) Ceramics, which show a yearly output worth ¥9,034,000 to ¥13,000,000.

(4) Iron-wares, the annual production of which is now valued at ¥6,231,000.

(5) Fertilizers, which have an output of ¥5,292,000 a year.

(6) Tobacco, the total output being ¥32,451,000 in 1933.

(7) Marine products, the total product being ¥8,460,000 in 1933.

Justice and Police

Chosen has now a judicial system similar to that of Japan. That is to say, in addition to the supreme court there are courts of appeal and local courts, the last-named having detached and sub-detached courts widely located. Both civil and criminal cases are first tried by local courts, while appeals against the decisions of local courts are made to the courts of appeal. The supreme court handles those appeals made against judgements rendered by the local courts or complaints against decisions or orders rendered in the second instance by the courts of appeal. Grave crimes of one sort or another have greatly diminished owing to the improvement in the work of maintenance of order and security. On the other hand, what might be called intellectual crimes such as fraud, forgery, and perjury have yearly increased. Prior to the establishment of the Japanese administration flogging was a common form of punishment. In 1912 its application to aged persons, women and children was prohibited,

Digitized by Google

and in 1920 it was finally abolished as it was unsuited to modern ideas of penology.

Police The police service in Chosen had been under Japan's direction for some years even prior to the establishment of Japan's protectorate in 1906. But the system which had been in force at that period proved unsatisfactory. Accordingly, in June, 1910, a new system was introduced by which the commander-in-chief of the military police was appointed chief of police, and gendarmes and civil policemen were separately stationed as local needs required. In 1919, however, that semi-militaristic police system was displaced by the one now in force. This new and present police system is modelled on that in Japan proper, with its headquarters entrusted with the entire administration of police and sanitary affairs. Numbers of administrative officials of police, police superintendents, polic inspectors, police, etc. as of 1933 follow:

Class of officials	Japanese	Koreans
Administrative officials	13	—
Police superintendents	48	9
Police inspectors	338	86
Assistant police inspectors	604	154
Police	10,163	7,913
Total	11,166	8,162

Education

In the olden days Korean children were taught in school nothing but Chinese writing and classics, but soon after the new régime was introduced they began to receive a more modern education, with such new subjects as arithmetic, geography and the Japanese language. The parents at first objected to the introduction of these revolutionary methods, and specially to the forcible teaching of the Japanese language, believing that this was a deliberate attempt on the part of the government to deprive the Korean children of their national and inherited traditions. It was due to this misconception held widely among the Korean people that the educational authorities found much difficulty in enrolling pupils despite the fact that no tuition was charged and all textbooks were supplied to the pupils free of charge. In 1930 the Government-General, animated by a desire to respect the wishes of the native race and to foster oriental morals developed by Confucius, reopened the old Meiringaku-in (Confucian Institute) at the Keigaku-in (formerly known to Koreans as the "Songkyun Kwan."), the oldest and highest seat of learning in the country for the study of the Confucian classics.

Important Reforms But many more reforms of far-reaching importance were made in 1920, when the present educational system was introduced. By it not only was the standard of educational attainment raised, but the principle of equality was laid down firmly though no compulsory features were adopted with regard to elementary education, as in Japan. The following differences, however, were made and are maintained out of respect for Korean sentiment.

1. The Korean language is made an obligatory subject in schools for Korean children exclusively, while it is optional in schools for Japanese children in Chosen.

2. The teaching of Korean history and geography is to be particularly emphasized in schools for Korean children.

3. Different text-books, though of an equal standard, may be used in view of the difference of language and customs of the two races. That is to say, schools for Japanese children may use text-books compiled by the Education Department of

Digitized by Google

Japan, but schools for Korean children those compiled at the Education Bureau of the Government-General. Koreans are mostly educated in common schools, higher common schools and girls' common schools. The term of the common school is six years, while that of the higher and girls' higher common school is two years. Korean children who prefer to receive education at the Japanese school may enter the elementary or the middle school as they chose. The system proved very efficacious in developing the education in Korea. While there was only 100 common schools before 1910, they number now 2,105 with 565,000 pupils. The table below shows cleary the development of educational work in Chosen since 1910:

	1911		1919		1933	
	Schools	Students	Schools	Students	Schools	Students
Elementary schools	128	15,509	380	42,811	479	79,397
Common schools	172	20,121	482	89,288	2,105	561,920
Middle schools	1	205	5	2,010	11	6,847
Higher common schools	5	819	12	3,156	26	12,610
Girls' high schools	3	515	11	1,905	25	9,558
Girls' higher common schools	2	394	6	687	17	5,179
Normal schools	—	—	—	—	3	1,891
Industrial schools	20	961	25	2,848	58	14,823
Elementary industrial schools	3	93	73	1,650	97	4,235
Colleges	5	409	8	901	15	3,770
University preparatory schools	—	—	—	—	1	314
University	—	—	—	—	1	609
Non-classified schools	1667	71,763	749	39,247	457	58,714
Total	2,006	110,789	1,751	184,498	3,295	763,038

Christian mission and other rivate schools are included in this table.

Korean Students in Japan The Korean students in Japan now number about 4,087, most of them being in Tokyo. Those sent by the Government-General are comparatively few, numbering only nine at present. The students sent by the Government-General are not only supplied with necessary funds by the Government during the period they stay in the colleges to which they have been sent, but are on graduation given official or educational positions.

Religion

Buddhism Buddhism first entered Korea about 370 A.D. It was introduced from China by a priest who brought with him a Buddhist image and the "sacred books", and it flourished greatly in the peninsula during the days of Silla and Koryu. Under the dynasty of Yi, however, it met with persecution. The number of priests was limited and members of good families were forbidden to enter the priesthood, with the consequence that it soon lost its hold among the masses to a large extent. Things remained so until Japan extended her rule throughout the country. Then in September, 1911, an ordinance on religions was promulgated giving freedom of preaching and full protection to temples, and also raising the status of the priesthood. Since then Buddhism has been revived to a marked extent, so that at present there are 1,338 temples with 5,712 priests, 1,080 nuns and 128,000 adherents. There are several native religions not recognized by the Government-General, among which the most influential one is the Tendo-kyo, which in nature is a mixture of Confucian-

Digitized by Google

ism, Buddhism and Taoism. This religion has followers numbering 82,200. Apart from Korean Buddhism and allied sects, we find Japanese forms of Buddhism lately established in the peninsula, priests of the Shin sect being the pioneers. Later three others, Jodo, Soto, and Nichiren sects, entered the new religious field in competition with other sects and religions. At present nine sects of Japanese Buddhism are working among the resident Japanese as well as among the Korean masses, and at the end of 1933 there were 123 temples, 441 preaching houses, 597 priests, and 241,800 believers including 8,200 Koreans.

Christianity Christianity in Chosen was first brought by an official mission sent to Peking, China, by a Korean king in the latter half of the 18th century. This mission brought back with them a Bible and other Christian books. As its teaching, however, ran counter to the deep-rooted custom of ancient worship, King Seiso in 1784 issued an order prohibiting its preaching which was followed by a severe persecution. Though later occasionally the persecution was more or less relaxed, nothing for a time indicated a revival of Christianity. In 1833 a French missionary named Pierre Maubant came to Chosen to preach the Gospel. He was the first foreign missionary to tread the soil of the hermit kingdom. His energetic and devoted evangelistic work was not fruitless, but it alarmed the government officials, who in 1839 issued a prohibition edict. But it failed to suppress the spread of Christianity, and in 1863 there were as many as 18,000 converts. In 1866 the persecution against Korean converts was renewed with vigour, which cost the lives of 30,000 people. In 1882, however, freedom of worship was fully recognized in the country as a result of diplomatic pressure brought upon its government, and in 1885 several American missionaries came to Korea. This was the first time for Protestantism to be preached there, and it gained influence among the masses as time went on. When in 1906 Prince Ito, the foremost Japanese statesman at that time, was appointed first Resident-General, he pursued a policy of friendliness toward these foreign missionaries, this policy being pursued up to the present day under various Governors-General. The following table gives an idea on the present situation of Christianity in Chosen:

	No. of missions	No. of missionaries	No. of members
Presbyterian	2,583	1,489	239,235
Roman catholic	327	184	95,520
Japan episcopal church	87	91	6,390
Japan christian church	12	15	1,802
Holiness	156	267	10,645
Methodist	16	21	1,655
Salvation army	74	77	6,523
Others	1,014	503	60,810
Total	4,269	2,647	422,580

Communications and Transportation

Railways The construction of railways as a civilizing agency is being vigorously carried on in accordance with the 12 year programme laid in 1927. The programme covers the construction of a Tumen River line and four other lines totalling 1,384 kilometres and the purchase of five lines including the Zenshu-Riri

Digitized by Google

Railway, totalling 339 kilometres. At the end of 1933 the total government-owned railway mileage reached 2,935 kilometres in active operation with 413 stations. The following gives some idea of the development of railways in Chosen:

	Length (kilo)	Passengers	Freight (tons)	Receipts (yen)
1911	674 (miles)	2,024,000	888,000	4,095,000
1920	1,157 („)	12,421,000	3,186,000	28,816,000
1925	1,309 („)	18,241,000	4,297,000	30,708,000
1930	2,792	20,650,000	5,986,000	36,821,000
1931	3,009	19,673,704	6,025,150	36,300,512
1932	3,142	20,591,638	6,248,863	40,154,103
1933	2,935	22,238,338	7,254,859	43,611,142

As the through traffic between Tokyo and Europe is now established, the two main lines, Keijo-Fusan line and Keijo-Gishu line, form an important part of the railway system connecting Europe and Japan. Of all the lines now under construction the most important one is the line between Heijo and Gensan, 213 kilometres in length. When completed it will serve as an important traffic link between North China and Japan. As for the private railway enterprises in Chosen, regulations were issued in 1912 so as to provide adequately for effective supervision and protection. In 1921 new regulations were issued by which increased state aid was extended to private railway undertakings. These have in consequence made rapid progress, and at the end of 1933 their total mileage reached 1,163 kilometres operated by seven companies, though their earnings are far from being satisfactory. There are at present over 387 kilometres of additional lines either under actual construction or projected.

Tramways The following are the main tramway lines now in operation:

43.6 km.	in Keijo
9.8 „	in Fusan
12.9 „	in Heijo
6.1 „	in Kanpei
1.1 „	in other parts
Total	73.5 kilometres

Navigation There are now 235 steamships the total tonnage being 57,920 tons, their routes being interport, Korea-Japan and Korea-China-Russia. The following table shows the progress in this method of transportation in the last decade:

	Steamers		Sailing-boats	
	Number	Tonnage	Number	Tonnage
1919	87	35,682	483	16,432
1925	147	44,520	627	21,075
1929	185	47,161	694	23,083
1930	196	53,998	692	22,911
1931	202	52,802	745	24,778
1932	223	57,512	756	24,889
1933	235	57,920	796	26,578

Navigable Rivers The most important river in Chosen is perhaps the Yalu or Oryokko which, forming the boundary line between Chosen and Manchoukuo, rises in the Paktusan or "Ever-white" Mountains (2,744 m.) and empties into the Yellow Sea. Its length is about 800 km. of which about 700 km. is navigable by air-propeller boats under governmental subsidy. Timber felled on the mountain slopes is made into rafts and floated down until it reaches the lumber-yards at Shingishu or Antung. Another river of importance is the River Daido which flows through Heijo and empties into the Yellow Sea in the neighbourhood of Chinnampo. The river is 400 km. long, navigable for a distance of 245 km. There are also four other

Digitized by Google

rivers wide enough for navigation by sailing boats and motor boats. These are:

Rakuto (flowing into Chosen Channel) 344 km. (Navigable course)
Kanko (flowing into Yellow Sea) 300 km.
Kinko „ „ „ „ 180 „
Tumen „ „ „ „ 85 „

Airways There are at present three airports established in Chosen. These ports are located at Urusan, Keijo and Heijo. Beside that in the following places ground marks are set up: Urusan, Kwokan, Taiden, Tenan, Sharlin, Heijo, Teishu and Shingishu. Moreover, in Urusan and Keijo there are now built wireless stations for keeping in communication with the airways. At the airport of Urusan there is installed a meteorological observatory for forecasting weather conditions in the interests of air navigators. Most of the air traffic between Chosen and Japan is being done by planes belonging to the Japan Air Transport Company.

Post, Telegraphs and Telephones Prior to 1905 there were 516 postal offices in the peninsula. In March, 1934, they numbered 948, but in this are included 119 engaged for telegraph and telephone service exclusively. There is a Telegraphic Service Training School, which had turned out up to March, 1931, 3,252 graduates, 909 being Koreans. In November, 1926, a Radio Broadcasting Office was established in Keijo and opened to business in February, 1927.

Public Hygiene

Prior to 1906 Chosen was a land practically without access to any medical service worthy of the name and the sick were simply placed under the care of unqualified practitioners of the old Chinese school or of witches or magicians. The situation was made worse by an entire lack of sanitary equipments and pure water, the consequence being frequent outbreaks of various infectious diseases. As soon as the protectorate was brought into existence in 1906 the first step taken by the government with a view to giving the nation the benefit of sanitation was the establishment of a modern hospital in Keijo. Since 1910 further steps have been taken to extend modern medical and sanitary benefits among the masses, even among those in very remote regions. The construction and extension of waterworks is another work pushed on by the government with vigour so as to provide the people with good drinking water. The Government-General has also taken efficient and energetic measures for the prevention of epidemics; in consequence, small-pox which was formerly so virulent in Chosen, has almost died out. Moreover, sanitary regulations relating to foodstuffs, drinks, and drugs are rigidly enforced. Medical and hospital equipments have been greatly improved. At the end of 1933 hospitals numbered 134 including 4 government institutions and 45 under local public authorities, and there were 2,100 licensed medical practitioners including 964 Japanese, 1,094 Koreans and 32 foreigners. Korean medical students numbered 4,267 in the same year.

Prohibition of Opium Smoking

Soon after its inauguration the Government-General made a serious effort to deal with opium-smoking. The habit of opium-smoking among

Digitized by Google

the Korean people had been quite strong, specially among those in the frontier regions, many deaths resulting therefrom. The Government-General's drive for the abolition of this vicious habit was a thorough one. Those who were found smoking opium were made liable for criminal punishment. It would be, however, an exaggeration to say that the land was entirely freed from the evil, as much opium is still being smuggled in from China. In 1919 poppy cultivation was absolutely prohibited except for the purpose of supplying the needs of the medical profession and a certain limitation was placed on the area of its cultivation, and the product so raised was not permitted to be sold on the general market, being all taken over by the government at a fixed price. In 1930, the Government-General granted a subsidy of ¥16,240, in addition to sufficient money to buy a necessary quantity of morphine to be divided among the provinces to assist in the cure of addicts. As a result 2,837 addicts out of a total of 2,944 treated at the provincial morphine asylums were completely cured. The following is the policy now being pursued by the Government-General in its effort to conquer the evil of opium-smoking:

(1) To attempt to cure all morphine addicts within 10 years;

(2) To take into its own hands all the work of manufacturing and selling the morphine to be supplied to the registered addicts;*

(3) To permit no person other than those registered to use morphine, and to punish heavily those who smuggled or secretly sold it;

(4) To educate the people so as to prevent any increase of addicts.

On March 3, 1930, the Government-General issued an order forcing all addicts to be registered and in the end of that year those who registered totalled 3,278 out of 5,094 persons known to be addicts.

* The government manufacture began March, 1933.

CHAPTER XLI

TAIWAN (FORMOSA)

General Description

Area and Topography Taiwan (Formosa) forms the westernmost part of the Japanese Empire. It is washed by the Pacific on the east, and is separated from China on the west by the Formosan Straits and on the south from the Philippines by Bashi and Balintang Channels. It extends from 119° 18′ to 122° 6′ E. longitude, and from 21° 45′ to 25° 38′ N. latitude. The Tropic of Cancer bisects the island, which is about 394.28 km. long, its greatest width being 122.31 km. The Pescadores (Bokoto) and other outlying islands form a political division of the Taiwan Government-General. They cover 126.86 sq. km. The area of Taiwan, including the Pescadores, is 35,973.55 sq. km., being about 5.3 per cent. of the total area of Japan, a little smaller than Kyushu, and about one-sixth the size of Chosen (Korea). As regards its topography, Taiwan is an island which rises from the sea to a height of 3,950 metres, reached at the summit of Mount Niitaka (Mount Morrison). It consists of a mountain range with narrow valleys on both coasts which are the population centres. The valley on the west coast is the principal population centre. That on the east coast is little developed and is capable of but slight further development. The rivers are not long and their current is very swift; in the rainy season they flood the surrounding country, causing much damage. The climate is semi-tropical. In summer the north is visited by rains; in winter the south. The temperature rarely falls below the freezing point.

The Inhabitants The territorial system of Formosa was organized during five years, 1898 to 1902, by a large land-investigation enterprise made by the Government-General. The island is inhabited by Japanese, natives and foreigners. The Japanese went there after the occupation of the island by Japan, and the foreigners mostly are Chinese. The number of Western people is small. The native Chinese are mostly Mins from Fukien province and Cantonese from the China coasts across the Formosan Straits, composing 92 per cent. of the total population. The aborigines consist of savages and semi-civilized tribes. The following figures show the population at the end of 1933 :

	Total number	Male	Female	Percentage
Japanese	256,327	135,836	120,491	5.1%
Koreans	1,191	417	774	0.0
Natives	4,759,197	2,421,881	2,337,316	94.0
Aboriginal savages (Included in natives)	146,923	73,755	73,168	(2.9)
Chinese	43,585	28,856	14,729	0.9
Foreigners	207	110	97	0.0
Total	5,060,507	2,587,100	2,473,407	100.0

Including the savages, the total population at the end of 1933 in Taiwan was 5,060,507, showing an increase of 130,545 over that at the

Digitized by Google

end of 1932 and 2,023,648 over the end of 1905, when the first census-taking results were announced. This means a yearly again for the 28 years of 72,273.

The areas, population, number of counties and districts and number of towns and villages of five provinces, three districts and seven cities at the end of July, 1933 follow :

	Area sq. ri	Population	No. of counties or sub-districts	No. of towns and villages
Taihoku province	299	1,009,180	9	39
Shinchiku ,,	291	720,605	8	42
Taichu ,,	475	1,125,535	11	57
Tainan	354	1,278,926	10	66
Takao ,,	371	694,401	7	43
Taito district	231	64,806	4	11
Karenko ,,	298	101,300	4	10
Boko ,,	8	65,754	2	5
Taihoku city	3	275,675	—	—
Keelung ,,	3	81,713	—	—
Shinchiku,,	2	51,920	—	—
Shoka ,,	1	64,991	—	—
Taichu ,,	4	49,790	—	—
Tainan ,,	3	106,242	—	—
Kagi ,,	3	66,853	—	—
Takao ,,	2	76,380	—	—
Byoto ,,	4	39,272	—	—

The Climate Being in the semi-tropical zone, the summer time is long and the winter is short. The highest temperature, however, is not very much higher than in Japan proper, but the weather is warmer during the winter time. Frost is very rare and water has been known to freeze over only twice since Taiwan came under Japanese rule. The island lies in the highway of typhoons, and is yearly visited by them, terrible damage being sometimes caused.

During a 37-year period ending in 1933, Formosa was hit by severe typhoons no less than 89 times ; of these, several occurred in the year 1914.

Typhoons originate generally in the offing northeast or east of Luzon Island of the Philippines, and cross the island or enter the Chinese mainland, passing the southern or northern extremity of the island. Taiwan forms a part of an earthquake zone connecting Kyushu, Okinawa Islands and the Philippines and naturally it is very often visited by seismic shocks. The number of earthquakes registered in the island or the neighbouring seas during 25 years ending 1933, was 8,118, which means 325 a year or nearly one every day.

Administrative System

When Taiwan came under Japan's rule in April, 1895, the Japanese Government established the Taiwan Affairs Bureau in June of that year and then in August of the same year the Taiwan Government-General Act was promulgated in connection with the introduction of military administration. This was replaced by the civil administration in March of the following year. The Taiwan Government-General came under the supervision of the Minister of Overseas Affairs with the establishment of the Ministry in June, 1929. The Governor-General is invested with authority to require military assistance from the commanders of the army and navy in the territory under his jurisdiction, when he deems it necessary to do so for the maintenance of peace and order in Taiwan. If the Governor-

Digitized by Google

General is either a soldier or a naval man, he is able simultaneously to assume the command of the Formosan Army. The Governor-General also is invested with authority to supervise officials under him, promote them in rank, retire them from service, or recommend them for honours through the Minister of Overseas Affairs and the Premier, and to suspend or cancel orders and administrative measures of provincial governors under him, when such are deemed damaging to public interest or overstepping the sphere of their authority. The Taiwan Government-General consists, besides the secretariat to the Governor-General, of five bureaux, that is, the Home Affairs Bureau, Educational Affairs Bureau, Financial Affairs Bureau, Colonial Development Bureau and Police Affairs Bureau. The chief of general affairs, or civil governor, directors of the five bureaux and many other officials are under the supervision of the Governor-General. There is an Advisory Council to the Governor-General, which serves as a very important organ for the administration of the island. Not only does it give advice to the Governor-General on laws or regulations but also on general important business. The members consist of Government-General officials and leading persons in private circles in the island. The provincial administration extends over 5 provinces, 3 districts, 7 cities and 45 counties. There are the same number of provincial governors, district superintendents, city administrators and county chiefs, all under the Government-General.

Aboriginal Administration

The Taiwan aborigines are the oldest inhabitants of the island and are classified into semi-civilized aborigines and savage head-hunters. The former have now settled down as ordinary peaceful citizens and differ nothing in culture and general status from the natives who belong to the Han (Chinese) race. The head-hunters, on the other hand, live in mountainous districts and still adhere to their traditional habits and manners, their culture being very low. The Taiwan Government-General is concerned in its aboriginal administration mostly with these savage tribes. These savages lead a very primitive life, their dwelling-places being so difficult of access, and they still deter other tribes from settling near them by their traditional custom of head-hunting. Since Japan's occupation of Taiwan great efforts have been directed by the authorities to their subjugation and cultural improvement, and at the present time head-hunting is rapidly becoming extinct, and these savages are entering the first stage of civilized life. Some of them living along the mountain zone in west Taiwan, and those living on the sea coast in east Taiwan, pay taxes. These aborigines have a close resemblance to the Negritoes in the South Sea islands and are supposed by anthropologists to be of a Malay-origin. They may be classified into seven tribes: Taiyal, Saiset, Bunun, Tsuwo, Paiwan, Ami and Yami, and are entirely different in countenance, physical build, language and habits from the Han race who came over from continental China. These savages are distinguished by their extreme hatred of other tribes, and have a habit of combining together in an offensive and defensive alliance against any enemy. The number of these savages at the end of 1933 was 146,924, of whom 73,756 were male and 73,168 female. They lived in 24,480 houses in 595 villages. Their population in 1932 and 1933 was:

Digitized by Google

Tribes	1933	1932	Increase
Taiyal	34,333	34,005	328
Saiset	1,417	1,394	23
Tsuwo	2,367	2,161	206
Bunun	18,081	17,898	183
Paiwan	42,263	41,989	274
Ami	46,300	45,120	1,180
Yami	1,702	1,702	same
Others	461	34	427
Total	146,924	144,303	in. 2,621

The Four Tribes The savages of the Taiyal and Bunun tribes are known as the most ferocious of all. Occasionally they quarrel with and even kill their own comrades. The Tsuwo tribe abolished the custom of head-hunting many years ago. The Saiset tribesmen are the gentlest of all, and are quickly losing their savage proclivities. The Japanese authorities have cudgelled their brains how to bring these wild people under control. When Holland occupied the south of Taiwan and Spain the north, they tried to pacify them principally through the medium of religion and medicine. During the time when the Cheng family from south China ruled the island, force and conciliation were adopted in turn, but the results were not satisfactory. Conciliation has dominated Japan's policy toward these savages in the island since her occupation of Taiwan. When the campaigns against rebels came to an end in 1902, attention was given to the aboriginal control policy. Owing to the stubborn resistance offered by the savages, the Governor-General, General Viscount Samata Sakuma, drafted a five-year plan for dealing with the aborigines and established the campaign headquarters in the Government-General in 1909 to start the enterprise on an elaborate scale. The fundamental policy was based on conciliation, and training the savages to become law-abiding people on the one hand, and chastisement of the insubordinate on the other. The confiscation of their arms was one of the important tasks. All arms were given up to the Japanese authorities by the northern aborigines in 1914. This completed the task of aboriginal pacification in January, 1915. Occasional raids on police stations and head-hunting of innocent people were committed after that, owing to the instigation of malcontents. The worst outbreak that took place was the Musha Incident in October, 1930, which culminated in the sending of troops. Many of them are engaged in farm work and pay taxes. Some of them receive special education. Policemen are stationed at various points of vantage in the savage districts and peace maintenance, job-finding, education, medical care, traffic, public works and sundry other affairs are being looked after by them. Since the occupation of Taiwan to the end of 1933 rifles confiscated numbered 29,772, of which 14,286 rifles were confiscated in 1914, when the five-year campaign plan came to an end. Spades replaced rifles. During the 38 years which ended in 1933, 7,081 people lost their lives at the hands of savages and the largest number of them in a single year was 761 in 1912. In 1930, 158 deaths were reported. This is due to the Musha Incident. Of the total of 7,081 victims during those 38 years, those of police, Japanese and native, numbered 2,667 and those of civilians 4,414. During the same period 4,099 were wounded in connection with the campaign against savages. A change, however, is beginning to be made in the lives of these people in recent years. They are emerging from their primitive condition into an economic existence. They are glad to work on paddy fields and take up other sorts of labour. They are now pretty well initiated into money-saving habits. Their postal savings deposits

Digitized by Google

at the end of 1933 amounted to ¥345,615, representing 19,016 depositors, the highest single deposit being ¥5,230 and the average deposit ¥18.17 per head. At present the aboriginal administration consists mainly in finding work for the aborigines and giving them education.

Occupations of Aborigines The work in which the aborigines are mainly engaged is cultivation of paddy fields, stock-raising, sericulture and other kinds of farming. They raised 23,357 koku of unhulled rice in 1933 (one koku being 5.1116 bushels), showing a gain of 1,990 koku over 1932. The authorities also encourage stock-raising. At the end of 1933 the natives had 32,871 pigs, 6,346 buffaloes, 3,373 cattle, and 3,601 sheep. The value of their cocoon crop for 1933 totalled ¥38,511. They also raised sundry other farm products valued at ¥57,860 for the same year. Education is gradually spreading among the aborigines. At the end of 1933 there were 7,414 aboriginal children attending 182 schools maintained at the expense of the Government-General specially for these tribes. In addition, the number of the people attending other kinds of school was 8,628 at the end of 1933. The Government-General authorities also are directing their energy to cultural enterprises for them. The aborigines have their own social organizations, such as the chiefs' societies, women's societies, young men's associations, school children's patron societies, and others. Members of these societies numbered 38,868. Also there were about 32,246 at the end of 1933, who were able to understand Japanese fairly well. Superstition is being gradually eradicated from among the aborigines, as medical attention is being increasingly given them. Free dispensaries provided exclusively for them numbered 224 at the end of 1933. The Government-General established 101 "exchange" houses for them to sell their products. The sales at these houses at the end of 1933 totalled ¥475,144.

Police and Judicature

The Police The Taiwan police consist of men appointed from among Japanese, natives and semi-civilized aborigines. Their services are divided into the ordinary service and aboriginal police service. The police in aboriginal districts are reenforced by police assistants appointed mostly from among natives. These are features of the police services of Taiwan. What is known as the tithing system of Taiwan provides a feature of peace preservation in the island. This system is of Chinese origin and was first adopted as an auxiliary to the police system in 1898. Owing to the satisfactory results attained, it also was extended to the lower grades of the administration in 1909. One tithing group consists of 100 houses and it looks after the peace of the group. In case these groups organize an association, the matter has to be sanctioned by provincial governors or district superintendents. Each group has its chief, who is elected and sanctioned by governor or superintendent. His duty is to maintain peace and order in his tithing district. Members of groups consist of men ranging from 17 to 50 years old and must be of good character. They offer their services free. The number of groups involved in the tithing system of Taiwan was 5,360 at the end of 1933. Many pirates infest the coast of Taiwan, mostly coming from south China. They attack junks during the summer time. The police on duty against these sea raiders are attached to provincial or district governments.

Digitized by Google

Judicature The judicature of Taiwan consists of two grades of courts, viz., the supreme court and three district courts, the latter having four branches in all—all under control of the Governor-General. The functions of the various courts are practically the same as those of the courts in Japan proper.

Religion and Education

Religion There are 24 Shinto shrines in Taiwan. The Taiwan Shrine is a first-class Government shrine and is the central shrine of worship for the Japanese people in the island. It is located in a suburb of Taihoku, the capital of the island, and is dedicated to Okuninushi, Oanamuchi and Sukunahikona, all legendary leaders of the early Japanese race, and to His Imperial Highness General Prince Yoshihisa Kitashirakawa, who died in the island when commanding the Japanese expeditionary force in Taiwan during the Sino-Japanese War. Shintoism, Buddhism and Christianity have been propagated by the Japanese since 1895. Confucianism is observed among the natives and Chinese people in the island.

Education The continuous efforts of the Government-General have been rewarded to such an extent that the natives have been receiving education since 1922 together with Japanese in the classes of middle-school grade and in higher institutions, although the elementary education is still given both in the vernacular and Japanese languages. Besides numerous elementary schools, Taiwan had at the end of April, 1934, 10 middle schools, 13 girls' schools, 5 special schools of middle school grade, 4 normal schools, 4 colleges and 1 Imperial University. The Taihoku Imperial University was founded in March, 1928. It consists of two departments, one literature and politics and the other physics and agriculture. The educational expenses for the last five years are:

	Total amount	State expenses	Provinces and districts	Cities, towns and villages
		(In ¥1,000)		
1930	16,916	5,638	7,707	3,570
1931	17,074	5,428	7,709	3,936
1932	16,289	4,820	7,842	3,627
1933	16,723	4,895	7,842	3,985
1934	18,026	5,042	8,391	4,593
Average	17,006	5,164	7,898	3,942

Agriculture

Agriculture is the most important industry of Taiwan. Since the island came under Japan's control, it has made a rapid development and the total farm production in 1933 was warth ¥238,000,000, composing about 50 per cent. of all the industrial production of the island. The area under cultivation in 1900 was 363,290 ko (one ko being 2.377 acres or 2,934 tsubo). It increased to 845,479 ko at the end of March, 1933, more than double that of 31 years ago. The cultivated land is more than 20 per cent. of the island's total area. The area of cultivated land since 1900 has been as follows:

Year	Paddy fields	Dry land	Total
	(In 1,000 ko)		
1900	211	151	363
1908	328	345	673
1912	346	364	710
1917	330	412	742
1922	376	397	773
1927	399	422	821

Digitized by Google

Year	Paddy fields (In 1,000 ko)	Dry land	Total
1928	403	425	829
1929	406	423	829
1930	408	428	836
1931	411	424	835
1932	439	400	839
1933	482	362	845

People engaged in agriculture are about 52 per cent. of the total population. At the end of 1933 their number was 2,638,142, of whom tenant-farmers were 998,917, landed farmers 839,181, and landed tenant-farmers 800,044.

Rice Crops The climate is very well suited to rice cultivation especially in the western district, where crops are harvested twice a year. The production in 1933 was about 8,300,000 koku with a value of over ¥120,000,000. Rice forms the chief of the three most important farm products of Taiwan, that is, rice, sugar cane and potatoes. Rice known as Hōrai rice is grown heavily in recent years. Its plantation area for 1933 totalled 240,000 ko and the crop amounted to 3,400,000 koku for two crops a year. The plantation areas and rice crops since 1900 follow:

	Plantation areas (In ko)	Crops (In koku)
1900	360,922	2,052,970
1908	486,274	4,512,143
1912	495,128	4,046,611
1917	480,642	4,833,813
1922	527,096	5,445,814
1927	603,153	6,898,672
1928	603,058	6,795,005
1929	579,274	6,480,762
1930	633,444	7,370,516
1931	653,380	7,479,846
1932	684,928	8,949,216
1933	696,423	8,361,839

Sweet Potatoes Sweet potatoes also are extensively produced almost everywhere and all through the year in the island. The chief producing centres are Tainan, Taichu and Takao provinces. Potatoes serve as fodder for cattle besides being used as ordinary foodstuff. Dried potatoes are shipped to Japan as material for producing alcohol and starch. The export value of dried potatoes for 1931 totalled 43,571,775 kin (one kin being 1.3 pounds), worth ¥748,961. The crop of sweet potatoes for 1902 amounted to 501,160,292 kin and the amount has been increasing yearly since. The 1933 crop totalled 2,355,780,992 kin. The plantation area of 63,147 ko for 1902 increased to 138,060 for 1933.

Tea Tea is one of the principal exports of Taiwan. The export value totals about ¥9,000,000. The tea production amounted to 20,808,765 kin (in plantation area of 28,308 ko) for 1902 and that for 1933 amounted to 15,544,877 kin (in the area of 45,298 ko). Tea plantation was introduced there by immigrants from China. In 1868 some amount of tea roughly made in Taiwan was exported to Amoy, where it was refined, but later the Taiwan producers, bringing tea operators from Amoy and Foochow, began to export refined tea, and in 1869 as much as 280,000 pounds of refined tea were exported to New York. This was the first export of Taiwan tea to America. Then tea production developed considerably year after year. Export tea is classified into four varieties, viz., Oolong, Pouchong, green and black. Oolong and Pouchong teas are most abundantly produced; the former, appreciated by Americans, and the latter, preferred by the people of the South Sea Islands, is exported to Java and Siam. Black tea is extending its markets, and, although not as good as Ceylon tea, it is better in quality than Japanese black tea.

Other Products Other agricultural products are peanuts, beans, wheat, sesame, longan, (otherwise known as "dragon's eye") and vegetables. The yielding areas and production of these farm products for 1933, as compared with those for 1900, follow:

Digitized by Google

	Yielding area (In ko)		Production (In koku)	
	1900	1933	1900	1933
Peanuts	11,958	30,724	120,838	475,512
Beans	11,365	19,130	50,281	73,313
Barley	1,479	539	11,460	3,689
Wheat	1,857	667	11,282	5,283
Sesame seeds	6,889	3,900	36,279	11,550
Jute	1,155	3,005	1,481,548 (kin)	8,794,988 (kin)
Hemp	1,654	1,295	1,022,063 ,,	1,424,787 ,,
Tobacco	240	801	363,900 (kg)	1,535,688 (kg)
Oranges	317 (1905)	4,057	2,025,965 (kin) (1909)	49,280,291 (kin)
Pineapples	—	6,626	—	86,800,448
Longan	—	504,025 (trees)	—	8,282,393 (kin)
Vegetables	—	—	—	¥10,000,000

The export of pineapples for 1933 totalled ¥159,444 and that of canned pineapples ¥5,149,572.

Bananas are Taiwan's representative fruits. They are planted everywhere in the island, but are produced most heavily in Taichu province, where 52 per cent. of the total production is got. They occupy the third position in the export list of the island, the first being rice and the second sugar. Bananas exported during 1933 totalled 2,813,558 baskets, worth ¥11,894,123. In 1909 the plantation acreage was 560 ko with a crop of 10,536,062 kin, which increased to 19,228 ko with a crop of 292,555,667 kin.

Live-stock The live-stock raising industry in Taiwan is flourishing. The number of cattle at the end of 1933 was 366,270, of which buffaloes numbered 302,249. Buffaloes play the most important rôle in agriculture. Hog-raising industry is widely maintained and hogs are kept by almost all native farmers. Their number at the end of 1933 was 1,806,489, having increased three-and-half times since the cession of the island to Japan. Poultry consists of chickens and geese, their total number at the end of 1933 being 7,573,504. It was in 1912 that sericulture was started in the island. Before that year no sericulture existed there. It took nearly 10 years before native farmers appreciated it as a side-line. This industry is becoming important among farmers. In the first year the cocoon crop amounted to only 84 koku and it increased to 1,990 koku in 1933. One of the unique features of sericulture in Taiwan is that silkworms can be raised at any time of the year, since even during the winter-time mulberry leaves are grown. Moreover, no insect ravage is experienced in the island. The cost of production is scarcely half of that in Japan.

Agricultural Equipment The Taiwan Government-General has taken every possible measure to encourage the rice cultivation and improve the quality of rice. "Hōrai rice" is a Japanese variety, and after many years' experiment the island succeeded in raising rice of good quality. The inspection of rice has been made under control of the Governor-General since July, 1926. Silkworms are raised and distributed by the Sericultural Experimental Station of the Colonial Development Bureau in the Government-General. The Government-General also is adopting all possible steps for improvement of tea cultivation and for this purpose is training tea-raising experts at its Tea Institute. The Pineapple Experimental Station is maintained under control of the Government-General for promotion of this indus-

Digitized by Google

try. Agricultural warehouses, numbering 36, are doing business upon Government subsidy. The immigration of Japanese into Taiwan so far has failed to realize satisfactory results. Farm settlers from Japan proper numbered 3,526 at the end of 1933. They maintain an area of paddy fields covering 1,148 ko and farms covering 1,582 ko. Fundamental farm investigation is being constantly carried on by the authorities. The investigation involves that of land management, tenancy, farm economy, farm production, demand and supply of products and fertilizers, land utilization, farm labour, market prices of farm products, etc. Irrigation work also is pursued on an approved plan. The Landlord and Tenant-Farmers Harmonization Society was established in 1927 under government aid for the improvement of relations between landlords and tenants.

Sugar Industry

Taiwan is the centre of the sugar industry of Japan. The industry has existed since the coming of the Han race to the island and, when the Dutch occupied the island in 1624, sugar had already become one of the staple products of the island. It has maintained the topmost position of Taiwan's industries. At the time of Japan's occupation of Taiwan the annual output was only about 80,000,000 kin, one kin being 1.323 pounds. Japan proper consumed more than 300,000,000 kin of sugar, most of which had to be imported from abroad.

Dr. Nitobé's Plan Alive to this situation, the Taiwan Government-General concentrated its energy on the increased production of sugar by means of business improvement and expansion, and this has resulted in the present industrial prosperity. Not only has this prevented the import of foreign sugar, but it has contributed a great deal to the exploitation of natural resources and the financial and industrial development of the island. The late Dr. Inazo Nitobé was engaged by the Government-General to work out a sugar-industry development plan. He proposed several measures for industrial development, namely, the improvement of kinds of sugar cane and their cultivation, improvement of pressing and manufacturing methods, the application of artificial irrigation, increased land cultivation and expansion of sugar plantations, the establishment of sugar experimental stations, and the organization of sugar production guilds, as well as other measures. These formed the basic policy of the Taiwan sugar industry. The sugar encouragement regulations were issued in June, 1902. According to these regulations, the Government-General would give a subsidy to sugar-cane planters or sugar manufacturers for cane plantation, fertilizers, cultivation, irrigation, and manufacturing machines, or, if necessary, implements will be lent or given. The subsidies given in this connection up to the end of the fiscal year of 1931-32 totalled ₹12,908,698. The Government-General is adopting a policy of reducing the subsidy with the progress of the sugar industry. With the establishment of sugar mills the competition for the acquisition of canes became severe.

Upon Consolidated Basis In order to prevent evils arising out of this competition, the authorities issued regulations restricting the spheres of cane plantations in 1905. This caused sugar-makers to work on a consolidated basis yearly. As it was impossible for sugar manufacturers to get material from districts other than those designated for them by

Digitized by Google

regulations, the makers took great care of the planters working on their fields. Planters also were placed on a definite basis of economy by the regulations, because the canes raised by them could be sold to the mills to which they belonged. When the sugar policy was established, the Extraordinary Taiwan Sugar Affairs Bureau was organized, but it was later replaced by the Sugar Refinery Section of the Colonial Development Bureau. The Government-General first established the Young Cane Seed Experimental Station in Taichu province in 1913. Seeds raised there were distributed to intermediate experimental yards, where they are further grown. Manufacturing companies are bound by duty to distribute these seeds free to farmers within their plantations. Thus the improvement of canes was realized. Young plants distributed till the end of March, 1933, totalled 548,936,040.

The Sugar Experimental Station The Taiwan Government-General Sugar Experimental Station was reorganized and was founded in Tainan city in March, 1932, as the central organization for the promotion of sugar plantation. At first, the Hawaiian "rose bamboo" canes were adopted for the Taiwan sugar cultivation and canes of this kind occupied 96 per cent. of all grown in 1913. Due to lack of adequate measures to keep the quality unchanged, and also to the fact that these canes had little power of resistance against storms they finally deteriorated. Then they were replaced by Java canes. Irrigation is the most important item in a sugar plantation. At the end of March, 1932, the land under irrigation totalled 112,416 ko. The following are figures showing the area of sugar plantations and crop per ko since 1902:

Fiscal year	Plantation area (In ko)	Cane crop (In kin)	Crop per ko (In kin)
1902–03	16,526	683,157,902	41,338
1905–06	35,158	1,690,206,794	48,078
1908–09	39,035	2,219,471,541	56,858
1910–11	75,329	3,159,598,569	41,944
1914–15	85,150	3,933,805,780	46,199
1917–18	150,450	6,817,535,709	45,314
1919–20	108,376	4,382,506,262	40,438
1920–21	142,032	6,752,838,826	47,544
1921–22	123,233	7,793,688,518	63,243
1923–24	130,480	8,825,841,621	67,641
1925–26	123,426	8,615,430,295	69,802
1926–27	101,531	7,411,962,535	73,002
1927–28	108,318	9,697,644,651	89,529
1928–29	120,046	12,291,944,205	102,394
1929–30	109,397	11,618,358,936	106,204
1930–31	99,094	10,944,669,505	110,447
1931–32	109,496	13,415,197,477	122,518
1932–33	83,690	8,782,001,849	104,835

The Refining Industry

The sugar industry at the time of Japan's occupation of Taiwan was very primitive. Out of about 1,100 sugar mills, not a single mill had adopted the modern mechanical method of manufacturing, and all of them used animal power. Owing to insufficient pressing power, a large percentage of sugar-substance was wasted during the manufacturing process and, moreover, the product was inferior. By 1934 there were only 92 mills of this kind, as the majority of them were gradually eliminated. In these primitive mills two stone wheel cars or three metal wheel cars are employed for grinding by animal power. Improved mills use pressing machines and motors. Brown sugar is also manufactured. Such mills number only eight, with a total productive capacity of only 910 tons for 1934. The modernly-equipped mills have pressing capacity ranging from 300 to 3,000 tons a day and are able to produce in great quantity. The Taiwan Sugar Manufacturing Company founded in 1901 was the first of its kind. During the financial boom following the Russo-Japanese War many sugar-manufacturing concerns

Digitized by Google

were established, and Japan finally leaped into a prominent position among the world's sugar-producing countries. In 1933 there were 49 mills with the daily productive capacities of 28,150 British tons and 13,400 American tons. Most of them produce crude sugar known as centrifugals. Some of them turn out white sugar by a change of milling operation. Sugar-cane pressing capacity and production of white sugar follow:

Companies	Cane pressing capacity (In tons)		Production of white sugar 1929 (In kin)	1933 (In kin)	1934 (In kin)
Taiwan Sugar's Taihoku mill	Brit.	500	7,143,743	4,273,350	3,636,964

Total	,,	6,950	150,284,543	156,157,425	158,102,766
	Amer.	1,200			

No refined white sugar was produced from Taiwan crude sugar for 1934. Crystallized sugar is produced from the material of white sugar or refined sugar. It is manufactured at the Takao mill of the Ensuiko Sugar Manufacturing Company. The amount totalled 116,900 kin in 1926, but since 1927 the production has been suspended. Molasses is a by-product in making centrifugal sugar. This is used as material for making alcohol and also for fodder, fertilizer and other purposes. The 1934 output totalled 149,216,000 kin.

Summary Summarizing the status of the sugar industry, the cane-plantation area at the beginning of 1902 was 26,167 ko, and there was only one mechanically-operated mill with a daily capacity of 200 tons and capitalization of only ¥1,000,000. In 1927 such mills numbered 45 with a daily productive capacity of 39,414 American tons and total capitalization of ¥290,520,000, although this dropped to ¥245,776,600 in 1933, owing to mergers or readjustment of business. But the capacity increased to 44,928 American tons for 1934. The total production in 1902 was only 90,000,000 kin, but in 1927 it rose as high as 1,315,540,000 kin and further to 1,648,440,000 kin in 1932. It decreased to 1,078,310,000 in 1934 due to curtailment of production as agreed upon among sugar companies.

Companies	Head offices	Capital Subscribed (In ¥1,000)	Capital Paid-up (In ¥1,000)	No. of mills	Daily pressing capacity of canes (American tons)
Taiwan Sugar	Heito, Takao province	63,000	43,080	13	11,814
Shinko Sugar	Tairyo, Takao province	1,200	1,200	1	952

Production of sugar for the 1933-34 fiscal year follows:

Companies	Materials used (In kin)	Sugar production	Production of molasses
Taiwan Sugar	1,902,242,800	286,499,873	36,239,049
Shinko Sugar	88,929,120	12,468,702	2,578,276
Meiji Sugar	1,216,881,480	170,642,359	24,822,798
Dai Nippon Sugar	1,698,987,580	236,367,346	33,104,476
Ensuiko Sugar	1,202,857,600	163,570,965	22,766,558
Niitaka Sugar	363,556,680	50,547,100	7,658,746
Teikoku Sugar	584,462,960	81,494,653	13,306,232
Showa Sugar	217,401,060	30,276,718	4,505,477
Taito Sugar	114,066,690	16,409,280	2,598,111
Sango Sugar	75,308,930	9,061,556	2,044,218
Total	7,463,694,900	1,057,338,552	149,123,941
Improved mills	53,529,571	7,869,235	—
Primitive mills	132,920,527	13,178,332	—
Grand total	7,650,144,998	1,078,386,119	149,123,941

Sugar production in Taiwan since | 1905 has been as follows:

Year (Nov.-Oct.)	Mechanically-operated mills	Improved mills	Primitive mills	Total
		(In kin)		
1905	7,558,418	641,533	74,432,707	82,632,658
1908	28,650,648	21,548,814	59,002,565	109,201,527
1911	323,746,074	67,923,183	58,895,441	450,564,698
1913	105,047,715	7,266,608	6,834,921	119,149,244
1915	313,064,988	18,609,895	15,771,514	347,446,398
1917	681,942,099	44,267,832	37,280,842	763,490,273
1919	435,905,228	17,226,885	33,224,850	486,356,963
1921	401,948,211	8,695,462	10,579,932	421,223,605
1923	581,460,227	3,766,752	7,093,274	592,320,253
1925	778,774,392	8,040,111	12,418,544	799,233,047

1928	952,868,631	6,475,108	7,517,395	966,861,134
1929	1,296,552,378	9,627,008	9,368,152	1,315,547,538
1930	1,330,505,897	11,750,135	8,549,854	1,350,805,885
1931	1,311,805,429	9,534,794	7,458,389	1,328,798,612
1932	1,628,738,003	11,240,564	8,467,753	1,648,446,320
1933	1,028,051,024	16,784,410	11,356,898	1,056,192,332
1934	1,057,338,553	7,869,235	13,178,332	1,078,386,119

Forestry and Afforestation

The surface of Taiwan is covered by mountains to the extent of almost two-thirds of its entire area, and the island is rich in thick forests of immense depth. Forest protection and afforestation are done on an approved system by the Government-General. The great mountain ranges running north to south with numerous peaks provide vegetation peculiar to temperate as well as to tropical and sub-tropical regions. The most renowned of the natural forests of Taiwan are those on the mountains in the central ranges, from Taibysan in the south to the peninsula of Koshun; those on famous Mt. Arisan; those on Mt. Rokujodaisan in the north; and those on Mt. Seiran. Besides these, there are also extensive forests in the valleys of the River Dakusui and in some districts of Karenko. The total forest area in Taiwan is estimated approximately at 2,960,822 acres, 76,669 acres of government forests, 266,963 acres of protected forests, and 299,427 acres under afforestation. Building-timber, sleepers and other forest products turn-

Digitized by Google

ed out from the government forests amount to the annual value of ¥250,000. When the Portuguese first discovered the island, they were impressed with the immense expanse of forests and cried "Formosa!" signifying "beautiful." Reckless cutting of trees was done by Chinese immigrants and this, combined with the lack of adequate forest administration of the Manchu Dynasty, resulted in the devastation of forest districts. The Forest Bureau was established in 1915 and since then forest protection has been carried on in an approved manner by the Government-General.

Timber Industry The timber industry of the Arisan group is controlled by the Government-General. This famous mountain group is located east of Kagi in Tainan province and is on the Tropic of Cancer. It stands 9,240 feet high. It is covered with red cypress, Mongolian oak and hemlock. The former two kinds of wood are highly valued. There are many trees aged more than 3,000 years. Even the Imperial forest at Kiso in Nagano prefecture has few oaks of such great age. Timber used for the building of important shrines such as the Kashiwabara Shrine, dedicated to the memory of Jimmu Tenno, the first Emperor of Japan, the Imperial Mausolea at Momoyama for the Emperor Meiji and Empress Shoken, and the Meiji Shrine was grown on these mountains. The two great pillars constituting the torii of the Meiji Shrine are estimated to be 1,900 and 1,090 years old respectively. Both came from these mountains. The number of these valuable trees at the end of 1933 was 1,112,186. The Government-General spent ¥4,898,212 as initial outlay for the five years ending in 1912. This included ¥2,643,015 for railway construction, ¥1,200,000 as subsidy for Fujita Gumi, Osaka, which temporarily undertook the enterprise for the Government-General, ¥1,052,869 as general expenses, and ¥2,327 for other purposes. Lumbering work started in 1912. Sales of lumber amounted to ¥1,586,458 for 1929; ¥1,366,296 for 1930; ¥1,210,274 for 1931; ¥1,061,852 for 1932 and ¥1,139,310 for 1933. The total amount of timber on Mt. Arisan is estimated at 6,073,970 cubic metres which may be divided into 2,948,590 c. m. of coniferous trees and 3,125,380 c. m. of broad-leaved trees. The lumber industry of Mt. Arisan also is noteworthy. This mountain is not far from Toyohara in Taichu province. Pine and spruce as well as cypress, hemlock, oak and other trees are produced there. Due to its dangerous location in the so-called savage district, the lumber industry on the mountain was undeveloped before the campaign against the aborigines was completed. The lumber industry on Mt. Taihei near Rato town in Taihoku province is considered one of the most promising of all in the island. Until 1913 the mountain was not exploited, because it was a stronghold of the most savage aboriginal tribe. The quantity of timber on the mountain is estimated at 14,159,000 cubic metres, nearly four times that of Mt. Arisan. Work started in 1915 and has so far realized satisfactory results. Sales of lumber totalled ¥1,327,865 for 1929; ¥1,135,780 for 1930; ¥1,038,067 for 1931, ¥905,705 for 1932 and ¥1,024,507 for 1933.

How Disposed Taiwan wood is not only used for shrine and temple construction, but for building of warships and merchant-ships. Demand from naval arsenals and dockyards is yearly increasing. Taiwan wood is exported to Japan proper, Korea, China, British India, South Africa, Australia and other places. Sales to the market in the island, Japan

Aquatic Products

The seas about Taiwan are rich in various kinds of fish and shellfish, and the catches are especially abundant in spring and autumn. Fishing is to a great extent still conducted in a primitive manner. There are, however, now 25 fishing companies having their headquarters in the island with an aggregate capitalization of ¥5,217,000 and four having their headquarters in Japan proper with a total capitalization of ¥56,050,000. There were 88 fish markets in the island at the end of March, 1933, and the total fish sales there during the year ending March 31 amounted to ¥10,269,000 and showed an increase of ¥1,560,000. The Takao Fish Market led the list. The Taiwanese are a fish-eating people, but the annual catch is so great that a large quantity is exported to Japan proper and other countries. Taiwan's marine product trade for 1933 amounted to ¥12,196,568, exclusive of salt, showing an increase of ¥507,943 over the previous year. Trade figures include exports abroad totalling ¥1,303,368, imports from abroad totalling ¥339,292, exports to Japan proper totalling ¥2,588,266 and imports from these districts totalling ¥7,965,642. The making of dried bonito is the largest marine products industry. The annual output of dried and canned marine products is worth about ¥1,900,000, half of which goes to the dried bonito production. The marine production of Taiwan follows :

	Catches	Manufacturing	Cultivated fish production	Total
		(In yen)		
1921	5,943,217	1,665,125	2,153,856	9,762,198

Mineral Products

The principal mineral products of Taiwan are gold, silver, placer-gold, quicksilver, copper, iron, lead, zinc, coal, petroleum, sulphur and phosphorus. The mine-lots at the end of March, 1933, numbered 593 with a total area of 173,596,842 tsubo, one tsubo being six feet square. Mines in operation numbered 168 covering an area of 78,474,656 tsubo. Of these 168 mines, 2 were gold mines, one gold-copper mine, 10 placer-gold mines, 132 coal mines, 11 sulphur mines and 13 oil fields. The mineral production for 1932 totalled ¥13,950,889, showing an increase of ¥613,099 over 1931. The mineral production in 1897 and during the last five years follows :

	1897	1928	1929	1930	1931	1932
			(In yen)			
Gold	—	377,362	625,422	636,486	722,733	1,681,592
Gold-copper ores	—	1,489,899	3,136,877	3,457,187	3,027,792	3,709,157

Carbon black	—	—	—	—	43,552	205,527
Total	111,883	16,513,801	15,090,613	15,141,198	13,337,790	13,950,888

The Government-General conducted a mineral and geological investigation for eight years over the island following the introduction of civil administration in 1896. As a result, oil distribution was found almost all over the island. Subsidies were granted to those who had proper equipment for boring for oil to a depth of more than 2,000 feet. The subsidy was given from 1901 to 1924. It was then suspended, owing to financial reasons, but was resumed in 1930. Metal ores are found exclusively in the extreme north and the eastern district, coal in the northern and central parts and oil all over the island, especially in the central and southern districts. The mineral production in 1897 was only ¥112,000, but in 1907 it increased to ¥2,255,000, and in 1933 to as much as ¥13,950,888. Of this more than 50 per cent. was coal, gold-copper ores 23 per cent. ; gasolene 13 per cent.; gold 5 per cent.; other minerals in smaller amounts in the following order : petroleum ; copper, gold ores, sulphur, silver, placer-gold and phosphorous ores.

Gold and Silver Placer-gold was first discovered by Japanese invaders in Taiwan over 400 years ago, when Japanese pirates infested the neighbouring coasts of China. It was then got at Takkiri Gorge in Karenko district. In later years placer-gold was found in several localities, but at present the mining is conducted along the Keelung and other rivers. When the mining was most prosperous in 1903, the annual output reached 161 kan, one kan being 8.267 lb., valued at ¥610,000, but since then the industry has been sinking. The 1931 output was only 3.165 kan. A gold vein was first discovered at Mt. Kubu in 1893. In the following year gold deposits were found at Kinkwaseki and in

Digitized by Google

1891 another vein was discovered at Butanko. The gold mining interests at Butanko and Kinkwaseki was merged in 1913. The mining operation is done at Zuiho and Kinkwaseki. The Kinkwaseki mine is located about 10 miles east of Keelung. It is managed and operated by the Tanaka Mining Company, Ltd. The mining area at the end of 1931 was 4,053,000 tsubo. It has its own refinery.

Production at the mine for three years ending 1932 follows:

		1930	1931	1932
Gold:	Output	233,681 grammes	226,534	208,844
	Value	¥310,717	301,043	433,241
Silver:	Output	383,700 grammes	96,199	426,639
	Value	¥8,591	7,961	11,858
Gold-copper ores:	Output	132,200 metric tons	95,476	108,809
	Value	¥3,457,187	3,027,792	3,709,157
Gold ores:	Output	1,249 metric tons	1,345	1,157
	Value	¥81,401	70,750	78,982
Precipitated copper:	Output	721,680 kilogrammes	1,383,709	1,620,124
	Value	¥154,799	174,419	294,388
Total Value		¥4,013,107	¥3,582,945	¥4,527,626

Fujita Gumi, Osaka, first operated the Zuiho Mine in 1898, but the enterprise was transferred to the Taiyo Mining Company in 1920. Business has failed to realize satisfactory results. Its gold and silver output for three years follows:

		1930	1931	1932
Gold:	Output	281,828 grammes	315,518	569,749
	Value	¥325,769	420,690	1,238,051
Silver:	Output	87,911 grammes	119,235	180,968
	Value	¥2,209	2,062	4,774
Total value		¥327,978	422,753	1,242,825

Other Minerals The output of sulphur in Taiwan for 1932 amounted to ¥37,148 and that of quicksilver for the first six months of 1931 amounted to ¥2,488, but since then the mining operation has been at a standstill. The coal output for 1932 amounted to 1,354,995 tons, worth ¥6,571,195, showing a drop of ¥593,403 from 1931.

Oil Oil in Taiwan was discovered by a Chinese about 80 years ago at Shukotan, near the Koryu valley, over an area covering 599,670 tsubo. Since 1905, 71 oil wells have been sunk. Well No. 18 is the best of all. From 1913 to 1925 the oil output from this well totalled 53,205 koku, by the Nippon Sekiyu Kaisha (Japan Oil Company, Ltd.). Owing, however, to the concentration of energy on the exploitation of the Kinsui Oil Field by the company, the output has gone off from the daily output of 300 koku. Lamp oil, gasoline, light oil and paraffin are manufactured from crude oil obtained here. The oil refinery is in Byoritsu.

The production from the crude oil is gasoline, 5 per cent., lamp oil 85 per cent., heavy oil 8 per cent. and wax.

The Kinsui oil field is the most important one in Taiwan. It is operated by the Japan Oil Company. A government subsidy was paid to exploit wells No. 1 to No. 5. It took eleven years for well No. 5 to realize satisfactory results. Well No. 10 produced an enormous out-

Digitized by Google

put of 30,000,000 cubic feet a day in March, 1930, and a gasolene plant was installed there in November of the same year. When the capacity of the gasolene plants is fully developed, the daily output of gasolene will be 1,000 koku.

Other Industries

Prior to the World War, industries other than sugar and tea developed very little in the island. Since the War, however, chemical, spinning, machinery and other miscellaneous industries have developed to a considerable extent. The more important of them for 1933 follow:

	Yen
Metal Industry:	
Tin plates	1,469,000
Gold and silver works	1,688,000
Machinery Industry:	
Sugar refining machinery	3,464,000
Agricultural implements	1,123,000
Ceramics Industry:	
Tiles	2,172,000
Cement	3,870,000
Chemical Industry:	
Alcohol	4,277,000
Mineral oil and wax	1,282,000
Vegetable oils	1,211,000
Refined camphor	1,296,000
Mixed fertilizers	3,689,000
Food Stuff Industry:	
Soy sauce	1,843,000
Flour	2,057,000
Sugar	127,119,000
Confectioneries	4,658,000
Canned pineapples	6,173,000
Macaroni	2,635,000
Ice	1,261,000
Polished rice	1,038,000
Miscellaneous Industries:	
Woodworking	4,000,000
Hats	4,552,000
Others and total	207,700,000

Of the total 1932 industrial production amounting to ¥207,700,000, the foodstuff industry totalled ¥154,000,000, or 74 per cent., the chemical industry ¥18,000,000, or 9 per cent., other industries ¥15,000,000, or 7 per cent., the ceramic industry ¥8,000,000, the mechanical and tool industry ¥5,400,000, the metal industry ¥4,000,000, and the spinning industry ¥2,700,000.

Overseas Trade The overseas trade of Taiwan, although it has experienced temporary set-backs from time to time, has made remarkable progress in recent years. The bulk of overseas trade is, however, with Japan proper, the rest being chiefly done with China, the United States, the Straits Settlements, the Dutch East Indies, the United Kingdom, Germany, British India, the Kwantung Leased Territory and Hongkong. The trade is carried on principally through the four large ports of Keelung, Tamsui, Anping and Takao. As Keelung is the most important port of trade in the north, so is Takao in the south. The trade volume for 1898 amounted to ¥30,000,000 which increased to ¥50,000,000 in 1906, and, owing to the phenomenal growth of the sugar industry and import of sugar milling machinery, the amount went up to more than ¥100,000,000 in 1910. In 1917 the amount recorded a further gain to ¥234,000,000, due to active trade in sugar, alcohol and rice and heavy transit trade with China. An all-time record of ¥476,803,950 was made in the trade volume for 1929, but the amount declined sharply the following year, because of the universal economic depression, and in 1931 it went off still more though it somewhat regained in 1932. Taiwan's overseas trade since 1897 has been as follows:

Of the above, tea deserves special mention. In 1931 production of unrefined tea amounted to 16,037,678 kin, worth ¥3,228,822, and that of refined tea 14,959,584 kin, worth ¥8,323,837. Refined tea included ¥2,845,069 of Oolong tea, ¥5,071,499 of Pouchong tea, ¥392,165 of black tea, and ¥15,104 of green tea. The tea is almost exclusively produced in Taihoku and Shinchiku provinces. Oolong tea is appreciated by Britishers and Americans. The largest amount goes to the United States and the second largest amount to Great Britain. Pouchong tea is shipped to the South Sea islands. Tea exports for 1933 follow :

Finance

The Bank of Taiwan is invested with authority to issue notes. This bank was founded in September, 1899, replacing the Taiwan Agency of the Bank of Japan. The bank was capitalized at ¥5,000,000 when it was founded. After 1920 its capitalization was increased to ¥60,000,000, but in September, 1925, it was cut to ¥45,000,000 and further to ¥15,000,000 in November, 1927, due to its readjustment following the great financial panic of the spring of 1927. The head office is in Taihoku and it has 31 branches and one agency in Japan and abroad. The Japan Hypothec Bank maintains its real estate business in Taiwan and the outstanding balance of its loan in the island at the end of 1933 amounted to ¥79,890,000. The aggregate capitalization of banks having their head offices in the island at the end of 1933 was ¥28,300,000, of which ¥20,670,000 was paid up. The balance of deposits at the end of 1933 was ¥132,260,000, of which savings deposits totalled ¥9,410,000, and the outstanding balance of loans totalled ¥246,690,000. Exchange deals for the 1933-34 fiscal year totalled ¥843,940,000 for income and ¥779,420,000 for payment. The balance of note issue of the Bank of Taiwan at the end of 1933 totalled

Digitized by Google

¥48,990,000, of which excess issue was ¥5,220,000.

Government-General Finance The finance of the Taiwan Government-General has become independent from subsidization by the general accounts of the Central Government since the 1905-06 fiscal year, owing to favourable income following the Russo-Japanese War. In 1897 the revenue was about 11 million yen. In 1907, 10 years after the establishment of special accounts in Taiwan, the revenue increased to three times that amount; in 1917, after 10 more years, to six times; in 1927, to 12 times; and in 1929 to 13 times the first figure. Revenue and expenditure follow:

	Revenue (In yen)	Expenditure
1897	11,283,265	10,487,610
1907	35,295,772	27,709,751
1917	65,425,496	46,166,558
1927	138,626,830	101,533,285
1929	150,420,607	122,295,326
1930	129,757,760	109,970,881
1931	115,972,147	99,060,013
1932	120,303,279	97,240,295
1933	130,812,152	102,220,615
1934 (budget)	110,821,261	110,821,261

Bonds Expenses required for enterprises such as the railway construction, land investigation, Keelung harbour construction, building of government offices, river work, Takao harbour construction, and purchase of private railways were raised by bonds. The outstanding balance of bonds in 1900 was ¥3,200,000, which increased to ¥34,465,399 in 1910, ¥94,213,038 in 1925, ¥106,946,733 in 1927 and ¥126,331,288 at the end of 1933.

Monopolies

The products of Taiwan, opium, salt, camphor, tobacco, and saké are placed under monopoly of the Taiwan Government-General.

Opium The Taiwan Chinese, mostly natives, were addicted to opium smoking when Japan assumed ownership of the island. It was found impossible to eradicate the habit at once, and in order to limit the use of the drug a government monopoly, controlling the manufacture, sale and retail distribution of opium, was established. Smokers are registered and have to obtain a licence to buy the drug. In this way and also through education of the rising generation the vice is being gradually eliminated. The total names registered in September, 1900, reached 169,064, of those to whom the licences were granted. The number of licenced smokers at the end of 1932 had decreased to 19,532, of whom 16,532 were males and 3,254 females. The Chinese people who smoke opium on licence at the end of 1932 numbered 191, of whom 174 were males. Japan, in conformity with the spirit of the League of Nations' International Opium Treaty, has been endeavouring to stamp out the bad habit of opium smoking and has realized satisfactory results so far.

There are two forms of opium, viz., "treacle-opium" for smoking, and powder; the latter is sold only for medicinal purposes. Raw material obtained from poppies is imported from British India, Persia and Turkey. The Persian products are widely used now. Sales to licensed smokers are made by the Monopoly Bureau to specially designated wholesalers through provincial and district governments. The sales price to these wholesalers is ¥1.61 per 15 grammes, that from wholesalers to retailers is ¥1.63 and that from retailers to consumers is ¥1.77. 15 grammes is the maximum amount that one smoker is permitted to buy at one time: this must last him for three days.

Sales have been decreasing yearly as follows:

Digitized by Google

	Quantity	Total sales
1902	130,723,125 grammes	¥3,008,386
1906	87,690,750	4,359,497
1910	80,320,875	4,844,534
1913	86,326,500	5,289,495
1918	76,326,750	6,650,764
1922	51,558,000	5,449,345
1930	88,095,125	4,010,655
1931	31,585,625	3,320,071
1932	26,136,075	2,819,388
1933	21,553,200	2,350,363

Salt This was monopolized in 1899 by the Government-General. In former days the fields were only 197 ha. producing about 10,800,000 kg. a year, but in 1933 they were increased to 1,878 ha., producing 191,000,000 kg. Sales of salt in 1905 were only ¥557,876, which increased to ¥2,718,840 for 1933.

Camphor Taiwan maintains a monopoly on the cutting, distillation and selling of camphor. The island is rich in camphor trees, particularly in what are known as the "savage districts", and is the greatest camphor-producing country in the world. For many years after it came into Japan's possession, the production of camphor was a free industry, but the necessity of improving the quality compelled the Government-General to assume monopoly in 1899. The camphor production amounts to about 3,000,000 kilogrammes a year, which represents 70 per cent. of the world's production. The manufacturing of camphor and camphor oil used to be entrusted to the Taiwan Seino Kaisha, but in July, 1934, the Government-General purchased it and now places the production and sales of their articles under its direct control. The improved B-quality camphor is sold by the monopoly bureau as material for refined camphor or celluloid. Refined oil is directly sold by the bureau in Taiwan, but in Japan it is sold to industrialists through the Japanese Government Monopoly Bureau. It is exported abroad on consignment mostly to the United States, Great Britain and other countries. The United States is the largest consumer. The sales price of improved B-quality for 1932 was ¥145.50 per kilogramme f.o.b. Taihoku and ¥148 f.o.b. Kobé. By-products are widely used for making insecticides. As the demand for camphor increases yearly, the Taiwan Monopoly Bureau is carrying out a camphor-tree plantation plan covering an area of 135,246 acres, for the production from natural-grown trees is expected shortly to become too small to meet the future demand. The annual proceeds from the camphor monopoly average nearly ¥12,000,000. The United States used to buy about ¥2,400,000 of camphor a year, but the export amount has decreased somewhat in recent years, owing to the invention of synthetic camphor.

Tobacco The tobacco monopoly in Taiwan dates from 1905. At the beginning of the monopoly the quality of tobacco grown in Taiwan was so poor that the leaves had to be imported from China. Efforts were made by the authorities for the improvement of native-grown leaves. Now tobacco cultivated in Taiwan is not inferior to Chinese tobacco. In addition to the Chinese variety, a successful experiment has been made in the cultivation of an American yellow variety for cigarettes, and another for cigars. The area of tobacco plantation in Taiwan was about 776 ha. in 1933 and the crop of leaves about 1,535,689 kg. The proceeds of tobacco monopoly for the fiscal year 1906-07 totalled ¥1,492,284, which increased to ¥11,531,850 for the year 1921-22, ¥16,275,916 for the year 1929-30, but declined to ¥14,465,962 for the year 1931-32, advancing to ¥15,247,299 for the 1932-33 year.

Saké and other drinks These have

Digitized by Google

been placed under monopoly since 1922. The sales of saké and other alcoholic drinks under the monopoly are not restricted to those made in Taiwan only, but include all drinks imported from Japan proper and other countries. Drinks now brewed in Taiwan are of 31 kinds besides saké. The saké monopoly furnishes a large source of revenue for the Government-General and brings in about ¥5,000,000 a year, of which the tax on alcohol totals ¥2,000,000 and that on alcoholic drinks ¥3,000,000.

Railways

At the time of Japan's occupation of Taiwan there was a 62-mile railway between Keelung and Shinchiku. Railway construction was undertaken by the Government-General subsequently and now the total mileage is 881 km. The railway receipts are as follows :

Fiscal year	Passenger fares	Freight receipts (In ¥1,000)	Others	Total	Indices
1900-01	214	127	1	342	100
1906-07	1,062	1,138	9	2,209	648
1916-17	2,575	3,544	44	6,163	1,455
1922-23	5,616	6,541	—	12,157	3,540
1926-27	7,488	9,711	—	17,199	5,008
1927-28	8,002	10,644	—	18,646	5,428
1928-29	8,277	11,420	—	19,697	5,735
1929-30	8,349	11,915	—	20,264	5,900
1930-31	7,720	11,391	—	19,111	5,564
1931-32	6,897	11,367	—	18,264	5,317

Electricity

The Taiwan Electric Power Company, Ltd., was established in April, 1919, under ordinance of the Taiwan Government-General. The Government-General appraised all of its electric assets at ¥12,000,000 and offered them to the company. The Government-General owns the company's shares to that amount, being the largest shareholder. The company started a gigantic power-generating undertaking, utilizing the water of Lake Jitsugetsutan, in August of the same year, but, owing to the subsequent financial depression, the work was suspended. In 1929 the resumption of work was decided on and the necessary amount, $22,800,000 (¥45,737,211) was raised in America in July, 1931, on Government guarantee. Work was actually resumed in October of the same year on a three-year plan. Taiwan's electric enterprises at the end of 1933, are summarized as follows:

Companies	Capitalization	Lamps fitted	Powers supplied kw.	Fans fitted
Taiwan Electric Power	¥34,495,000	578,657	19,301	27,857
Taiwan Electric Light	1,500,000	67,418	1,903	1,823
Taiwan Godo Electric	2,000,000	26,297	564	369
Karenko Electric	1,240,000	11,125	445	209
Koshun Electric	100,000	1,241	—	—
Nansho Electric	8,500	154	—	—
Total	39,343,500	684,892	22,213	30,258

Principal Cities

Taihoku Taihoku is the capital city of Taiwan. It is situated on the Tamsui River, near the northern extremity of the island. Formerly it consisted of three districts, Jonai, Daitotei and Manka, but with the introduction of the municipal system in 1920, all the surrounding villages were included in the greater Taihoku, and at present the city covers an area of about 15 square miles, embracing a population of 196,000, including 54,000 Japanese, 128,000 natives and 13,000 foreigners, mostly Chinese residents. In Jonai are found the important public buildings, such as the official residence of the Governor-General, and many governmental buildings. Most of the Japanese residents live in this district. Daitotei is the commercial centre. It is inhabited by more than 63,000 people and is renowned for its tea trade. Manka is situated close by the Tamsui River, west of Jonai. This district was formerly the most flourishing part of the city. During the Manchu Dynasty its commercial supremacy was transferred to Daitotei. This district is populated by 37,000 inhabitants. There are many places of interest in and around Taihoku, of which the more famous are:

TAIWAN SHRINE This shrine is situated at a point two miles east of Taihoku. The sanctuary is built in the old Japanese style. In the neighbourhood is the noted Maruyama park commanding a very fine view.

THE RAPIDS OF SHINTEN KEI Situated at a point about 8 miles from Taihoku and at the confluence of the two rivers of Shinten-Kei, the rapids are among the chief attractions for visitors to Taiwan. On both sides stand out precipices. Shooting the rapids by boat affords a favourite pastime.

Digitized by Google

Tamsui This is one of the four great ports of trade. It is located 13 miles north of Taihoku. About one mile west from Tamsui station lies the ruins of an old Khomoh castle, built by the Spaniards in 1626.

Keelung This is the starting-point of the railway which runs from north to south throughout the whole length of the island. The city with its 62,000 inhabitants extends as far as Taihoku covering a distance of 18 miles. Keelung is not only a port for liners from Japan proper, but is an important port for those sailing to and from south China and the South Seas. Keelung was once occupied by Spaniards and afterwards by the Dutch, and was under the control of the Manchu Dynasty. About 1.5 miles distant from Keelung is located the famous Courbet Beach, where the French Admiral Courbet, in command of the French Asiatic Squadron consisting of 15 warships, landed during the Franco-Chinese War in 1884. This admiral was one of the victims of infectious disease, which claimed a heavy toll among his men. He died on Boko Island where his tomb still stands.

Taichu Located about 100 miles south of Taihoku in the centre of rice production. It is the seat of the provincial government of the same name, with a population of 42,000. Lake Jitsugetsutan is in this province.

Kagi Kagi has a population of 44,800 and is situated 163 miles south of Taihoku. Kagi is the starting point for climbers of Mt. Arisan.

Tainan Tainan has a population of 85,000, being the second largest port of Taiwan. Kaizan Shrine is dedicated to the spirit of Chen Cheng-kung, a loyal subject in the last days of the Ming Dynasty, who came over to this island, drove out the Dutch settlers, and opened war against the Manchu Dynasty, but failed.

Takao Takao has a population of 45,000. Terminus of the central railway line, situated at a distance of 229 miles from Taihoku, this port is as important in the south as Keelung is in the north.

CHAPTER XLII

KARAFUTO (SAGHALIEN)

General Survey

Geography Karafuto is a long island situated in the extreme north of the Empire of Japan along the Maritime Province of Siberia, and separated from it by the Mamiya Straits. The eastern coast is washed by the cold waters of the Sea of Okhotsk, which is bordered by the mainland of Siberia on the north, the Kamchatka Peninsula on the east, and the Chishima Islands (the Kuriles) on the south-east. Japanese Karafuto is the southern half of Saghalien Island, the dividing line being the 50th parallel of latitude; the northern half of the island is under the jurisdiction of Soviet Russia.

At the extreme southern end of the island lies Cape Nishi-Notoro. On the east or opposite side of it, across the Aniwa Gulf, is Cape Nakashirutoko, and embraced by these two capes is the port of Ohtomari at the northern extremity of the Gulf, which is an important port connecting with Wakkanai the extreme northern port of Hokkaido, across the Soya Straits. The traffic connection between Ohtomari and Wakkanai is maintained by freight boats run by the Imperial government railways.

Beyond Cape Nakashirutoko lies Taraka Bay, on the farther side of which Cape Kitashirutoko runs out to the north-east. Thus, Karafuto is deeply indented by the two large gulfs, Aniwa and Taraka, the latter lying to the north-east of the former. The island has two mountain ranges running parallel from north to south with the plains hemmed in between. The total area of Karafuto is 36,090.3 sq. km., the length being 455.6 km. and the breadth from 27.5 at the narrowest to 157 km. at the widest.

Climate The months which enjoy an average temperature above the freezing point are the seven months from April to October. The coldest month is January and the warmest August. The temperature rises suddenly as the thawing season approaches and falls abruptly when the snows set in. The western coast is warmer than the eastern owing to the warm ocean current. The island is, as a whole, high in humidity on account of the frequency of sea fogs, except for the southern point of the western coast, but in both spring and autumn it decreases. Rainfall is most abundant in the summer and autumn seasons.

Population The great majority of the population of Karafuto is Japanese. The following table shows the racial distribution at the end of 1933:

POPULATION BY RACE OR NATIONALITY

Japanese	Korean	Ainu	Other Natives	Chinese	German	Polish	Russian	Total
293,168	5,048	1,354	483	59	2	16	173	300,298

POPULATION IN CHIEF TOWNS
(Dec. 31, 1933)

Toyohara	33,474	Shirutoru	18,877	Hontocho	10,590	Tomarioru	10,459
Ohtomari	30,561	Esutoru	21,043	Maoka	16,161	Rutaka	10,168
Shikuka	17,567	Ochiai	17,567				

Administration The chief administrative office of Karafuto is the Karafuto government and the governor is under direct control of the Minister of Overseas Affairs, but the powers of the former are far wider than those of a governor in the home land, as it extends over mining, forestry, taxation, railways and the postal service. The governmental work of Karafuto is subdivided into four main offices, i. e., Secretariat, Interior Bureau, Forestry Bureau and Police Bureau. The revenue budget of 1934 amounted to ¥25,929,056, of which ¥21,392,488 was from taxes and others, and the rest from various government undertakings and loans to the extent of ¥3,500,000.

Finance

The revenue of the Karafuto government is derived from taxes and other sources of income as well as an annual replenishment from the ordinary account of the national treasury. The principal taxes are :— the town homestead tax, income tax, business profit tax, liquor-brewing tax, liquor-export tax, consumption tax, mining business tax, and fishery tax. The revenue from all these taxes was, in the 1932-33 budget, estimated at ¥1,401,871. The revenue, other than from taxes, consists of receipts from the sales of stamps, railway traffic and freight charges, medical treatment charges at governmental hospitals, charges receivable at the Central Experiment Station, receipts from the sales of trees felled in the state forests, rents of homesteads and various Government buildings and loans. Below is given a brief fiscal history of the Karafuto government :

REVENUES (Yen)

	Taxes and non-tax elements	Replenishment from national treasury	Sum brought forward	Loans	Total

1932	22,428,353
1933	23,566,668
1934	25,929,056

Monetary Organs

The principal monetary organs in the island are the Hokkaido Colonial Bank and the Karafuto Bank. The former is represented by its branches at Toyohara, Ohtomari, Maoka, Honto, Noda, Tomarioru, Ochiai, Shirutoru, Shisuka and Rutaka ; its head office being located at Sapporo, Hokkaido. The business operation of the bank in the island at the end of June, 1933 showed deposits amounting to ¥16,585,702 and loans advanced to ¥15,390,225. The Karafuto Bank is the only one having its head office in the island, its deposits totalling ¥2,150,869 and loans advanced ¥3,496,138 on the same date. The bank came into existence in May, 1914, with a capital stock of ¥500,000 which was increased to ¥2,000,000 in March, 1919. The Karafuto Bank has its head office at Ohtomari and a branch at Maoka. The two banks are doing good work for the development of the island. Beside these banks there is a special bank which has a branch at Toyohara, and that is the Hokumon Savings Bank. This savings bank branch was opened on April 1, 1922. Its local business operation showed at the end of June, 1933, advances figured at ¥183,221 and deposits at ¥677,578.

Military Training Camps

The military training camps ordinance was promulgated in April, 1926, providing for the establishment of camps for the military drilling of youths below the conscription age. The ordinance, however, was not promulgated in the oversea territories, the only exception being Karafuto, where the local authorities in view of the almost complete lack of nationalistic social work in operation and of the smallness in the number of non-Japanese elements in the population, issued an order in May of the same year, making possible the growth of the military drilling work for the youths. Below is shown the present status of the work so far carried on :

MILITARY TRAINING CAMPS

Town	Number of Camps	Attendants
Toyohara	8	238
Ohtomari	7	249
Honto	5	146
Maoka	7	351
Tomarioru	7	164
Motodomari	3	115
Shisuka	4	81

Overseas Trade

The history of the overseas trade of Karafuto since 1905 is a history of steady expansion, though it underwent a frequent recession in the course of those 27 years. The table below illustrates the trend in a more graphic way:

Year	To Foreign Countries (Yen)	To Japan proper (Yen)	Total (Yen)
1927	755,135	90,193,622	90,948,757
1928	937,710	97,000,380	97,938,090
1929	2,042,652	103,034,631	105,077,283
1930	2,335,126	82,140,506	84,475,632
1931	841,655	80,233,395	81,075,050
1932	274,447	92,626,343	92,900,790

SHIPMENTS TO AND FROM JAPAN PROPER

Year	Outward-bound (Yen)	Inward-bound (Yen)	Total (Yen)	Excess of Outward-bound (Yen)
1927	48,740,382	41,453,240	90,193,622	7,287,142
1928	50,915,329	46,085,051	97,000,380	4,830,278
1929	56,388,752	46,645,879	103,034,631	9,742,873
1930	46,812,144	35,328,362	82,140,506	11,483,782
1931	50,984,860	29,248,535	80,233,395	21,736,325
1932	63,510,076	29,116,267	92,626,343	34,393,809

Principal shipments to Japan proper in 1933 consisted of pulp, lumber, paper, marine fertilizer, salt-salmon, salt-codfish, dried herring, dried codfish, fish oil, edible seaweed and canned crabs. Principal shipments from Japan proper during the same year consisted of rice, cotton goods, oils, beer, saké, oats, peas and beans, salt, sugar, soy (Japanese sauce), miso (bean paste), tobacco, fish and shellfish, vegetables, fruits, and mineral products.

Trade with Foreign Countries

The ports open to foreign trade in Karafuto are Ohtomari and Maoka. The countries with which Karafuto entered into trade relations first were Chosen, China, and Eastern Russia. In 1923 the Kwantung Province was brought into trade contact with the island. Two years later there grew up commercial intercourse with Britain, America and Germany, and then in 1926 Spain, Belgium, the Dutch Indies and Egypt became customers of Karafuto. In 1910 the total exports amounted to ¥106,809 and the total imports to ¥307,979. The exports, however, gradually diminished until in 1917 they very nearly ceased. That year saw the same shrinkage in imports also, so that the returns in that year for both the export and import trade showed only ¥68,059. From that point, however, the tide ceased to ebb. A gradual improvement set in after 1918 and the flowing tide recorded a sudden increase in 1919 which reached ¥879,828 in 1921. The imports in that year were only ¥44,725. For some years after, however, somewhat adverse results were recorded. In 1926 the imports were ¥986,914 and the exports ¥2,612, but this adverse tide was increasingly reversed and readjusted as the years went on and the turning point was reached when, in 1929, the exports made a big stride to ¥1,323,407 as against ¥719,245 for imports. In 1930 the exports were ¥1,987,608 and the imports ¥347,518 and in 1931 the exports amounted to ¥635,660, as against the imports which amounted to ¥205,994. The following table contains further detailed information.

Agriculture

There was practically no agriculture in Karafuto prior to its cession to Japan in 1905. No sooner had it passed into Japan's possession than vigorous steps were taken for the reclamation work of all arable lands. Today the annual farm production reaches approximately ¥3,000,000, farm workers 46,364 and arable lands over 400,000 hectares. Yet the lands under actual cultivation cover only 30,000 hectares, which shows that there is still room to accommodate more farming inhabitants. The chief agricultural products are grains, peas and beans, potatoes and green vegetables, and of the grains oats and rye are most abundantly produced. Keeping livestock goes hand in hand with agriculture in the island, for it is by pasturing that the livelihood of the agricultural settlers is made more stable. Every assistance is, therefore, being given by the Karafuto government to live-stock raising. Cattle, horses, swine and foxes are the principal animals kept, with some sheep, rabbits, chickens, ducks, etc. In 1931 the total live-stock product amounted in money value to ¥1,020,203, just one-half of the entire value of farm products.

Mineral Products

Coal The most important mineral product in the island is coal and next to it comes petroleum. The coal producing centres are divided into the northern, southern and central districts. The coal bed is of the tertiary formation consisting of up-

Digitized by Google

per, middle and lower measures. Of the three coal districts the central is the largest and belongs to the lower measure. It runs for 100 kilometres from north to south and has a breadth of from 2 to 5 kilometres. A portion of the southern coal field along the western coast and the greater portion of the northern and eastern coal fields belong to the upper measure. On the northwestern coast there are several important coal fields belonging to the middle measure. The upper measure belongs to the Pliocene and the middle and the lower to the Eocene Period.

At the end of 1933 there were 14 coal fields under operation of an aggregate area of 97,915,360 square metres as against 6 coal-fields of a total area of 23,562,593 sq. metres in 1921. The following table shows the general trend of the increase :

Year	Number of coalfields	Area (sq. m.)	Quantity	Value (Yen)
1921	6	23,562,593	115,255	1,328,512
1922	6	23,562,593	114,547	1,238,198
1923	6	23,562,593	167,304	1,809,422
1924	9	32,030,708	199,385	2,255,713
1925	7	34,413,720	250,615	2,737,970

1929	11	46,923,352	635,515	5,743,322
1930	14	97,915,360	644,963	5,622,177
1931	—	—	637,962	5,249,915
1932	—	—	677,389	5,200,889

Of all the coal mines that of Kawakami used to be the most productive, though now superseded by O-hira mine. Its annual output coming up to 175,875 metric tons in 1932 and 190,210 tons in 1933. The O-hira mine had an annual production of 204,277 tons in 1932 and 290,901 tons in 1933. The Kawakami Mine extends over about 800 hectares located at a distance of 32 km. from Toyohara and is owned and operated by the Mitsui Mining Company, Ltd. The O-hira Mine is operated by the Oji Paper Mills, Ltd. The mine is located at a point about 15 km. northeast of Esudori. Other large coal mines are the Shirutoru, Osakayé, Higashi-Shiraura, Kashiho, Amauchi, Naihoro, Estoru, Chitosé, Mita and Tokai. It is of interest to note from the figures below how the coal-mining work is gaining in importance in the island :

COAL PRODUCTION AND DISTRIBUTION

(Metric tons)

	Production	Shipments from Japan proper	Imports	Exports to Japan proper and foreign countries	Local consumption
1926	275,819	79,327	20,000	6,200	368,946
1927	357,046	49,901	19,953	8,388	418,512
1928	539,481	28,389	8,000	1,530	574,340
1929	635,515	22,469	4,935	16,380	646,539

Digitized by Google

As shown above, so far as the supply of coal is concerned, Karafuto has now become practically self-supporting. Its entire coal reserves are said to be approximately 2,000 million metric tons. It must be remembered that the coal mining business in the homeland (Japan proper) is becoming increasingly difficult to run on a paying basis. The situation in Karafuto is different. There in the island most of the coal mines are worked out in unified and large-scale bases, and the reserves are so large that it insures the continuance of paying operation for many long years to come.

Petroleum Petroleum was first discovered at a point on the south-western coast of Karafuto in 1907 when an official investigation was conducted, after which oil strata were discovered in the neighbourhood of Hontocho, Konotoro, Karabutsu, Maruyama and several other places. In 1930 digging operations were conducted over a total area of 23,204,106 square metres as against 13,344,900 square metres in 1929 and 10,000,800 square metres in 1925. The following shows the annual production :

Year	Amount (Ton)
1920	154,293
1921	115,255
1922	114,549
1923	166,986
1924	199,385
1925	250,615
1926	275,823
1927	357,046
1928	539,481
1929	635,515

Fishery Products

The chief fishery products of Karafuto are herrings, salmon, codfish, trout, crabs, whales and fur-seals, the average yearly catches reaching as much as ¥10,000,000 to ¥20,000,000 in value. There are about 4,000 households dependent upon the fishery industry in the island, the number of fishing-boats in use being about 10,000. Of these varieties the herring comes first in importance, the annual catch being figured at approximately ¥9,000,000. Most of these fishery products are canned in the distributing centres in the island, which did a business of ¥2,119,427 in 1930, ¥1,509,969 in 1929, ¥1,036,744 in 1927 and ¥687,577 in 1926. Of all the canning centres Maoka ranks first, with the total production valued at ¥1,069,265 in 1930. Next comes Shisuka with ¥402,100 and then Tomarioru with ¥340,088 in the same year. Edible seaweed is obtained along all parts of the coast, but principally along the western coast and Aniwa Gulf, the annual production reaching ¥689,600 in 1930. The Seal Island located on the north-eastern edge of Taraka Bay is the only breeding spot of fur-seals in Japan. When the southern half of Saghalien came into Japan's possession in 1905, seal hunting in this small island was prohibited, and every possible protection was given to their breeding. In 1911 the hunting ban was alleviated, the annual number to be killed being limited to 550. In 1913 it became apparent to the supervisors that the number of landing fur-seals was decreasing, so in 1915 the ban was again imposed and was maintained until 1917. It was then withdrawn, with an annual permit to kill up to 550 head. In 1924 the hunting of old, non-breeding fur-seals was started. This increased the production in the year to 824 head and that in the following year to 942. In 1930 the total reached 1,715, and 1,704 in 1931. In accordance with the Fur-Seal Treaty concluded by Japan with the United States and Russia in 1911, Japan is paying 10 per cent. annually of the profit from this fur-sealing to the governments of these two countries.

Digitized by Google

Whales are principally hunted by the ships of the Oriental Whale-Hunting Company which has a base for that purpose in Aniwa Gulf. The catches amounted to 39 head in 1927, 36 in 1928, 34 in 1929 and 36 in 1930. In 1931 none were hunted. The following shows the money value of the chief fishery products:

FISHERY PRODUCTS IN MONEY VALUE (Yen)

Kind	1928	1929	1930	1931	1932	1933

Timber Production

The island is so thickly and extensively covered with primeval forests that, according to an authoritative estimate, about 2,976,491 hectares, i. e., about 83 per cent. of the entire area of the territory, is forest land. In this estimate is included 833,333 hectares reserved for future growth and 79,365 hectares in use for the field work of the Imperial Universities of Tokyo, Kyoto, Hokkaido and Kyushu. There are about 49 species of trees and 73 of shrubs growing on the island, but those that have any commercial value are the Ezo-matsu (Picea ajanensis, Fisch), todo-matsu (Abies sachaliensis, Mast), gui-matsu, ichii (the yew, Taxus baccata), shirakaba (the silver birch, Betula alba), doroyanagi (a willow), hannoki (the black alder) tamo, and a few others. Their distribution is regular, according to district. In the low coastwise districts we find the yanagi, hannoki, tamo, etc.; on the higher levels grow the todo-matsu and Ezo-matsu, and as we climb the slopes forests of the graceful silver birch mix with and replace the pines (matsu), growing thicker and thicker as the mountain peaks are approached. The gui-matsu (a pine species) grows principally in the lower, damper land. But the todo-matsu and Ezo-matsu are the species which predominate in nearly all parts of the island, occupying as much as 80 per cent. of the total forest land. The revenue from the forestry amounted to ¥1,982,221 in 1933.

Forest Administration In ancient times the entire island of Karafuto was nothing but thick forest and the natives seem to have had no rules to prevent them from felling trees whenever or wherever they chose; but they apparently felt no need to fell any large amount of standing trees. The land was almost as primeval as could be imagined when it was ceded by Russia to Japan in 1905. Moreover, during the earlier period of the new régime, devasta-

Digitized by Google

tion by fire was not infrequent. On the other hand, the increased number of population in the island had the effect of increasing the demand for timber in various ways. The first task which confronted the Karafuto government in their forest administration was therefore how to protect the forests from devastation, how best to fell and how to re-stock. As a tentative re-stocking measure large amounts of seeds of todo-matsu, Ezo-matsu, Kara-matsu and silver birch were sown on a wide burnt patch of mountain-side in the neighbourhood of Ochiai in June, 1920. As the experiment was satisfactory, it was decided to make seeding the principal method to be applied for the re-stocking of lands with trees, and the decision was carried into effect on a tract of 15.47 hectares in 1921 and, further, on a tract of 50.01 hectares in 1922. This marks the first period in the re-foresting history of the island. The next period began when, in 1923, the seeding work was carried on over a total tract of 4,285.09 hectares and lasted for the following three years. In 1926 the third period dawned when the acreage was further extended to 11,272.60 hectares and at the same time supplementary sowings were made on 7,740.26 hectares. In 1927 seedings were carried on over a tract of 10,460.74 hectares and the supplementary sowings made on a tract of 2,569.68 hectares. Below more detailed figures are given:

Year	New Seeding (Hectares)	Supplementary Seeding (Hectares)

Seedling Work With the increased need of constantly re-foresting mountains specially with saplings, the seedling work has become quite important. In 1912 the first sapling-plantation was established at Toyohara. But it was since 1920 that its number began to increase, and now there are 17 sapling-plantations established throughout Karafuto producing annually about 6 million saplings. On this subject we have the following figures:

Location	Acreage (Hectares)	Date of Establishment
Toyohara	15.2110	5/1912
Shimisu	4.9500	5/1920
Tokobo	13.0485	5/1920
Tominaigishi	7.9467	,,
Tomarioru	4.6761	,,
Takarazawa	4.9889	,,
Kawakami	6.7287	,,

Total	137.8869	—

Felling Work The present Government's felling work was started in May, 1927, on the estimated basis of an annual production of 535,743 cubic metres of timber. But, in view of the difficulty felt in marketing, the annual aggregate felling was reduced to the basis of 196,370 cubic metres. The business result in the year 1933 was as follows:

	(Yen)
Receipts	1,982,221
Expenses	535,939

Digitized by Google

TIMBER PRODUCTION FOR LAST 10 YEARS

Year	Felling (Koku)	Shipment (Koku)	Delivery (Koku)
1923	2,259,485.77	1,904,560.83	2,111,630.09
1924	2,366,545.98	2,502,820.31	2,547,288.54
1925	1,100,388.91	2,130,118.02	2,169,525.38
1926	744,982.00	1,274,698.17	1,319,501.38
		(cubic metres)	
1927	541,680.473	25,429.015	7,137.030
1928	459,340.777	494,156.669	509,218.183
1929	492,061.608	497,863.054	504,930.773
1930	198,742.706	455,250.462	455,250.462

1932	201,020,000	196,532.000	196,532.000

Forests for University Field Work It was in April, 1914, that a forest tract of 20,000 hectares along the basins of the Ai-kawa (Ai River) and Odasamu-kawa (Odasamu River) was given to the Tokyo Imperial University for the field work of forestry students of its College of Agriculture. Prior to this forest grant the Hokkaido Imperial University was the recipient of a tract of 19,746 hectares of forest area along the basin of the Chinnai-kawa for the same purpose in June, 1913. A tract of 20,345 hectares along the Hoyekawa also was granted to the Kyushu Imperial University in April, 1914. Lastly the Kyoto Imperial University was the recipient of a land-grant of 19,933 hectares along the Kotagishi-kawa and Ato-kawa. Thus, the total area of lands granted for the field work of university students totals 80,024 hectares. The following shows the working result of these university forests in 1930 :

	Tokyo (Yen)	Kyoto (Yen)	Hokkaido (Yen)	Kyushu (Yen)
Receipts	76,178	161,852	14,605	91,928
Expenditures	64,760	28,854	18,780	81,066
Balance	11,418	132,998	4,175	10,862

As it became more and more evident that the re-foresting work with plant-seeds was less economical than had been expected, in 1928 the seeding area was considerably reduced as has been shown in the preceding table, and, instead, greater efforts were made in re-stocking work with saplings, with the result that the total area thus planted reached 900 hectares in that year and 6,124 hectares in 1931. The following shows the result of re-foresting work with saplings in the last 10 years ending 1931 :

Year	Area Planted (Hectares)	Area Supplementarily Planted (Hectares)
1922	34.71	—
1923	19.83	—
1924	58.95	19.83
1925	95.75	—
1926	241.13	25.93
1927	576.16	69.36
1928	918.85	79.92
1929	831.49	567.47
1930	1,244.58	408.55
1931	2,088.44	457.37
Total	6,109.89	1,628.43

Fire Prevention Work The work of fire prevention was initiated in 1922

Digitized by Google

over a stretch of 13,495 metres of forest area, mostly of the area artificially re-planted. But in recent years the prevention work was extended over natural forests, it consisting in making openings or glades, so that in 1933 the total length of these openings for protection from fire reached 992,607 metres.

FIRE-PREVENTION OPENINGS

Year	Extension (metres)
1922	13,495
1923	78,297
1924	87,973
1925	15,173
1926	237,973
1927	157,530
1928	119,129
1929	95,729
1930	22,062
1931	27,962
1932	82,840
1933	55,444
Total	992,607

Re-foresting Work The forest-re-stocking work has hitherto been concentrated on treating burnt patches of mountain side by means of either seeding or of planting saplings, but more recently all forest specialists have come to the conclusion that in Karafuto better re-stocking results would be attained by encouraging the natural recruiting process and this conclusion was put in practice first in 1929 over an area of 173.36 hectares and then in 1930 over an area of 47.90 hectares. In 1931 the same work was carried on over an area of 92.60 hectares, bringing the total area accorded this treatment to 313.86 hectares.

Industrial Development

With the growth of railway facilities the population began to increase, and, with it, various trade and industrial opportunities became more promising. Ohtomari and Maoka are the two ports with the best future outlook, being connected by railways at Toyohara, the seat of government of the island. Paper-pulp manufacturing, canning, brewing, starch manufacturing and butter-making are the leading industries in Karafuto. On December 31, 1932, there were 364 industrial companies incorporated in the island, their aggregate capital being figured at ¥130,330,114 with ¥81,419,808 paid up. The aggregate value of all products in the same year was ¥75,246,895, of which manufacturing products reached ¥48,485,505, (60 per cent.) as against ¥37,569,366, the aggregate sum of all products in 1920 and ¥17,987,842, the total of manufacturing products, in the same year. The comparison shows that there took place a 180 per cent. increase in the turnout of manufacturing products in the 10 years under review. But in view of the almost unlimited quantity of raw materials in the island the progress made so far might be taken as simply indicative of a greater industrial future yet to be fulfilled. Various experiments for industrial purposes were conducted and are being continued at the Industrial Experimental Laboratory at Toyohara.

Pulp In 1913 the first pulp factory was opened at Ohtomari by the Oji Paper Manufacturing Company, already then one of the leading paper manufacturing companies in Japan; then another was at Tomarioru by the Karafuto Kogyo Kabushiki Kaisha, both starting operations in 1915. Soon the World War, which stopped import of paper from foreign countries to Japan, gave an opportune stimulus to the speedy development of the industry and at present there are eight pulp factories in the island turning out an aggregate of 175,000 metric tons of pulp and

Digitized by Google

130,000,000 kilogrammes of paper valued at ¥43,900,000. This means that at present about one-half of the total pulp supplies are from Karafuto. Below is given further information in this respect:

PULP FACTORIES IN KARAFUTO

Company	Location
Oji Paper Manufacturing Company[1]	Ohtomari

		Paper		129,710	24,587,313

Brewing Brewing of saké and other liquors was started in Karafuto soon after it became Japanese territory. But it was found that the original equipment was unsuited for working at the low temperatures encountered on the island, and the earlier attempts were unsuccessful. The local demand for saké was so pressing, however, that the promoters felt it worth while endeavouring to improve all defects in equipment and to procure water of better quality. The result proved to be promising, and today the island-brewed saké is as good as any produced in Japan proper. There are at present about 50 breweries.

PRODUCTION AND SUPPLIES OF SAKÉ

	Production		Import from Japan Proper	
	Quantity (thousand deci-litre)	Value (Yen)	Quantity (thousand deci-litre)	Value (Yen)
1926	72,613	3,842,245	19,771	1,240,445
1927	69,467	3,636,155	19,567	1,222,755

Canning Industry The canning industry in this island goes back to 1909, and in 1917 the canneries numbered 111, with a total production of ¥3,370,558. Crab-canning heads the list; but the reckless catching following that year caused a falling-off in the production, which was reduced to ¥1,458,000 in 1920. The canneries were also reduced in number, numbering only 38 in the same year. Two years later this number was further decreased to 14. In 1925 2 new factories were opened, but the aggregate turnout shrank to ¥663,400. In 1927, however, there took place a sharp revival in the industry. Canneries increased to 20 in number, and production rose to ¥1,029,768 in value. In 1929 the production increased further to a total amount of ¥1,479,969, and in 1930 to ¥1,624,955. In 1931 the number of canneries was 25, and their aggregate production reached ¥1,730,739, showing thus that the productive capacity of each unit of canneries has made a marked expansion. In 1933, the production was ¥1,660,643, with the number of canneries gaining to 29. Most of these canned fishes are exported to foreign markets. In recent years, the demand for this Saghalien canned product in European markets, specially in Great Britain has been on a rapid increase. The South Sea Islands are also increasingly proving to be a fine outlet for this product.

Legal System and Status

Karafuto is different from other dependencies of the country in that more laws of the land of Japan are applied there than in any of the others. But, in that the legal administration is different from that of Japan proper it resembles Taiwan, Chosen, Kwantung Province and the South Sea Islands. The chief point of difference is that all the laws concerning the judicial system, such as the civil law, criminal law, the laws of civil and criminal procedures, and the law of the constitution of the courts of justice are equally enforced in Karafuto and Japan proper. All other laws are made applicable to Karafuto as to other possessions by means of an Imperial Ordinance providing therefor specially. There are some laws enforced in Karafuto which were originally enacted for that purpose. At present there are 169 laws of the land applied or made applicable in Karafuto, of which 13 laws are operative only partially. Imperial Ordinances are applicable or not in Karafuto according to the nature of the provisions contained therein. But cabinet and departmental orders have no operative power in Karafuto just as in other possessions.

There are one local court, 2 district courts, and 7 detached offices of the two district courts in Karafuto.

Education

In 1905 Japan found the island a vast, primitive desert with practically nothing done towards bringing the inhabitants to a civilized way of life. Following, however, the inauguration of Japanese administration, immigrants, including of course adventurers, rapidly increased in number. A number of towns sprang up one after another. These soon grew into centres of activity for the new comers from Japan. Toyohara, Ohtomari and Maoka soon became leading towns. As the immigrants settled down there arose the necessity for schooling their children. This need was directly felt by the government officials who came over to the island with their families and children. It was in August, 1906, that the first elementary school was opened at Toyohara, and in

Digitized by Google

October of the same year 2 other elementary schools were opened, one at Ohtomari and the other at Maoka. At the same time, private educationists started simpler elementary schools here and there in the remote rural districts. In 1920 all elementary schools were brought under the Karafuto government. A middle school was opened at Ohtomari in 1912, a girls' high school at Toyohara in 1916, a middle school at Toyohara in 1925 and another middle school at Maoka in 1927. Meantime, girls' high schools were opened at Ohtomari, Maoka and Tomarigishi. The following tables give the main educational statistics of Karafuto:

TABLE I

Compulsory Education

	Children of School Age	Children Attending Schools	Children Not Attending Schools	Percentage of Attendance
1926	28,280	28,247	33	99.88
1927	29,933	29,889	44	99.85
1928	39,461	39,406	55	99.86
1929	40,725	40,586	139	99.66
1930	46,053	45,967	86	99.81
1931	52,936	45,647	127	99.72

Education of the Natives There are some 2,000 natives in Karafuto including Ainus, Gilyaks, Orochones and Tunguses. The Karafuto government is undertaking to educate the children of these backward natives. At the end of April, 1931, there were 6 schools specially established for the education of these children, for which we have the following account:

School	Location	Number of Instructors	Number of Children attending
Shirahama Kyoikusho	Sakaehama	2	56
Ochiho „	Tomiuchi	1	17
Tarandomari „	Hirochi	2	38
Chiku „	Nayori	1	25
Shinmon „	Tomarigishi	1	16
Shisuka „	Shisuka	1	37
Total 6		8	234

Religion

The three principal religions, i. e., Shinto, Buddhism and Christianity, are competing with one another in this promising field of labour. There are 42 propagating centres for Shintoism representing five sects, viz., Shinto proper, Kurosumi, Tenri, Konko and Taisha. There

Digitized by Google

are three governmental shrines and these are (1) Karafuto Shrine, (2) Toyohara Shrine and (3) Ani Shrine, all of which are dedicated to Imperial ancestors. August 23 is the day set for the annual festival of the Karafuto Shrine, which is also the Inauguration Day of Japanese administration in Karafuto. The shrine is located at Asahiga-oka in a quiet western hilly suburb of Toyohara, and strikes the chance visitor with a sense of admiration for its grave beauty. The anniversary of the Toyohara Shrine falls on July 11. Buddhism is represented by the Shin, Nichiren, Soto, Shingon, Jodo and other sects. There are 59 temples and 112 preaching houses. Christianity is being preached by missionaries of six denominations, i. e., Episcopal Methodist, Presbyterian, Roman Catholic, the Salvation Army, and the Holiness Church. The number of Christian churches in Karafuto is 11.

CHAPTER XLIII

SOUTH SEA ISLANDS

(UNDER JAPAN'S MANDATE)

Geographical Features

The South Sea Islands mandated to Japan, numbering 2,550, are the Mariana, Marshall and Caroline groups, between 131° 10′ and 172° 10′ of east longitude and between 1° 15′ and 20° 32′ of north latitude. They have a total area of 2,148.80 square kilometres. The Hawaiian Islands are to the east; the Philippines and Celebes to the west; the Bonin Islands to the north, and New Guinea to the south. Only one island among them, i. e. Guam belongs to the United States.

The Mariana archipelago starts close to the southern end of the Bonin Islands, stretching towards the equator, and the Marshall and Caroline groups extend to the east and west along the equator, forming an inverted letter "T" with the Marianas. About 740 miles south of the Bonin Islands lies Saipan, the largest of the Marianas, and about 180 miles farther south is Truk, one of the largest of the Carolines, which, marking the crossing point of the inverted "T," is the centre of the mandated territory. The line of 148° east longitude divides the Carolines into the West Carolines, with Palau and Yap, and the East Carolines, with Truk and Ponape. Because of the distances between the islands and the extensive area covered by them, communications are difficult. The fact that each group of isles uses different words peculiar to itself sufficiently demonstrates the degree to which they are separated.

So small are the individual islands in area that the premier ones, such as Ponape and Babelthuap, cover barely 269 square kilometres. Their topography differs according to geological conditions. The Marshalls, which are made up of coral reefs, rise only 1.5 or 2 metres above sea level, but the Marianas and Carolines, which are composed largely of volcanic rocks, have peaks rising as high as 758 metres and little level land. There are no navigable rivers, and in several places good roads are still lacking.

With the exception of Yap, practically all of the islands are composed of volcanic rocks and coral reefs. There are three kinds of coral reefs, though no clear demarcation can be drawn; and the volcanic rocks are of two kinds, basalt and andesite, the former being found in Truk, Ponape and Kusaie, of the Carolines, and the latter in Palau and Saipan. Everywhere in the islands, sea-birds nest and deposit phosphate, but principally on Angaur, Peleliu, Togobei and Fais. The soil also contains some amount of phosphoric acid, which helps vegetables and trees to grow. The narrowness of each islet, the volcanic topography and the dearth of rainfall, however, are handicaps to agriculture.

Groups of Islands

The Marianas The Marianas, the northernmost part of the territory,

Digitized by Google

consist of 14 islands covering 632 square kilometres. At the southern extremity is Saipan, the seat of the Saipan Branch Office, with jurisdiction over the whole of the Mariana archipelago. The Saipan group, 183.89 square kilometres in area, starts 64.36 km. to the northeast of Guam and stretches 104.59 km. to the southwest. Being nearest to Japan proper, the group forms the gateway to the South Sea Islands. It not only enjoys favourable communications with the mainland of Japan, but is endowed with fertile soil adapted to the cultivation of sugar cane, which has drawn no small number of immigrants. Here the South Sea Islands Development Company engages in the refining of sugar.

The Carolines The Carolines, lying along the equator, are divided into the four administrative groups of Palau, Yap, Truk and Ponape. On the island of Corrol in the Palau group are located both the South Sea government and its Palau branch office. The number of isles under the jurisdiction of this branch office is 109, covering an area of 80.29 square kilometres. Babelthuap, commonly called the Main Island of the Palaus, has 370.37 square kilometres. Angaur, about 64.36 km. southwest of Corrol, is called the treasure island of the archipelago, being buried under phosphate mounds. A regular steamship line connects it with Menado of Celebes and Davao of Mindanao, in the Philippine Islands. The Palaus are not only the administrative pivot, but are important geographically.

The Yap group lies 418.34 km. to the northeast of Palau and consists of 85 islets covering 228.91 square kilometres and extending 804.50 km. from north to east. The four main islands, with an area of 36.26 square kilometres, are widely known as a junction of submarine cables. Here also is located the Yap branch office.

The Truk group lies 1,383.74 km. east of Yap, dotting the surface of the sea like a nebula. The Truk branch office, located on Natsu Island, controls 245 islets, which total in area only 124.16 square kilometres. As Natsu Island was formerly the seat of the German local government and later the headquarters of the Japanese defence corps for the entire mandated territory, it is fairly well known to the outside world.

The Ponape group is located 627.51 km. due east of Truk and consists of 138 islets covering more than 492.10 square kilometres. The island of Ponape, with 380.73 square kilometres in area, ranks first among all the islands of the territory. It is full of hills and is lacking in level land. Textile manufacturing and sugar refining were once started here by the Japanese, but later discontinued. Hope is still retained for some industrial undertakings, and a branch laboratory of the Industrial Experiment Station of the islands was established here in 1925 to make trial plantings of rice and medical herbs.

The Marshalls The Marshalls are located 1,222.84 km. east of Ponape. At the southern tip is Jaluit, on which is located the Jaluit branch office, which has control over the main portion of the archipelago, 32 islets, made up of more than 860 coral reefs comprising an area of 150.94 square kilometres. The soil being quite suited to the growth of cocoanut palms, they flourish everywhere. The copra industry of the islands is chiefly dependent on the material produced in this group.

Atmospheric Conditions

All the islands being within the tropical zone, they have one season instead of the four of the temperate

Digitized by Google

zone. Cool sea breezes sweep over them day and night, contributing much toward balancing the temperature, and the inhabitants are favoured with a mild maritime climate rarely found in tropical countries and free from the danger of attack by venomous snakes, wild animals and miasma peculiar to the tropics.

There is an observatory established by the South Sea Government, where all sorts of atmospheric observations are conducted, and four hyetographical observatories. In addition, each branch office of the government has its own observation station. Thorough study of the insular climate is now being planned.

Atmospheric pressure in the neighbourhood of Truk and Ponape is generally low; in the vicinity of the Carolines and western Marianas, it is high in February and March and low from October till December; in the eastern islets of the Carolines, high from May to September and low in other months. The temperature is about the same all over the islands and shows little change through the year, the highest in the daytime ranging from 29° to 31° C. It seldom rises above 31°, and the difference during 24 hours is only 4 or 5 degrees. Humidity averages 82% and rarely falls lower than 60%.

From November to April, the wind generally comes from between the east and northeast. This is the trade wind. From May to October, the direction differs according to the position of the islands. The velocity averages 5 metres in the Marianas, weak in August and September and strong between October and February; in the western part of the Carolines, it is weak in April, May, June and September and strong in November, December, January, February and March.

The mean annual rainfall is more than 3,000 mm., and at Ponape it reaches even 4,000 mm. The rain comes in sudden torrents and passes away with the same suddenness. By this the unbearable tropic heat is greatly mitigated. The rainfall is greatest during July, August and September and least in January, February and March.

The Islands are, as it were, the hotbed of the typhoons that devastate Formosa and Japan proper, but locally the wind rarely gathers hurricane strength. If a typhoon does strike, it leaves the islands in a miserable condition, and the natives fear typhoons as they do their gods. When Ponape was struck in 1906, nearly all the cocoanut palms fell. Jaluit suffered in 1918 and Yap in 1920 and 1923.

A third tempest at Yap caused tidal waves to sweep over the coast, considerably damaging houses, woods and farms. A typhoon at Palau in May, 1927, swept away practically all dwellings in Peleliu and caused no small damage to other islets far and near.

History

The discovery of the islands dates back to the 16th century, when Spain and Portugal were vying with each other for discovery of untrodden soil in any corner of the world. As they are scattered and insignificant, not all of the groups were found at the same time. The Marianas were found first and the Carolines at about the same time, though exploration of the latter was neglected until about 40 years ago, when the Marshalls were discovered.

Found by the Portuguese, the Marianas came into the possession of Spain. Toward the close of the 19th century, Germany took possession of the Marshalls and threatened to encroach on the Carolines, then

Digitized by Google

under Spanish control. Spain protested, and arbitration by the Pope in 1886 terminated the dispute amicably, the whole of the Carolines remaining under Spanish rule. Assiduous efforts by the Spanish to exploit and govern the islands continued until 1899, when, financially straitened due to the war with the United States, they sold the Marianas and Carolines to Germany. The whole of the present South Sea Islands mandated by Japan was thus shifted to the possession of Germany. The German reign lasted until 1914, when a Japanese squadron occupied the islands, which were later juridically placed under Japanese mandate, following the conclusion of the Paris Peace Treaty and other relevant agreements.

German Administration It is generally agreed that the establishment of sovereignty over the Marianas and Carolines by Spain in 1886 and the complete domination by Germany of the Marshalls in 1885 should be made the starting point in historical study of the archipelagos. Until purchased by Germany, the Marianas and Carolines had no government worthy of mention, and nothing now remains to recall the Spanish administration except the defence works on Yap and Ponape and a few buildings standing here and there. After the transfer to Germany, a complete change was effected. In the manner of the British East India Company, Germany started the Jaluit Company shortly after acquiring the Marshalls. The Government took over the business in 1906, when the company's contract expired, and tried to put all the island industries under its monopoly. Thus Jaluit has naturally flourished as the business centre of the territory, reinforced by communications with Singapore, Hong-Kong, Australia and the United States.

In looking back upon the German programme in the South Sea Islands, we are struck above everything else with the largeness of its scale. A general government was first established in New Guinea, which sought to implant German authority in the Orient by embracing the numberless islets between New Guinea and Tsingtao. A step to this end was the laying in 1904 of a submarine cable connecting Yap with Shanghai, Guam and Menado, and in 1913 a radio telegraph station of gigantic size was erected on the same island. To make a scientific study of the South Sea Islands, the German Government dispatched a number of experts. One of their discoveries was phosphate, of which a deposit of 3,000,000 tons was found on Angaur. The German Phosphate Company, founded in Bremen in 1908, conducted mining operations until the Japanese occupation. Other deposits, though less valuable, were located at Peleliu, Togobei and Fais.

Germany exercised special efforts in diffusing culture among the natives, and to this end it dispatched no less than 100 missionaries, who opened churches in all the principal villages of the islands. The older natives still keep the German style of Roman letters to this day. Besides paying attention to educational advancement within the territory, the authorities sent men of talent to Tsingtao for further study.

Relations with Japan It is presumed that there must have been some early intercourse between Japan and the archipelagos because of their geographical position, but there is no reliable evidence of it. The Japanese training cruiser Ryujo in 1884 touched at Kusaie, an islet belonging to the Ponape group, where the chief of the natives enthusiastically welcomed the crew, declaring that his people were descendants of the

Digitized by Google

Japanese race. In the same year, the Japanese Government, informed of the massacre of a Japanese on Raye Island, of the Marshalls, dispatched Mr. Taketaro Goto, who succeeded in settling the matter with the local chieftain. Early commercial relations were initiated by the South Island Company (Nanto Shokai), established at Ponape with the capital of ¥44,000, but its business was soon transferred to the Ichiya Shokai, which failed in 1895. In the year following the appearance of the Nanto Shokai, two other trading firms, the Kaitsu Sha and Koshin Sha, came into existence; the former lasted only two years, but the latter carried on business until the Japanese occupation of the islands. The Hioki South Sea Trading Company was founded in 1893 with branches at Ponape, Truk, Saipan and Guam. Since amalgamation with the Murayama Shokai in 1906, it has been operating as the South Sea Trading Company and doing an extensive business.

Population

According to the census taken on April 1, 1934, the total population of the mandated territory is 85,605, comprising 50,174 natives, 35,328 Japanese and 103 foreigners. Of the natives, there are 46,475 Kanaka and 3,699 Chamorro. The Chamorro enjoy high birth rate, but the Kanaka scarcely maintain the status quo. Those within the jurisdiction of the Yap branch office show yearly decrease.

When Japan took over the archipelagos, there were only a few scores of Japanese dwellers. Gradually increasing, there are now 21,006 males and 14,322 females, most of them dwell within the jurisdiction of the Saipan branch office and are engaged in agricultural enterprises.

When placed under Japanese control, the territory had a hundred Germans, mostly engaged in missionary work and commerce. After they left, there remained fewer than 20 foreigners, chiefly Americans and British. The census taken on April 1, 1934, shows that the 103 registered in 1933 are nearly all engaged in missionary service, cocoanut cultivation or the copra trade.

A census is taken every five years. The village officials and policemen also keep in constant touch with every change. As for Japanese settlers and foreigners, complete investigation is made in accordance with regulations. The first general census was taken in October, 1920, when the first national census was taken in Japan proper, attended with great difficulties and at enormous expense. Subsequent censuses came in 1925 and 1930.

Tribes, Customs and Manners

Tribes Opinions differ as to the tribes residing in the mandated South Sea Islands. Some say that they immigrated from the Malay Peninsula, while others maintain that they are of the Polynesians. Though anthropologically named the Micronesian race, it is evident that they are a hybrid. Separate groups are clearly discernible, each with its own language and customs and manners. Roughly they are divided into the Kanaka and Chamorro. The former belong to the Micronesian race, and the latter are said to be of mixed White and Kanaka extraction, though other explanations are sometimes given.

The Chamorro are supposed to have settled first in Guam, later removing to neighbouring isles, and the fact that they now flourish largely in the Marianas, Yap and Palau seems to endorse the supposition. Though the tribe thrived fairly well under the Spanish régime, it has gradually dwindled, due mainly to massacres, until today it numbers only 3,400. The characteristic features are yellowish brown skin and black hair. The Chamorro, unlike the Kanaka, are industrious and mild in nature. Their mode of living is advanced, and some even reside in foreign-style houses with modern improvements. Their present culture owes much to religious influences in the time of Spanish control.

Kanaka is the general term for the natives of the Pacific islands. Most of those dwelling in the mandated islands belong to this group. They have dark brown or yellowish brown skin, black hair, heavy eyebrows and a big mouth. They are not hairy, and are simple and mild in nature. Though generally of medium stature, some are fairly tall. The Kanaka are cheerful in disposition, but extremely lazy. Their cultural standards are very low, and the mode of living lingers in the primitive stage. Of the total of 50,000 natives in the islands, those belonging to the Kanaka number 46,600.

Customs and Manners Because of the warm climate, it was originally the custom of the natives to wear nothing except a piece of cloth around the waist. Contact with advanced people, however, has brought a change, and some now use foreign clothing. In Saipan and the Marshalls, the natives are clad after the fashion of Europeans, but those in Ponape, Truk, Palau and especially

Digitized by Google

Yap are almost stark naked. The natives are not indifferent to personal adornment. Tattooing is an outstanding example. The more complicated the tattoo marks and the larger the space they cover, the more respected is the owner. There is also the strange ornamentation of scars deliberately cut into the flesh, which has more influence in Ponape than in the other islands. The custom of driving a hole through the ear-lobe for an ear-ring or other dangling ornaments has been becoming less common of late years, due principally to the diffusion of education.

The staple foods of the natives are fruits, fish and meat. Nature bountifully supplies cocoanuts and tubers, which are mainly relied on, and tapioca, bananas, pineapples, mangoes, lemons and oranges, all of which are used as subsidiary food. Under such circumstances, it is but natural that little attention is given to agriculture. Fishing has made but little advance, but the supply of beef and pork is fairly sufficient. Wine and tobacco are greatly sought after, though the use of the former is almost completely prohibited. The habit of chewing areca still prevails.

The structure and appearance of dwellings vary in accordance with the cultural standard of each group of isles. In Saipan there is a street that looks like one in Europe, but in Yap one is reminded of how people lived in prehistoric ages. The dwellings in Truk and Jaluit are far inferior to those in Palau and Ponape, having not even floors. A general lack of windows leaves the interiors sombre and damp. "All-men-houses" are found everywhere in the archipelagos, which serve as a sort of rendezvous for the male villagers or inn for travellers. On Yap there are one or two houses to every village where women live when ailing.

Social Conditions

As the natives are not yet far removed from the primitive stage, their knowledge is very limited. They adhere to the traditions handed down from their forefathers and seem incapable of assimilating with any rapidity the cultural attainments of the outside world with which they come in contact. Only a few can count correctly. Yet they have been progressing in acquiring knowledge since primary education has been introduced. Whatever their intellectual deficiencies, they are fit for manual work.

There are two main social classes, superior and common, and between them there are several transition levels. Every village has its own chief, at whose mercy formerly were the life and property of the villagers. Among the chiefs there used to be ceaseless fighting. Under the German administration, their powers were greatly diminished, and at present they collect taxes and transfer government orders besides attending to the welfare of the people.

As has already been said, their mode of living is very simple, requiring little clothing and no farming for food. They are content to live in any miserable structure which affords shelter from wind and rain. Save for a handful of the Chamorro and a very small number of wealthy people, they live from hand to mouth in perfect contentment and have no thought of providing for posterity. They see no need of taxing their otherwise simple existence by using money. Such as they obtain is invariably spent for such luxuries as soap, perfume, tobacco and canned food, for their daily necessaries are freely provided by nature. Of late years, however, a desire to own co-

Digitized by Google

coanut trees and land has become discernible. They have aversion to anything that requires systematic labour. This is because they are little accustomed to it, there being no need for hard work where food is plentiful without it. In former times they were absorbed in subduing neighbouring villages, but in recent years their barbaric temperament has greatly abated in consequence of appropriate measures taken toward this end by the Japanese Government.

Each group uses its own language or dialect, and there are many instances of different languages in a single group of islets. Between the main island of Yap and the islets within its orbit, there is no common language. Since Japan took charge of the educational work, Japanese has been taught, increasingly meeting the daily needs of the natives.

Administration

Following severance of diplomatic relations with Germany, the Japanese navy occupied in October, 1914, the German territory of the South Sea Islands and established a military government. In December, 1915, when military headquarters were instituted at Truk, the islands were divided into six administrative districts, each governed by a resident garrison commander. In June, 1918, subsequent to the issuance of an Imperial ordinance, a civil administration was created under the commander of the Provisional South Sea Defence Corps, and civil officials took over the functions formerly entrusted to the commanders.

By conclusion of the peace treaty in January, 1920, the islands were placed under Japanese mandate. Realizing the need of effecting fundamental renovation in the administration, the Japanese Government, upon withdrawing the troops, established the present South Sea Government in April, 1922. This was in accordance with an Imperial Ordinance of March, 1922, parts of which were later revised in 1924, 1927 and 1930. The Governor, who presides over the entire administration, is under the control and supervision of the Overseas Minister. Communications affairs are supervised by the Communications Minister, and currency, banking and customs matters by the Finance Minister. In emergencies, however, the Governor is authorized to act upon his own discretion and if necessary to request the commander of the naval station or the nearest responsible naval commander to take military action. The Government Office is composed of six sections: Governor's Secretariat, General Affairs, Finance, Police, Colonial and Communications. The Provisional Saipan Harbour Repair Office, a products museum and an experimental fishery station also belong to it. Under the central government there are branch offices at Saipan, Yap, Palau, Truk, Ponape and Jaluit. All such general administrative business as census-taking, alms-giving, salvation, policing, hygiene, tax collection, education, religion, industry, engineering and harbour works are conducted by those local branches.

Besides the afore-mentioned, there are, under the control of the Governor, 15 elementary schools, 23 public schools, a woodwork training institute, a high court of justice, with a public procurator's office, 3 local courts of justice, each with a public procurator's office, 1 industrial experimentation station with its two sub-stations, 7 hospitals, a mine, 9 post offices and 1 meteorological observatory and its 3 branches.

The branch offices are assisted by so-soncho, kucho, son-cho and joyaku, who are mostly native chiefs.

Digitized by Google

Those in charge of the Kanaka are called so-soncho and son-cho, and those among the Chamorro are named kucho and joyaku. The so-soncho and kucho act under the control and instructions of the branch office to which they belong, and the son-cho and joyaku assist them. The duties entrusted to these officials are (1) thorough diffusion of knowledge of the law and regulations, (2) the making of applications and reports to the branch office, and (3) the conveyance of official instructions and their fulfilment.

Police Administration Under the Police Affairs Section of the central government there is a branch section at each of the six branch offices of the government. In addition, there are a police officer's detached station at Tinian, another at Rota, assistant police inspector's detached stations at Kusaie and Angaur and policemen's offices at 23 less important vilages. The distribution of these stations was determined more by special local conditions than by the density of population, for each branch office of the government has its own peculiar geographical and cultural conditions. On August 1, 1934, the number of police officials at each branch office ranged from 7 to 46.

The regulations for control of the islanders established in 1916 to guard against immigration of persons without property and criminals were amplified and revised in 1917 and 1925. Special consideration is given to firearms and gunpowder, the possession and use of which are strictly prohibited to the insular inhabitants. Beverages of more than 3 per cent. alcoholic content are forbidden except for medical use and religious rites. The possession and consumption of dangerous narcotics, save for medical purposes, are prohibited. Other regulations cover game hunting, publications, social gatherings and the formation of associations, collection of donations, fisheries and the employment of geisha and waitresses.

Finance

The expenditure for insular administration had been met by the military special account until an independent account of the South Sea Government was established in March, 1922.

ANNUAL REVENUE AND EXPENDITURE

Fiscal Year	Revenue			Expenditure		
	Ordinary Revenue	Special Revenue	Total	Ordinary Expenditure	Special Expenditure	Total
1926	¥2,899,869	4,608,958	7,008,827	2,810,110	1,638,464	3,948,574
1927	2,731,318	4,867,667	7,598,980	2,322,188	2,295,481	4,617,569
1928	2,834,212	4,794,669	7,628,881	2,444,201	2,089,909	4,534,110

1935*	5,827,266	150,430	5,977,696	3,156,214	2,821,482	5,977,696

* The figures for 1934 and 1935 are estimates.

The poll tax, customs duties and clearance charges on shipments constitute the premier taxes. A poll tax not exceeding ¥10 is levied on every male native aged 16 or more and from ¥2 to ¥50 on Japanese and foreigners, although there are quite a number of exceptions. All imports from foreign countries are subject to customs duty in accordance with regulations established in May, 1922. These regulations also provide that all shipments to Japan and dutiable at the destination are subject to a clearance duty at the same rate as levied at the destination.

Land and Agriculture

All transactions in real estate owned by natives are subject to approval by the government, a practice initiated by the German administration to safeguard the interests of those whose concepts of property are rudimentary. Total acreage is put at 213,000 hectares, of which about 70,000 hectares are thought fit for cocoanut plantation and general farming. The land already cultivated is calculated at 15,000 hectares for puddy field and dry land and 81,400 hectares for cocoanut plantation, leaving 25,000 hectares for future development. Engaged in agriculture are 40 per cent. of the entire native population, viz., 20,252 natives and 8,730 Japanese. There being little need of depending for their daily necessaries upon farming, the agricultural technique of the natives is still in a primitive stage, but the rapid increase in the number of Japanese, who are setting good examples, will sooner or later bring about some improvement. Live-stock farming is also undeveloped, though the natives raise cows, pigs, goats, hens and ducks, the cows for transportation and farming purposes and the pigs and hens for food.

Sugar-cane cultivation dates as far back as the beginning of the 16th century, but until the arrival of the Japanese there was no sugar refinery and the inhabitants ate the cane raw. The island of Saipan being found fully qualified in both climate and soil, there was established there by the Japanese a sugar industry, which has made a healthy development. From 20 hectares in 1916 cultivation increased to 455 hectares in 1919 and to 6,140 hectares in 1933. There were two companies, with eight factories, in 1919, but in

Digitized by Google

view of the inadvisability of continuing business on so small a scale, the South Sea Development Company, Ltd., capitalized at ¥7,000,000, was established, taking over the Nishimura Colonial Company, Ltd., and purchasing the South Sea Industrial Company, Ltd. Factories of this company are now located on the islands of Saipan and Tinian, the two principal sources of the raw material. Each has a pressing efficiency of 1,200 English tons, but completion of the factory now under construction at Tinian will increase the capacity there to 2,200 tons. Statistics taken in 1932-33 showed 6,140 hectares under cultivation, yielding 43,150 tons of sugar.

Industry

The lack of communication facilities greatly handicaps commercial and industrial advancement, and inadequate supplies of coal, water and iron disqualify manufacturing. The natives have little purchasing power, and the Japanese settlers, numbering 20,000 and possessing superior purchasing power, are scattered all over the isles.

Daily wages for both Japanese and natives are roughly as follows:

Japanese:	
Carpenter	¥3.00 — ¥4.00
Shipwright	3.00 — 5.00
Plasterer	2.50 — 4.00
Blacksmith	2.50 — 3.30
Sugar refinery worker	1.60
Mine worker (mechanic)	2.55
Mine labourer	1.30 — 2.30
Natives:	
Carpenter	¥ .70 — ¥1.50
Shipwright	.70 — 1.50
Day labourer	.70 — 1.50
Mine labourer	.43

The value of the annual production of the principal industries for 1934 amounted to ¥11,432,544, of which the following are principal products:

Sugar	¥10,223,420
Alcoholic drinks	279,451
Spirits for industrial use	437,877

Forestry All of the islands may appear to casual travellers to have good forests, but inspection would disclose that most of the trees are of no practical use. The natives have been careless in removing timber and have disregarded the necessity of reforestation. The only trees receiving attention are the cocoanut palms growing on the island coasts. But this does not mean that forestry enterprises are hopeless. Various kinds of useful trees are seen thriving among the bushes, and the natural benefits here are the very conditions required for the growth of plants.

The cocoanut trees have long been depended on by the islanders for food, and practically every island is shaded by their long trunks and broad fronds of pinnate leaves. According to statistics for 1933, all the cocoanut plantations total 33,176 hectares, and the copra yearly produced therefrom amounts to 10,722 tons.

Fisheries There are no records available of fisheries in the islands before the Japanese occupation. A few Japanese made a start shortly after 1914, but unfortunately they all failed, due principally to unpreparedness to cope with the peculiar geographical and climatic conditions of the region. Only recently have profitable undertakings been established. The lack of transportation facilities, the unique conditions and the limited island market make it imperative that the industry be remodelled.

Bonito, tunny, mackerel, sardine, horse-mackerel and shark are found in abundance in neighbouring waters. In shallow waters near the coasts there are seen everywhere shoals of poly-coloured small fish and all sorts of shell-fish. The crocodile, hawk's-bill turtle and sponge of good quality are also plentiful.

The manufacturing side of the

Digitized by Google

fishing industry is still in its infancy and is still limited to the drying of horse-mackerel, bonito and mackerel by an obsolete process. Some pearls and sponges are cultivated, chiefly at Palau.

Mining The only mining is for phosphate on the Island of Angaur, south of the main island of the Palau group in the Carolines. The island is 15.54 square kilometres in area. The thickness of the phosphate deposit varies from about 3 metres to 7 metres, and the amount available is estimated in 1933 at 1,700,000 tons. For some time after the Japanese occupation of the territory, the mining was carried on by the Navy, but it is now an enterprise of the government. Yearly production is put at 60,000 tons. In addition to the superintendent, who is an expert, there are two assistant experts, three clerks, 442 mine workers, 15 labourers and 4 other employees.

Encouragement of Enterprises Encouragement and financial assistance are given to a number of undertakings, including vegetable farms; coffee plantations, which have been receiving subsidies since 1927; the breeding of cows, pigs and oxen; the growing of sugar-cane and the manufacture of sugar, which were subsidized to the extent of ¥479,044 in 1933, laundries, barber shops, shoe-repair shops and hotels; the cultivation of pearls; and the preparation of dried bonito. As the raising of cocoanut trees is recognized as one of the most promising industries in the islands, regulations were issued in 1922 stipulating that to those who seriously undertake the planting of cocoanut palms a subsidy is to be given at a rate not exceeding ¥20 per 2½ acres of newly planted land and not exceeding ¥10 per 2½ acres of old cocoanut groves put in order. Furthermore, the regulations were revised in 1931 to provide a subsidy of one-fourth of the cost of constructing factories for drying copra.

Since 1924, Saipan and Palau have held competitive shows of the local agricultural produce and handmade articles, supported by the government. In addition, representative products of the islands are exhibited at various shows and exhibitions in Japan proper through the good offices of the government. The South Sea Government Products Museum was established and opened at the beginning of 1930 for the exhibition of all sorts of insular products and geographical and historic studies.

An official investigation is being made in places sparsely inhabited by the natives to see whether there is land for additional immigrants, and wherever land is found and designated suitable for colonization every care is taken to assure comforts for settlers. A survey made in October, 1932, showed the existence of land for 393 families. Another investigation is seeking to distinguish lands owned by the government from those possessed by private citizens. Although no accurate figures are yet available, government-owned cocoanut groves are estimated at about 6,600 acres, with 298,000 trees. From these figures, however, it is difficult to calculate the approximate amount of copra obtainable, for some of the groves are unproductive. A comprehensive survey is in progress.

Experimental Stations The Industrial Experimental Station in the islands, where all kinds of experiments and investigations connected with agriculture and stock-breeding are conducted, utilizes farms totalling 145 acres. The Aquatic Products Experimental Station, initiated in 1931 under the control of the Colonial Section of the government, experiments, among other things,

Digitized by Google

with the preservation of bonito and mackerel and the breeding of sponges, turtles and shell-fish.

Trade The staple exports are phosphate, copra, sugar, dried bonito and alcohol, which account for 96 per cent. of all exports. As to imports, 61 per cent. of the total consists of cereals and other provisions and drinks, cotton textiles and manufactures, clothing and fittings, metal goods, lumber and various wooden articles.

The open ports are Saipan, Palau, Angaur, Truk and Jaluit. Almost the entire overseas trade of the archipelagos is done with the Japanese mainland save for sundry goods exchanged between Saipan and Guam and between Jaluit and the Gilbert Islands and for a nominal amount of sugar from Hawaii and copra and sundry goods from Guam, the Gilbert Islands and Manila.

The total exports in 1933 were ¥18,739,675, of which export to the Japanese mainland was ¥18,155,920. Among exports to Japan, sugar represented ¥12,471,133, phosphate, ¥1,361,879, and copra, ¥1,509,385. The total imports in the same period were valued at ¥8,989,740 of which ¥8,550,486 were from Japan. With countries other than Japan, exports amounted to ¥583,755 and imports ¥439,254.

Transportation and Communications

There are no roads worthy of the name on the islands, though the government realizes that they are the first requisite for industrial development. As large appropriations will be needed, their construction will have to wait for some years to come. Nor are there railways for public use. The short one at Angaur to the phosphate mine, and that at Saipan is exclusively for the hauling of freignt belonging to the South Sea Development Company.

Improvement of transportation facilities is now being concentrated on harbours. Generally speaking, the ports are favourable for mooring, but the long distance between vessels lying at anchor and the landing places, as well as coral rocks extending far into the sea, handicaps their healthful growth as modern commercial ports. The construction of modern harbours depends upon magnanimous appropriations and years of labour. The first real harbour, started in 1926 and completed in 1931 at a cost of more than ¥1,000,000, was at Saipan. A second project was launched in 1927 at Corrol, where, between the vessels at anchor and the landing place, lies a coral-reef. The work came to an end after the expenditure of ¥106,992 in 1930.

Shipping Routes Upon the creation of the South Sea Government, all government-controlled shipping routes were placed under the Nippon Yusen Kaisha, Ltd. The schedule for these lines in 1933 follows:

(1) West Round Line: Plying between Japan and the Philippines, the ships touch at Yokohama, Osaka, Kobé, Moji, the insular ports, Menado and Davao, covering both ways in 44 days. 17 voyages are made a year.

(2) East Round Line: Plying between Kobé and Jaluit, the ships of the line call at Saipan, Truk, Ponape and Kusaie, covering both ways in 50 days. 6 voyages are made yearly.

(3) East and West Connecting Line: Between Kobé and Jaluit, this line includes calls at various insular ports. Both ways are covered in 53 days, and 6 voyages are made a year.

(4) Saipan Line: The ports of call are Yokohama, Osaka, Kobé, Moji, Futami, Saipan and Tinian.

Digitized by Google

17 round-trips, made in 28 days, are scheduled for the year.

The number of vessels on these lines is 8, ranging from 2,444 to 6,143 tons.

Among the islands themselves, shipping has been entrusted to the South Sea Trading Company, Ltd., which is subsidized by the Government. The services now available are: the Mariana line, connecting scattered islets within the Mariana Archipelago, available 17 times a year; the Yap, Palau, Truk and Ponape lines, each with 4 trips a year, and the Marshall line, which makes 7 trips a year. In addition there are Ponape, Truk and Palau ines. Five vessels are used, ranging from 192 to 541 tons.

During 1933, vessels that entered and cleared the nine ports of the territory numbered 511 and 503 respectively—354 steamships, 149 sailing vessels clearing and 359 steamships, 152 sailing vessels entering. The numbers of passengers landing and embarking were 11,598 and 13,904 respectively.

Other Means of Communication All means of communication were placed under the control of the local government when it was established. The Communication Section thus takes care of (1) post, telegraph, telephone, exchange and deposit services, (2) postal insurance, and (3) sea-routes, vessels and nautical markings. There are nine post offices, situated at Saipan, Jaluit, Tinian, Rota, Palau, Yap, Ponape, and Angaur. Each handles wireless messages. The cable and wireless lines now operated are as follows:

(1) Between Yap and Bonin Islands: dispatched by the Chichi-jima Wireless, relayed at Saipan.

(2) Between Yap and all except the Bonin Islands: dispatched on the submarine cable through Naha, Ryukyu (Loochoo).

(3) Between the South Sea Islands, except Yap, and Loochoo and Taiwan: sent by submarine cable.

(4) Between the South Sea Islands, except Yap, and the Bonin Islands: sent by the Chichi-jima Wireless, relayed at Saipan.

(5) Between the South Sea Islands and all outside points except the Bonin Islands, Taiwan and Loochoo: dispatched by the Tokyo Wireless, relayed at Palao.

Telephone facilities are still limited, switch-boards being installed at only Palau and Saipan.

Judicial System

The judicial branch of the South Sea Government employs the double trial system, the court for the first trial being one of the Local Courts of Justice and for the second trial the High Court of Justice. To each court is attached a public procurator's office. In remote places, minor irregularities, both civil and criminal, are disposed of by the judgment of the branch office heads.

The South Sea Government High Court of Justice is located in Palau. The Palau Local Court of Justice has jurisdiction in the Palau and Yap groups; the Saipan Local Court of Justice, in the Saipan group, and the Ponape Local Court of Justice, in the Ponape, Truk and Jaluit groups. On June 30, 1933, there were three judges, two procurators and four secretaries in the judicial system.

Most legal regulations are the same as in Japan, but due consideration is given to the customs and conditions peculiar to the natives. Their civil affairs are handled quite independently of those of settlers from outside; hereditary practices in land ownership are preserved, none but government officials being permitted to sell, purchase or mortgage their land; legal proceedings

Digitized by Google

are made as simple as possible, and natives sentenced to less than one year of penal servitude may be subjected to labour instead of being sent to a prison.

Education

Besides elementary schools for the Japanese, there are 24 for natives throughout the insular territory. Though education is not compulsory, schools are provided, clothing and food supplied in particular cases and pupils from remote places received into dormitories. At the schools for native children, natives are employed as assistant instructors. The Japanese instructors must have the full qualifications of elementary school teachers in Japan proper.

There are schools for Japanese children in Saipan, Palau, Truk, Tinian, Yap and Ponape, and where there is no near-by Japanese school a Japanese class is attached to the native elementary school. The course of instruction, requiring six years, and the textbooks are the same as in Japan proper. The natives' elementary education takes three years, and after that they are free to enter continuation courses of two years. The lessons are about the same as those taught in the Japanese schools, save for the stress placed on ethics, calculation and the Japanese language. To teach carpentry, a special institute is attached to the Corrol Public School for natives.

Christian schools number 3 in Saipan, 1 in Palau, 6 in Truk, 2 in Ponape and 3 in Jaluit. All of them are attached to churches and naturally concentrate on diffusing knowledge of Christianity. They are not worthy of being called educational institutions in the strict sense.

With the object of popularizing education, a scholarship society was formed on the foundation of an Imperial donation, ¥2,000, in February, 1924. The society is headed by the Governor, who, with the interest accruing to the original and yearly scholarship grants by the government, does everything possible to encourage deserving students. There is also the South Sea Islands Educational Society, headed by the Governor and with branches at the seats of branch offices of the government. Its sole object is elevation of the educational standard of the islanders.

The elementary schools for the Japanese, according to statistics taken at the end of April, 1934, have 63 instructors and 3,936 pupils—2,025 boys and 1,911 girls. Besides, there are 8 instructors in charge of the continuation courses, with 404 students under them. The schools for natives have 58 Japanese teachers and 23 native assistant teachers, 1,303 boys and 1,005 girls attending elementary school course, and 412 boys and 225 girls in the continuation course.

There are some private institutions, mostly kindergartens, for Japanese children. Kindergartens are found in Saipan, Yap, Palau, and Ponape, haivng in all 15 Japanese teachers and 295 children. A private elementary school for natives in Jaluit has 42 children under 2 instructors, 1 of whom is Japanese.

As there were not very many Japanese children, no middle school was in existence in the archipelago prior to 1933. But owing to the industrial development and the increase of Japanese residents, it became necessary to establish one, and in accordance with the prefectural ordinance of March, 1933, an industrial school was established in the island of Saipan.

Religion

Among the native inhabitants there is no religion worthy of the

Digitized by Google

name, but they have a sort of religious belief. Christianity was first introduced and propagated by Spaniards in 1666. A Jesuit missionary worked enthusiastically in Guam until banished in 1766 by Charles III and is said to have initiated the islanders into the methods of cultivating corn, tobacco, cocoa and potatoes. In more recent times, an American missionary group gained influence, though it finally abandoned work in Ponape and Truk, as did a Protestant mission group from Germany in the former island. Catholicism went on evangelizing side by side with Protestantism and is said to have had more funds. Priests of the Otani branch of the Shinshu Sect of Buddhism established themselves in Saipan for religious propaganda in 1919, and in 1926 a Tenrikyo church was opened in Palau.

Soon after the evacuation of the German Protestant missionaries, the Japanese Congregational Church despatched four missionaries to Ponape and Truk. American missionaries in Kusaie and Jaluit are engaged in educational as well as religious work, and Catholic missionaries, who came in 1921 from Spain, are also active. It is generally accepted that the natives' mild temperament is the result of the long and untiring efforts of the missionaries. Generally speaking, Christianity seems to have placed the entire population under its influence, but very few of the church-goers understand its tenets.

The Charitable Society, founded on an Imperial donation of ¥1,000, was organized in May, 1927, in commemoration of the demise of the late Emperor Taisho. It is financed by the interest accruing to the foundation and contributions, and its principal mission is salvation of the poor and afflicted. So far its main accomplishment has been caring for lepers, 46 of whom are accommodated in 4 sanatoria.

Medical and Hygienic Services

In general, there is less malignant disease in the islands than in other tropical lands. But the fact that most of them are coral reefs and small in area makes it difficult to obtain water supply. Rain-water tanks are the usual source, and they often prove the agency for spreading sickness. When the trade wind begins and ends, bringing changes in the climate, influenza occasionally rages. The natives are most unsanitary and even when taken ill hesitate to consult a doctor. Despite untiring efforts by the authorities to better hygienic conditions, long-established customs have impeded progress.

The principal endemic diseases peculiar to the islands are amœboid dysentery, frambœsia and dengue. Dysentery breaks out at places all the year round, but the symptoms are generally slight. Frambœsia, rampant among the natives, afflicts but few Japanese. In recent years,

Digitized by Google

in consequence of injecting salvarsan as a remedy, the number of those contracting it has decreased.

Dengue is at times so prevalent that nearly every inhabitant has it, but few fall victims to it. Fortunately, the islanders have never been attacked by malaria fever, cholera, pest, yellow fever or sleeping sickness. Typhus, paratyphus, dysentery and a few other infectious diseases, however, are common. One suspected case of small-pox was reported in 1926, but it was agreed that the patient had contracted it while travelling in China and Japan.

Medical Facilities Medical practitioner's offices are maintained by the government, and for the benefit of those living in remote places visiting doctors are despatched several times a year. The entire territory is divided into three classes, A, B and C, according to the standard of living, and medical charges are fixed differently; class A, for instance, paying from a third to half as much as the resident Japanese. The task of health protection lies heavily upon the shoulders of the government, for the number of private medical practitioners within the territory is still far from sufficient. According to statistics taken in June, 1934, officials in the government medical service throughout the insular territory include 24 doctors, 7 pharmacists, 3 secretaries, 7 employees, 7 assistants, 8 midwives and 22 nurses.

Special precautions are exercised against the outbreak of epidemics, and all arriving vessels are subjected to strict quarantine inspection. Compulsory vaccination is being practised, as in Japan proper. Geisha and waitresses undergo examination at least once a month. Lepers are found in several places,

Digitized by Google

though the exact number is not yet available. The government opened a sanatorium in Saipan in 1926 and added others in Jaluit and Palau.

The health inspection is conducted in the schools once a year. The results indicate that though the physical growth of the native children generally surpasses that of the Japanese, cases of malnutrition and disease are much more numerous among the former. Inspection of water, and investigation of the causes of deaths are practised to aid health and hygienic improvement.

MANCHOUKUO

Geography

Position Extending between 38°43′ and 53°30′ North latitude and 117°50′ and 135°20′ East longitude Manchoukuo is bordered on the north by Siberia and on the east by Korea and the Maritime Province of Siberia.

On the west its borders touch Outer Mongolia, Eastern Inner Mongolia and China proper, while on the south its shores are washed by the waters of the Yellow Sea and the Gulf of Pechili, the coast line extending over 855 nautical miles.

Topography Topographically, Manchoukuo is a vast expanse of plains, traversed from north to south by the Great and Little Hsingan (Khinyan or Khingan) mountain ranges in the north-western section, and by the Changpai mountains near the south-eastern boundary.

Several great rivers with many tributaries run through Manchoukuo, irrigating the plains which they pass. The most notable of these rivers are the Heilungkiang (Amur), Sungari, Ussuri, Yalu, Tumen and Liao Rivers.

Climate The climate of Manchoukuo is typically continental, despite the fact that this country lies within about the same latitudes as Japan, Korea, France and England.

Almost unaffected by ocean currents, Manchoukuo has a dry, cold climate with long severe winters and short hot summers. The spring season is windy, strong winds often carrying yellow dusts from the west.

The temperature falls as low as 49° C. below zero in winter and goes up as high as 40.0° C in some localities in summer.

Area, Population, Language, etc.

Area and Population The area of Manchoukuo is put at 1,300,000 sq. km. and is about twice as large as the combined areas of Japan proper, Korea, Formosa and Karafuto. The population at the end of 1933, according to the investigation made by the statistics bureau of the Executive Yuan, was 30,879,717. This population as divided according to the various provinces, which were newly established in December, 1934, with the area of each province, is as follows :

POPULATION AND AREA

Language Chinese is the official language of Manchoukuo, although native Manchus and Mongols living in the interior districts speak their own dialects and Japanese is now being taught at many native schools in Hsinking and other important centres of the country.

The original Manchus now living in the country are estimated to number between six and seven millions, but most of them speak Chinese, only those who live in some districts of Kirin province keeping to their own native dialect.

As the official, social and commercial language, the Peking mandarin language is most widely used in Manchoukuo, but the Shantung, Nanking, Shanghai, Canton and other dialects are spoken among the immigrants from these different parts of China.

Among other foreign languages Japanese and Russian are the best known in the country.

Banditry Manchoukuo has long been noted for its mounted bandits who ravaged the country. Under the old militarist régime even regular soldiers turned to banditry and quite often they were enlisted among the regular troops when in need, so that the troops and bandits were not clearly distinguishable from each other.

Bandits in Manchuria once numbered as many as 200,000 after the Manchurian Incident owing to the fact that the regular troops in the

Digitized by Google

army of Chang Hsueh-liang resorted to banditry. But the strenuous efforts of the Japanese and Manchoukuo troops have reduced the number to about 50,000 by the end of 1932.

As a result of the pacification of Jehol early in March, 1933, the base of operation of the major bandit groups was completely wiped out. With the view to furthering the work of restoring peace and order, a central peace preservation committee was organized in Hsinking. Between the autumn of 1933 and the early spring of 1934, an intensive campaign was directed against the remnant outlaws in Kirin province. The bandit-insurgents have been reduced to less than 40,000. Efforts are being made to confiscate the weapons illegally possessed by the people, to reduce the number of the so-called vigilance corps of the professional type, and to give work to the roaming outlaws who surrender to the authorities.

History

Before Ching Dynasty Nearly twenty different dynasties have ruled successively in the territory now under the sovereignty of Manchoukuo, which includes Manchuria and part of Mongolia, from the Sushen dynasty to about the second and third centuries down to the Ching dynasty, which lasted from 1636 until 1911, when its rule was replaced by the new régime of the Republic of China.

The Ching dynasty was known as the Nuchen tribe before it gained hegemony in China proper. In 1636, the chief of the Nuchen tribe declared independence at Mukden against the Ming dynasty which was then in power in China proper, naming his country, which extended over the area now forming the territory of Manchoukuo, "Taching".

After rising to independence in Manchuria, Taching gradually expanded its territory until 1664, when conquering the Ming forces it occupied Peking and made that city its capital, after which Manchuria seemed deserted, except Han immigrants who came from China proper and inhabited in Manchuria, though only sparsely.

Thus Manchuria was left neglected by the Manchus, who were almost entirely occupied in colonizing China proper, and when Russians penetrated into Manchuria they could do much as they liked in this region.

It was not until after the Russo-Japanese War that the Chinese authorities came to see the need of attending to the administration of Manchuria with any degree of seriousness. With this object in view, Hsu Shih-chang was appointed Viceroy of the Three Eastern Provinces in 1907, and notable improvements were effected in the systems of administration, communications and transport during the following few years.

The late Marshal Chang Tso-lin came into power in Manchuria after the Revolution of 1911, when Chao Erh-hsuan, then Viceroy of the Three Eastern Provinces, asked him to render military assistance to resist the advance of the revolutionary forces on Manchuria.

Rise of Chang Tso-lin The rapid ascendancy of Chang Tso-lin then followed and in 1916 he was appointed Inspector-General of the Three Eastern Provinces, thus virtually placing the entire territory of Manchuria under his autocratic rule.

After a series of three civil wars with the Chihli army, in the course of which General Kuo Sun-lin, one of his lieutenants, made an unsuccessful attempt to overthrow him, Chang Tso-lin started hostilities with the Kuomin army of Feng Yu-hsiang, the so-called "Christian General",

Digitized by Google

in January, 1926, and occupying Peking in December that year, installed himself as Generalissimo at Peking in June, 1927, thus attempting to reign over the entire territory of China.

This marked the peak of the ascendancy of the Mukden war-lord, for, in June, 1928, he had to leave Peking for Mukden ostensibly with the intention of spending the rest of his life in retirement. It was on this trip back to Mukden that the Marshal was killed in a train wreck near Mukden.

Under Chang Hsueh-liang Chang Hsueh-liang, known as the young war-lord of Mukden, then stepped into his father's shoes, but finding himself unable to keep effective control over the lieutenants of his late father, he declared allegiance to the National Government in December, 1928, and was appointed commander-in-chief of the North-Eastern Frontier Army. This was followed by the renaming of Fentien province as Liaoning in March, 1929. During the civil war of 1930, Chang Hsueh-liang maintained an attitude of sympathetic neutrality, thereby making it possible for the National Army to defeat the rebels under Yen Hsi-shan and Feng Yuhsiang. Apparently in appreciation of this, the National Government appointed Chang Hsueh-liang Vice-Commander-in-Chief of the National Army, Navy and Air Forces.

In 1931, Chang Hsueh-liang moved his headquarters to Peking and during his absence, all his influence in Manchuria was overthrown following the outbreak of the Manchurian Incident on September 18, 1931.

Founding of Manchoukuo The effort directed at restoring peace and order as the Chang Hsueh-liang government was driven out of Mukden by the outbreak of the Manchurian Incident first materialized in the Committee for Preservation of Local Peace and Order organized at Mukden. This soon led to the organization of the independent government of Fengtien province, the example of which was followed by Kirin and Heilungkiang provinces. Later, an Administrative Committee composed of members coming from various provinces was organized and preparations for establishment of the new state were made.

On February 18, 1932 the Committee fulfilled its first duty by announcing the declaration of the establishment of an independent state and appointing a standing committee of seven members for discussing various detailed problems. The fundamental principles of the new state as announced by the committee on February 25 are as follows: the new state to be called Manchoukuo; the ruler to be called Chief Executive; the flag to be a five-coloured one; the new era to be called Tatung; and the capital to be Changchun, which later came to be called Hsinking.

Mr. Pu Yi, who was formally elected Chief Executive by the Administrative Committee, took office on March 9. The law regulating the organization of the government and the law guaranteeing personal rights were promulgated on the same day. On the following day, Cheng Hsiao-hsu, Prime Minister, and other high officials were appointed.

At the request of the people of Manchoukuo, who appreciated and enjoyed the benevolent administration of the new régime under His Excellency Pu Yi, many of their leaders in Mukden and other principal cities and towns petitioned for his enthronement as Emperor of Manchoukuo in the beginning of 1934. This was accepted, and the Chief Executive was formally enthroned on March 1, 1934, the second

Digitized by Google

anniversary of the founding of Manchoukuo. The state was thereafter called Manchoutikuo, which means the Empire of Manchuria, the Chief Executive the Emperor Kangtê, and the new era Kangtê.

Japan in Manchuria Japan's close relation with Manchuria began with the Sino-Japanese War of 1894-95. The actual invasion of Manchuria by Russia, which was active in that region since 1858, came after the Three Powers' intervention in 1895, which wrested from Japan Liaotung Peninsula, a territory acquired by Japan as a fruit of the War. This was but the beginning of unrestrained activities of Russia in Manchuria. She established the Russo-Chinese Bank with a capital of 15,000,000 roubles, which was followed by acquisition of right from China to build the Chinese Eastern Railway through Kirin and Heilungkiang provinces, together with the right to operate mines in these two provinces.

In March, 1898 Russia acquired a twenty-five years' lease of Liaotung Peninsula, which included the right to construct a railway from a point on the Chinese Eastern Railway down to Port Arthur. This railway line was completed in 1902.

Moreover, Russia took advantage of the Boxer Uprising in 1900 and dispatched troops to many important places in Manchuria. These troops Russia refused to withdraw, in spite of her promise to do so after the suppression of the uprising, and concentrated her forces on the Korean border, thus obviously menacing the safety of Japan through Korea.

All these were sufficient to lead to the Russo-Japanese War of 1904-05, in which Japan was victorious. By the Treaty of Portsmouth, Russia transferred to Japan the lease of Kwantung province and all rights, privileges and concessions connected with or forming part of this lease. The Treaty also provided for Russia's transfer to Japan of the railway between Changchun and Port Arthur and all its branch lines, together with all rights, privileges and properties appertaining thereto.

What are known as the special rights and interests of Japan in Manchuria are mainly based on the Treaty of Portsmouth and also on the terms of loans advanced to China for the construction of railways, as well as several other agreements.

Government

Manchoukuo abrogated, with the accession to the throne of the Emperor on March 1, 1934, the Organic Law, which was in force since 1932, and promulgated on the same day the new "Organic Law of Government", which may be taken as provisional constitution. According to the new Law, the Emperor exercises all the executive powers with the assistance of the Privy Council, which may advise him on important state affairs.

The governmental power of the state is divided into four and vested in Executive, Legislative, Judicial and Supervisory Yuans.

The Executive Yuan, which corresponds to the cabinets of other countries, is headed by the Premier and comprises the various Ministers of State respectively heading the Civil Administration (Home Affairs), the Foreign Affairs, the Military Administration (War), the Finance, the Industry, the Communications, the Justice, and the Education Department.

The legislative power is vested in the Legislative Yuan, whose approval is necessary for all laws and revenue enactments, while the Supervisory Yuan supervises the conduct of officials and audits their accounts. The members of the Council may not be dismissed except for criminal of-

Digitized by Google

fence or as disciplinary punishment, and may not be subjected to suspension or transfer of office, or reduction of salary, against their will.

The present personnel of the Manchoukuo Government includes the following. A complete change took place on the State Affairs Yuan on May 21, 1935 :

Privy Councillors :
Tsung Shih-yi (president),
Yen Chin-kai, Kuei Fu, T. Tsukushi,
H. Tanabe, Tseng Yun, H. Yada.
Hsieh Hsiao-hsu, Shen Jui-lin
State Affairs Yuan (Executive Yuan):
Prime Minister—General Chang Ching-hui
Home Minister—Lu Jung-huan
Finance Minister—Sun Chi-chang
Foreign Minister—Chang Yenching
Defence Minister—General Yu Chishan
Industry Minister—Ting Chien-hsiu
Communications Minister—Li-Shao-keng
Education Minister—Yuan Chentse
Justice Minister—Feng Han-ching
Imperial Household Minister—Hsi Hsia
Mongolian Affairs Minister— Chi Wang
Legislative Yuan
President, Dr. Chao Hsin-po

Preparations had been made to effect fundamental revisions in the system of local administration and the four provinces of Fengtien, Kirin, Heilungkiang, and Jehol were reorganized into ten new administrative provinces, and the new system became effective on December 1, 1934. At the same time a new Department known as the Mongolian Affairs Department was formally inaugurated, and the four subprovincial governments of Hsingan Province were left unchanged. The names of provinces and their governors follow :

Provinces	Governors
Fengtien	Pao Kang
Kirin	Li Ming-shu
Pinkiang	Lu Jung-huan
Lungkiang	Sun Chi-chang
Chinchou	Hsu Shao-ching
Antung	Wang Tsu-tung
Jehol	Liu Meng-keng
Sankiang	Chin Ming-shih
Chientao	Tsai Yun-sheng
Heiho	Chung Yu
Hsingan, Eastern Division	E-lei-chun
,, Southern ,,	Yeh-hsi-hai-shun
,, Western ,,	Cha-ko-erh
,, Northern ,,	Ling Sheng

National Defence

History The Manchurian army has its origin in the Liian army which rendered great services in founding the Ching dynasty. They were since then hereditary and were garrisoned in various important points. After the Chinese Revolution of 1911 the army was modernized, and in Manchuria, there were stationed two divisions of the 27th and 28th numbering from 30,000 to 40,000. When Chang Tso-lin came into power, he increased it to 200,000, which was again increased by his son to 260,000 regulars with an additional 100,000 held as provisional forces. There was kept also a small fleet of 7 gunboats to protect trade carried on the rivers. These were the military forces in service under Chang Hsueh-liang at the time of the outbreak of the Manchurian Incident.

Present Status The army and navy of the empire is under the supreme command of the Emperor, and is garrisoned in defence of particular districts prescribed by the Emperor.

The Department of War has following 9 bureaux and offices ;

(1) The Staff, (2) The War Supplies Bureau, (3) The Horse Administration Bureau, (4) The Central Army Training Depot, (5) The Central Clothing Depot, (6) The Central Arsenal, (7) The Central Military Propaganda Bureau, (8) The central "Seikyo" Commission ("Seikyo" literally means purification of local districts), and (9) The Defence Headquarters.

The military forces at various points are ;

Digitized by Google

1. The Imperial Guards
2. The Guards of Honour
3. The Flying Corps
4. The Gendarmerie Headquarters
5. Fengtien Army
6. Kirin „
7. Heilungkiang Army
8. Jehol „
9. East Hsingan „
10. North „ „
11. South „ „

The army numbers 120,000. As to the coastal and river defence, the country maintains 8 warships, 7 gunboats and 3 vessels.

Foreign Relations

With Japan (1) Recognition by Japan. Japan is the only country with which Manchoukuo is exchanging envoys. Her relation with Japan is defined in the Japan-Manchoukuo Protocol signed on September 15, 1932, between the two countries at Hsinking, providing for their mutual defence. (See p. 204) The document is also notable for the fact that by virtue of it, Japan accorded recognition de jure to the new state far ahead of other nations.

(2) Emperor Kangtê's visit on Japan. In June, 1934, Prince Chichibu was sent to the Empire to convey the Imperial Message of Congratulation to the Emperor and Empress of the new state. In return for this, the Emperor Kangtê paid a visit to Japan, arriving Tokyo on April 6, 1935, and made a formal call on the Emperor of Japan on the same day. He stayed till April 24.

(3) Abolition of Extraterritorial Privileges. Manchoukuo has confirmed, by the Japan-Manchoukuo protocol, the extraterritorial privileges which Japan had been enjoying under treaties with China. But the development and progress of the country, since its founding, in all branches of administrative system, which are connected with extraterritoriality, for instance, in judicial, police and taxation systems, have been noteworthy. In fact more than ¥8,000,000 was set up for the reform of these systems in the budget for 1934. Accordingly Japan decided to give up the rights of extraterritoriality and obtained the Imperial sanction for doing so on August 9, 1935. The decision has to do with the principles and the actual abolition is to be effected in gradual stages and in accord with the reform of the governmental systems and organs of Manchoukuo. (See Appendix.)

(4) Japan-Manchoukuo Economic Agreement. The agreement regarding the establishment of a joint Japanese-Manchoukuo economic commission was signed on July 15, 1935, at Hsinking by General Jirō Minami, Ambassador to Manchoukuo and commander of the Kwantung Army, and Mr. Chang Yen-ching, Foreign Minister of Manchoukuo. The object of the agreement is to extend to the economic field the inseparable relations between Japan and Manchoukuo that already exist in the defence and diplomatic fields and to accelerate the formation of the economic bloc between the two countries.

With the League of Nations In regard to the issue of the Sino-Japanese dispute at the League of Nations, Manchoukuo was concerned only indirectly as it is not a member of the Geneva organization. During the Council and the Assembly meetings of the League at which the problem was discussed, late in 1932 and early in 1933, General Ting Shih-yuan, who was later appointed Manchoukuo Minister to Japan, stayed in Geneva as a personal representative of the then Chief Executive, now the Emperor Kangtê. With the assistance of a few advisers he presented the case of his country on several occasions to the League of

Digitized by Google

Nations through the Japanese delegation, and otherwise made efforts, though without avail, to influence those attending the League meetings in favour of his country.

With Soviet Russia (1) The N. M. R. Issue The issue of the North Manchuria Railway was first brought to light in connection with the dispute regarding the alleged unlawful detention of locomotives and carriages of the railway by the Soviet officials, followed by the partial suspension of through traffic on the line by the Manchoukuo authorities. By this suspension the connection between the North Manchuria Railway and the Ussuri Railway was almost completely cut away. Not only the loss which the Ussuri Railway would sustain was enormous, but the fate of Vladivostok was also likely to be sealed thereby. Alarmed at this, Russia hastened to come to Japan asking to render assistance for the solution of the problem.

(2) Purchase of N. M. R. In view of this and previous troubles concerning the North Manchuria Railway, Soviet Russia proposed to dispose of the railway and a conference was opened in Tokyo in June 26, 1933, between the representatives of Manchoukuo and Soviet Russia headed by General Ting Shin-yuan and Mr. Constantin Youreneff, with a few Japanese officials attending the parley as observers.

The most seemingly unsurmountable difficulty at the conference was the price to be paid for the railway, which the Soviet valued at 250,000,000 gold roubles which, calculated at its specified exchange rate, would amount to ¥625,000,000, although they later offered to reduce it to 200,000,000 gold roubles, while the Manchoukuo representatives persistently declared that they were not willing to pay any more than ¥50,000,000 for the line.

The deadlock continued with little prospect of its being overcome and after meeting six times in plenary session the representatives of the two countries continued the discussion in unofficial conversations in the hope of finding a way out of the difficulty. At last through the good offices of the Minister of Foreign Affairs of Japan, Mr. Kōki Hirota, the conference came to be amicably closed and the transference of the N.M.R. was effected on March 23, 1935, the value of the railway having been agreed upon at ¥140,000,000. (See Appendix.)

(3) Dispute with Outer Mongolia. Of all the disputes which Manchoukuo has been experiencing the most complicated one was the Halha affair which took place on the frontier with Outer Mongolia.

On January 24, 1935, the troops of Outer Mongolia passed over the Manchoukuo-Outer Mongolia frontier on the east side of Lake Buir, and clashed with the garrison of Manchoukuo. Hulha is a strategic point on the Manchoukuo-Outer Mongolia frontier. Outer Mongolia is a territory of the republic formed by the Mongolian people, which is under control of Soviet Russia. The door of the republic is opened only to Russia, it being closed not only to Manchoukuo, but also to China, which formerly had sovereignty over it.

The delegates of the two countries began to hold conference on June 1, 1935 at Manchuli to settle the affair and also to establish a frontier line between the two countries. The delegates held more than ten sessions covering two months, but still have not come to any satisfactory agreement (August 15, 1935).

(4) Committee on Frontier Disputes between Manchoukuo and the U.S.S.R. In view of almost endless disputes occurring at the frontier

Digitized by Google

regions between Manchoukuo and the U.S.S.R., the Japanese Minister of Foreign Affairs, Mr. K. Hirota, proposed to Ambassador Yuoreneff of the U.S.S.R. at Tokyo to establish a joint commission for the settlement of questions arising in the frontier between Japan, Manchoukuo and the U.S.S.R. The proposition is expected to materialize in the near future.

With Great Britain and the U. S. A. The Manchoukuo Government has decided to make the Petroleum Monopoly Law effective as from April 10, 1935. The governments of Great Britain and America protested against Japan stating that the above law infringes the principles of the Open Door and Equal Opportunity established by the Nine-Power Treaty. The Japanese Government replied that it is an independent action of the state of Manchoukuo, and that Japan can do nothing with it. The reason of the protest of the British and American Governments is that the capital invested in petroleum in Manchoukuo by their nationals would be practically expelled from the country by coming into force of this law. But the Manchoukuo Government had to issue this law to effectuate the control of its principal industries which are absolutely necessary for her development, with no aim to expel foreign capitals.

With China Manchoukuo, when she proclaimed her independence on March 1, 1932, notified China that her relation with the latter would be the same as with any other power, and declared that she would take over the business of postal service on the 20th of the same month. The country made new stamps and post cards, and had actually taken over the postal business on July 25, 1932. As to the collection of customs duties, the business was also taken over by the Manchoukuo Government on September 25.

The question of railway, which was another important problem, came to a satisfactory solution on June 28, 1934, and the railway connection which was severed for 2 years and 9 months since the occurrence of the Manchurian Incident has been restored. Since July 1, 1934, one train each from Peiping and Mukden is being despatched every day.

Recognition by Salvador On March 3rd, 1934, the Republic of Salvador declared that she would recognize Manchoukuo as an independent state.

With the Holy See Under date of April 18, 1934, the Holy See notified the Manchoukuo Government of its decision to form a separate mission field in Manchoukuo, independent from that of China, and appointed the Rt. Rev. Bishop A. Gaspais as Acting Apostolic Delegate in Manchoukuo. This notice, originally given to the Manchoukuo Government by Bishop Gaspais, was confirmed on August of the same year by an official communication from His Eminence Pierre Cardinal Fumasoni-Biondi, prefet de la S. Congregation de la Propagande. At the same time, His Eminence in his communication to the Manchoukuo Foreign Minister stated that the Catholic missions in Manchoukuo would gladly contribute to the moral and intellectual development of the country according to the disposition of the Manchoukuo authorities.

Passport Visé Meanwhile, the Department of Foreign Affairs of Manchoukuo assiduously endeavoured to pave the way for the opening of diplomatic relations with European and American countries, and promulgated new regulations governing the granting of passports and their visés effective June 1, 1933, and otherwise took steps to provide travelling facilities for foreigners.

Digitized by Google

Simultaneously with the enforcement of the new regulations, the Manchoukuo Foreign Office opened four passport offices in Antung, Dairen, Yingkow and Suifeng on June 1 to which Shanghai-kwan, Manchuli, Tumen, Heiho and Kupeikou were added later, pursuant to the stipulations of the said regulation. Between June 1, 1933 and September 30, 1934, a total of 11,395 passports of foreigners entering or passing through the country were examined and viséd, an average of 950 a month.

Manchoukuo Consulates Another event worth mentioning in connection with Manchoukuo's foreign relations was the opening of the Manchoukuo consulate at Blagoveschenk, the first consulate to be established in a foreign country by the new nation, late in September, 1932. Mr. Kuei Heng-chin was appointed in charge of this consulate.

The number of Manchoukuo residents in Blagoveschensk, which is a Soviet city located near the Siberian border on the bank of the Amur River on the opposite side to Heiho, a Manchoukuo town, is approximately 7,000, most of them being engaged in the retail business.

Manchoukuo's second consulate in Soviet Russia was opened at Chita in January, 1933, the staff being headed by Mr. Li Yuan as consul.

Also the consulate at Shingishu, Korea, the first of the kind to be established on the Japanese Empire, was opened on November 9, 1934.

Exchange of Ambassadors The recognition of Manchoukuo by Japan on September 15, 1932 was acknowledged by the dispatch of Pao Kuancheng to Japan by the Manchoukuo Government, to stay in Tokyo as Manchoukuo's representative, towards the end of the same month, and later by the visit to Tokyo by the Foreign Minister of Manchoutikuo, Hsieh Chieh-shih, in November, 1932.

Meanwhile General Nobuyoshi Muto, commander of the Kwantung army, ambassador to Manchoukuo and governor of the Kwantung Leased Territory, who signed the Japan-Manchoukuo Protocol on September 15, 1932, presented his credentials as ambassador to the Chief Executive of the country.

This was followed by the arrival of General Ting Shih-yuan on May 10 in Tokyo as the first Manchoukuo Minister to Japan. Meanwhile Manchoukuo desired to elevate the legation at Tokyo to the status of embassy in view of increasing importance in relation with Japan, which was endorsed by Japan on May 21, 1935. The first ambassador of Manchoukuo to Japan is Mr. Hsieh Chieh-shih, the former Minister of Foreign Affairs.

Shortly after the conclusion of Jehol expedition, Marshal Muto, to which rank he was promoted, fell ill in Hsinking and died on July 27. He was succeeded at his post by General Takashi Hishikari. General Hishikari retired from his post on December 10, 1934, and was succeeded by General Jiro Minami.

Diplomatic Representations Japan is the only nation which has an embassy in Manchoukuo. Consulates established by Japan and other powers in the country and their locations follow:

Finance

While the finance under Chang Tso-ling was comparatively sound in his earlier administration, the expenditure commenced to increase steadily due to his army enlarged in latter days. Thus in 1926, the total expenditure was ¥120,000,000 and showed a budgetary deficit of ¥12,000,000. When he was succeeded by his son, Chang Hsueh-liang, the deficit was further increased. The recklessness of his finance was evidenced by the fact that, of the total expenditure of ¥142,500,000, the sum defrayed for the military purpose amounted to ¥114,720,000. The deficit thus created was met by the increased tax and inflation of currency, causing thereby great miseries of the people.

In view of the deplorable state of affairs, as above stated, the leaders of Manchoukuo directed their efforts for the stabilization of the financial conditions of the country without increasing tax and economic pressure on the people. It is much to the credit of the new state that such a rapid and sound development has been made in finance and currency in so short a time.

Manchoukuo's national budgets since its foundation follow:

MANCHOUKUO'S NATIONAL BUDGET

(in M¥ 1,000)

Fiscal years	Revenue			Expenditure		
	Ordinary	Extra-ordinary	Total	Ordinary	Extra-ordinary	Total
1932-33	97,386	15,922	113,308	104,482	8,826	113,308
1933-34	132,134	17,035	149,169	107,449	41,720	149,169
1934-35	163,321	25,404	188,725	131,662	57,063	188,725

Fiscal year runs from July to June.

Army Clothing Factory	7,296,771	7,297,189
Arsenal	7,000,000	7,000,000
Dept. of Finance		
Monopoly Bureau	25,724,000	21,158,872
Kirin-Heilungkiang Salt Transportation Office	17,310,277	13,323,223
State Properties Adjustment Fund	4,645,050	4,491,922
Investments	12,120,680	12,120,680
Dept. of Communications Postal Administration	3,503,451	3,503,451
Total	136,434,133	126,956,705
General Account	188,725,058	188,725,058
Grand Total	325,159,191	315,681,763

The budget for general account amounts to M¥188,725,058, representing an increase of M¥39,555,880 over that of the previous year. Figures of the special accounts are revenue, M¥136,434,133, and expenditure, M¥126,956,705, as compared with M¥106,945,834, the figure for both revenue and expenditure for the preceding year.

Among the sources of revenue it is estimated that receipts from customs duties will total M¥72,638,107, or 51 per cent. of the total income from duties and taxes. Compared with the estimated total revenue from the same source for the previous year, the above sum shows an increase of M¥22,857,089 or 45 per cent. The growth in customs receipts is anticipated in view of the country's expanding foreign trade, the improving domestic economic condition, and the reduction of smuggling through the improvement of the customs system.

A growth of M¥11,038,909 over the previous year is anticipated in the internal revenue which is estimated at M¥46,221,480. The economic development of the country and the improvement of the tax-collecting system through the restoration of peace and order are given as reasons for this anticipated increase.

All departmental budgets, with the exception of the Finance Department, show considerable increases. The most conspicuous is that of the Department of Education whose expenditure is estimated at M¥6,114,268, as compared with M¥931,102 for the previous year. The Department of Civil Affairs gained M¥8,000,000, the General Affairs Board, about M¥6,000,000, the Department of Defence, M¥16,300,000, and the Department of Industry, an increase of about M¥1,800,000 over the previous year.

The Government has incorporated in its social and industrial policies a system of gradual reduction of internal taxes and readjustment of various other duties and levies. Besides the unification of business taxes and readjustment of the foodstuff tax, the Government has effected the revision or the abolition of some ten different taxes, relieving the people of tax burdens amounting to about M¥26,000,000. In view of the importance of salt in the daily life of the people, the authorities have lowered the price of this commodity by M¥0.30 per picul since March, 1934. The old Import and Export Tariff rates have also been revised.

Government Monopolies As a means of lightening the tax burdens of the people and to suppress the smuggling of salt in the Korean border districts, the Government, since September, 1933, has reduced the price of salt in the Chientao district by sums ranging from M¥2.20 to

Digitized by Google

M¥3.55 per picul. For the relief of the inhabitants of Kirin and Heilungkiang provinces who suffered greatly during the old régime, the authorities have cut down the salt tax and salt price by M¥1.00 per picul since March, 1934, although this has resulted in the decrease of the monopoly profits by M¥1,100,000.

The opium monopoly system has been instituted for the purpose of eliminating the evil practice of opium-smoking and controlling the smuggling of opium and the cultivation of poppy. The profits from the monopoly are set aside to cover the expenditures for the control, relief and education of the opium addicts.

National Loans and Sinking Fund Although the Government makes it a point not to float loans to cover any revenue deficit, the following national loans have been raised since the founding of the new régime:

1.	State Founding Loan	G¥30,000,000
2.	Bank of Chosen Loan	20,000,000
3.	Local Municipal Construction Loans	10,000,000
	Total	60,000,000
1.	Capital Construction Loan	M¥ 5,000,000
2.	Opium Monopoly Fund	2,600,000
3.	Central Bank of Manchou Loss Compensation Loan	33,000,000
4.	Old Foreign Claims Liquidation Fund	5,147,950
5.	Shing-hai, Hu-hai, Tsi-ku Railways Expropriation Fund	11,928,000
6.	Bonus to Customs staff	3,504,070
7.	State Founding Loan (Central Bank shares)	7,500,000
8.	North Manchuria Special District Loan, etc.	1,140,000
	Total	M¥69,820,020

In conformity with the practice of preserving international good faith the Government has put aside a special sinking fund to meet its due share of foreign loans secured on the Chinese Maritime Customs and Salt Gabelle as follows:

1932	M¥13,386,192
1933	8,512,562
Total	21,898,754

Furthermore, the Government has since the 1933 fiscal year put aside a sum equivalent to ten per cent. of the surplus of annual revenues as a sinking fund to cover the national loans in general. This fund at present totals M¥1,758,600.

Banking

General Prior to the founding of Manchoukuo and under the régime of the Chang family each of the Three Eastern Provinces had its central bank. Each of them took advantage of its note issuing power conferred on it. Especially the central bank in Fengtien province was almost reckless in the issue of paper money, the amount it issued in 1929 for providing funds for military purpose reaching M¥1,500,000,000 with the resultant slump of the value of the paper money to one seventieth of its worth. The new government, therefore, aimed at the effective control and stabilization of the currency. It enacted laws for this purpose, adopted the silver standard, as this system suits more to the character of the country, and established the Central Bank of Manchou.

Central Bank of Manchou This bank was established on July 1, 1932, and it opened business on the same day. In it were included four old banks of issue, the Three Eastern Provinces and the Frontier Bank. It has its head office at Hsinking, and branch offices at Mukden, Kirin, Tsitsihar and Harbin. It is capitalized at M¥30,000,000, and Manchoukuo government hold more than 50,000 shares of M¥100 each. It is authorized to mint coins and issue notes.

The balance statement of the Central Bank of Manchou as at the close of business, December 31st, 1934, follows:

2. Reserve for dividend	25,000.00
3. Special reserve	180,000.00
4. Bonus for executives	35,000.00
5. Dividend for shareholders (6% per annum)	450,000.00
6. Balance carried forward	295,000.00

Currency Problem The currency in Manchoukuo has been in an extremely complicated condition, native and Japanese and other notes and coins being in circulation. But in the newly regulated system of currency of Manchoukuo, 23.91 grammes of silver is taken as the unit called the yuan, there being 100 fen or 1,000 li in one yuan. The new paper notes are issued in five different denominations of 100 yuan, 10 yuan, 5 yuan, one yuan and chian, or 50 fen, circulated together with 1-chiao and 5 fen nickels and 1-fen and 5-li coppers.

Note Issue Before opening for business on July 1, 1932, the Central Bank of Manchou took over old notes of 15 different kinds and 136 denominations amounting to M¥142,234,872.34 calculated in the new currency at the exchange rate fixed officially. This figure was gradually reduced and by the end of June, 1934, M¥132,400,000 or 93 per cent. had been redeemed by the Bank. The amount of the notes in circulation at present reaches M¥130,000,000.

Other Banking Institutions Though the Central Bank of Manchou occupies the controlling position in the monetary market as the note issuing bank, there are other banks which do substantial banking business. The names and capitalizations of the principal banks follow:

Name	Authorized Capital
(1) Manchoukuo Banks	
Fntien Commercial and Industrial Bank	M¥2,200,000
Fentien Commercial Bank	1,000,000
Yingkow " "	1,000,000
Kung Cheng Yu Bank	500,000
Tungpien Industrial Bank	1,500,000
I Fa Bank	1,000,000
I Tung Commercial Bank	1,000,000
Hui Hua Bank	250,000
(2) Japanese Banks	
Yokohama Specie Bank	¥100,000,000
Bank of Chosen	400,000,000
Shoryu Bank	12,000,000
Manshu Bank	10,000,000
(3) Chinese Banks	
	Hsien Tayang
Central Bank of China	25,000,000
Bank of Communication	10,000,000
Chin Cheng Bank	10,000,000
Ta Chung Bank	4,000,000

Digitized by Google

(4) Other Foreign Banks	
Russo-Asiatic Bank	R65,000,000
The Far Eastern Bank	$5,000,000
Hongkong Shanghai Banking Corp'n	$5,000,000
National City Bank of New York	$150,000,000
The Chartered Bank of India, Australia & China	£3,000,000

To aid the sound development and proper control of banking, the Government promulgated a new Banking Law in November, 1933.

Encouraged by the favourable results of the two credit associations which were created in 1932 in Fengtien province, one each in Shenyang and Fu districts, to aid the rural communities, the Finance authorities in 1933 inaugurated eight similar associations in Fengtien, two in Kirin and one in Heilungkiang provinces, and are at present making preparations for the establishment of 40 during 1934.

Foreign Investments

General The foreign investments in Manchoukuo, in 1933 amount to ¥2,063,850,000 distributed among the various countries as follows, according to the statistics compiled by the South Manchuria Railway Company:

Country	Amount of Investments	Percentage
Japan	¥1,510,755,000	73.201
Russia	465,051,000	22.531
Great Britain	39,590,000	1.918
United States	26,400,000	1.279
France	21,086,000	1.022
Sweden	850,000	0.041
Denmark	157,000	0.008
Total	2,063,880,000	100.000

Japanese Investments The distribution among various industries of the Japanese investments in Manchoukuo is tabulated by the South Manchuria Railway Company as follows:

Items	Amount Invested	Percentage
Railways	¥356,316,000	24.00
Harbours	63,834,000	4.00
Transportation	28,086,000	2.00
Agriculture, mining, and forestry	241,045,000	16.00
Manufacturing	110,121,000	7.00
Commerce	117,758,000	8.00
Electric and gas industries	37,283,000	2.50
Banking	106,705,000	7.00
Finance and trust	97,634,000	6.50
Public utilities	302,569,000	20.00
Miscellaneous	49,453,000	3.00
Total	1,510,755,000	100.00

Foreign Trade

Manchuria was first opened to foreign trade in 1862, when Yingkow was opened as a commercial port. This port lost its former prosperity when Russia made Dalny (Dairen) a free port and built a railway between Harbin and Dalny.

Dairen became the greatest port of export for Manchurian products after completion of its harbour facilities. The rebuilding of the Antung-Mukden Railway and the construction of the bridge spanning the Yalu River have made possible the recent development of Antung as a commercial port.

A noteworthy feature of Manchoukuo's foreign trade during the 20 years or so up to 1930 was the annual excess of exports, ranging from several tens of million hk. tls. to 100,000,000 hk. tls. or more. These features have completely changed since the world depression which started in 1930 and the establishment of Manchoukuo which followed the Manchurian Incident. Imports began to increase at an unprecedented rate due to the huge demand for building materials required for the construction projects throughout the country. Imports continued to surpass exports at such a rapid pace that in 1933 Manchoukuo's foreign trade finally registered an import excess of M¥90,000,000, which fur-

Digitized by Google

ther increased to M¥145,000,000 in 1934, and thus completely reversed the former tendency. It is believed that this new trend will continue for quite a long time, as imports will in all probability continue to grow with the development of industry and commerce.

As staple exports of Manchoukuo soy beans, bean oil, kaoliang, wheat, wild silk, coal and lumber are the best known. Among the import are cotton fabric, cotton yarn, sugar, tobacco, petroleum, iron, steel, machinery and paper. The growth of the foreign trade of Manchoukuo is illustrated in the following table :

Year	Imports	Exports	Total
	(In 1,000 Haikwan Tls.)		
1907	35,516	24,421	59,929
(Average of 5 years 1907–1912)	73,528	74,590	148,119
1917	158,562	161,120	319,682
1927	268,913	408,036	676,949
1928	302,956	434,035	736,991
1929	329,603	425,651	755,255
1930	306,999	396,714	703,713
1931	(in M¥1,000) 323,975	693,903	1,017,878
1932	301,068	616,152	917,220
1933	514,540	423,325	937,867
1934	592,562	448,426	1,041,988

The decrease in the amount of exports and imports in 1932 is due to the Manchurian Incident.

Among the countries trading with Manchoukuo, Japan by far occupies the most conspicuous position as may be seen from the following table which shows Manchoukuo's foreign trade since 1931 with various countries :

FOREIGN TRADE OF MANCHOUKUO BY COUNTRIES

Exports (in M¥1,000)

Countries	1931	1932	1933	1934

Agriculture

General The vast plains of Manchuria consist for the most part of agricultural land, covered with fertile soil or humus, and agriculture has always been the main occupation of the people of Manchuria. The recent development of transport facilities has encouraged the coming of immigrants in large numbers from China, especially from Shantung province. Undeveloped land is being thus brought under cultivation, and every year sees some increase in the total amount of farming products. Unfortunately, these immigrants possess neither scientific knowledge nor capital, and, as they still follow primitive methods of cultivation, the productiveness of the land is not yet fully exploited. The wide plains that characterize the country invite the use of machinery for large-scale cultivation, and if capital and technical skill were applied, their agricultural products could certainly be multiplied manifold. One novel feature of the agriculture in Manchoukuo is that Korean farmers who migrated there are doing a large share of work.

Cultivated Area The plains along the lower Liao River, the upper and middle Sungari River, and the Hurka River are most fertile and constitute the main agricultural territory of Manchoukuo. Next come the lands in the centre or Heilungkiang province and along the lower reaches of the Sungari. These districts have been developed with an astonishing rapidity by the Chinese immigrants from Shantung and Hopei.

At the end of 1931 the area under cultivation totalled 13,733,000 hectares, an increase of 876,000 since 1929. In 1932, however, due to the outbreak of the Manchurian Incident and by a devastating flood in North Manchuria, the area decreased by 300,000 hectares. A further decrease of 170,000 hectares was witnessed in 1933, partly due to floods in North Manchuria but more to a great decrease of the exports of soy beans to European countries and consequent fall in the prices of agricultural products in general.

A decline in 1934 in agricultural prices, together with the plight of farmers in the North probably would contract the area under cultivation. Possibilities, however, for the future extension of farm areas are abundant inasmuch as more than 50 per cent. of Manchoukuo's arable land is yet uncultivated.

The area of arable land in Manchoukuo since 1929 follows :

AREA OF CULTIVATED LAND IN MANCHURIA

(Unit in hectare)

Year	South Manchuria	North Manchuria	Total
1929	6,232,720	6,634,080	12,866,800
1930	6,529,200	6,858,230	13,387,430
1931	6,582,600	7,150,650	13,733,250
1932	6,263,840	7,150,650	13,414,490
1933	6,299,750	6,941,490	13,241,240

Principal Crops The total tonnage of the agricultural products of Manchoukuo for the year 1933 was 18,477,000 tons. Production of principal agricultural crops since 1929 follows :

Kwantung Leased Territory and the S.M.R. Zone excluded.
1933 and 1934 figures are estimates.

Thus the country has an abundant supply of food to feed the people, which now roughly numbers 30,000,000. The surplus of crops is exported every year the total amount of which in 1932 was M¥211,562,000, and in 1934 M¥244,282,000. The quantity and value of agricultural products which were exported during 1931-1933 follow:

EXPORTS OF AGRICULTURAL PRODUCTS, 1931-1933

Soy Beans Manchoukuo produces about 60 per cent. of the total production of soy beans in the world. The beans contain about 10 per cent. of oil, and the cake which is obtained in pressing the beans is exported as fertilizer. The latest figure for production of soy beans in Manchoukuo was 5,200,000 metric tons and its total plantation area 4,000,000 hectares. The average crop per hectare was 1,300 kg.

Kaoliang Kaoliang comes next in importance to soy beans. It serves as the diet of the people. Its production in 1933 was 4,681,500 metric tons, and the area planted reached 2,965,000 hectares. The average crop per hectare is 1,240 kg. It grows more in the southern districts than in

Digitized by Google

the northern part of Manchoukuo, and its export to Japan and China is increasing in recent years.

Millet The yield of this crop reached 3,352,000 metric tons in 1933 and its area of plantation 2,132,000 hectares. The average yield per hectare is 1,570 kg.

Wheat The northern districts of Manchoukuo are better suited than the southern part for wheat. The production reached 1,302,000 metric tons in 1933, more than one-half of which was consumed in the country as raw material for flour.

Paddy-field Rice Rice grown in paddy-fields is of comparatively recent origin in Manchoukuo. But the climate and soil of Manchoukuo are well adapted for this method of growing rice. Though the area of paddy-fields in 1933 was but 88,000 hectares and the yield 136,000 metric tons, it is not difficult to make it ten times as large both in area and yield.

Maize The product reaches 870,000 metric tons, its area of plantation about 876,000 hectares. It is mostly consumed within the country.

Special Crops In addition to the above-mentioned crops, the soil of Manchoukuo is well adapted to cotton, tobacco, hemp, ground-nuts, fruits, etc. The plantation area of cotton totals 50,000 hectares, while its production is estimated to be about 20,000,000 kin. Tobacco is produced in Kirin and Fengtien provinces, and its production is estimated at 7,800,000 kwan a year. The production of tusser silk in Manchoukuo is a hundred years old, and it has now become one of the principal staple products in the country. Its production in Fengtien province alone reaches about ¥11,000,000 in value.

Live Stock Raising of domestic animals is indispensable to Manchoukuo's agricultural system, as they serve well for the daily life of the farmer as well as for transport purpose. They are widely spread and almost every family raises some kind of them. Farm wastes are utilized for feeding them, while their excrements are used as fertilizer, and ploughing, stamping, harrowing, manuring, transporting and threshing, etc. are carried out with their help. The number and principal kinds of live stock follow:

NUMBER OF LIVE STOCK IN 1933

Kinds	Fentieng Prov.	Kirin Prov.	Heilungkiang Prov.	Jehol Prov.	Total
Cattle	516,670	429,950	658,650	201,710	1,806,980
Horses	669,220	735,070	1,033,700	616,080	3,054,707
Mules	321,530	269,250	151,920	—	742,700
Donkeys	349,330	83,410	46,000	117,460	596,200
Sheep	518,200	182,430	1,939,930	594,850	3,235,410
Hogs	3,444,030	2,273,760	1,789,400	457,300	7,964,490
Grand total	5,818,980	3,973,870	5,619,600	1,987,400	17,399,850

Wools and Hides Sheep are raised for the purpose of getting meat, but not for wools. Wools obtained from them are very coarse. They are not good for woollen cloth making, and are therefore used only as carpet wools. The amount of wools produced is estimated to be about 9,000,000 lbs. a year.

As meat is of universal demand in Manchoukuo, the number of live stock slaughtered every year is very large. Owing to the lack of accurate statistics, the number actually

Digitized by Google

slaughtered is not known, but the production of hides is estimated to be 450,000 from cattle, 2,000,000 from sheep, and 380,000 from mules and donkeys. But there is no tannery which is equipped with modern machinery to put a good finish to the hides, though a large number of hides is exported every year.

Forestry

General The total forest area in Manchoukuo is estimated to be about 358,684 sq. km. which is equal to about 36 per cent. of the entire area of the country, and the volume of standing timber about 15,000,000,000 koku. Investigation conducted by the Manchoukuo Government, however, shows that the deforestation seems to have been done in a reckless manner in the past and the real volume of the standing timber may perhaps be about 9,000,000,000 koku. Standing timber in Manchoukuo follows :

STANDING TIMBER IN MANCHOUKUO

Districts	Estimated Standing Timber in 1,000 koku	Principal Species of Timber
Right Bank of the Yalu and the Hunho valley	276,635	Korean pine, Korean fir, Korean larch, silver-fir, maple, birch, oak, ash, Doronoki.
Sungari valley	874,036	
Tumen valley	420,401	Korean pine, fir, spruce, larch, lime, oak, elm, ash, birch.
Hurka valley	420,951	
Lalin valley	300,490	
North Manchuria Railway Eastern Line District	898,296	Korean pine, fir, spruce, maple, birch, Doronoki, Siberian cork-tree, Manchurian walnut.
Sansing district	2,615,302	Korean pine, fir, spruce, Siberian cork-tree, ash, birch, oak, lime.
Great Khingan Range	5,600,000	Larch, Japanese birch, Siberian red
Little Khingan "	3,500,000	pine, willow, alder.
Total	14,906,11	

For the purpose of preserving forests and securing their rational management, the authorities of the new régime have stopped granting fresh forest concessions and have commenced to classify forests into three categories, viz., State, public, and private, under a three-year programme. At the outset the authorities took over the various forests of the Central Bank in Kirin province as State forests, for which purpose a sum of M¥2,000,000 was appropriated in the 1933 supplementary budget. The forestry offices established in 1933 at Chiacho, Tunhua, Yenki, Wuchang and Peianchen and the branch office at Hailar, have been entrusted with the rational management of State forests and the improvement of forestry. Some 15 other forestry offices will also be established in various other districts during 1934-1935. A five-year programme for the investigation of forests by means of aerial photography is also being worked out. It is expected that with the progress of the forest investigations and the enactment of new forest laws and regulations, the most scientific and up-to-date management of forests will become possible in the near future. A pulp manufacturing plant will probably be put up as soon as conditions warrant it.

Species of Timber In Manchuria there are as many as 300 species of timber, but the more common species are the following:

Evergreen: Korean pine, silver fir, Korean fir, spruce, larch.

Deciduous: Korean oaks, birch, Amur lime tree, ash, elm, willow.

The proportion of evergreen to deciduous is 4 to 6, and in the evergreen the Korean pine constitutes more than half of the total.

Lumber Industry Lumber industry is carried on in the districts of Antung, Kirin and Harbin, but that in Antung districts is best known. Production of lumber in Manchoukuo runs from 2,000,000 to 4,000,000 koku a year. Owing to activities in buildings and public works in Manchoukuo, the domestic product is not enough to meet the demand, and large quantities of lumber are being imported. The production of lumber during 1926-1932 follows:

LUMBER PRODUCTION IN MANCHOUKUO
(in 1,000 koku)

Year	Yalu Lumber	Kirin Lumber	Chientao and Junchun Lumber	North Manchurian Lumber	Total
1926	1,247	451	218	1,459	3,376
1927	1,919	580	336	1,048	3,885
1928	1,412	997	478	2,230	5,118
1929	948	1,042	370	1,484	3,846
1930	882	1,015	267	922	3,087
1931	1,458	983	320	505	3,268
1932	1,218	741	249	623	2,833

Fisheries

General In spite of the largeness of area, the coast line of Manchoukuo is comparatively short, its total length being only 855 kilometres. Moreover, the coast is made up of shallow bays, which readily get frozen in winter, and is not therefore favourable for fisheries. The amount of catches is valued only at about ¥5,000,000 a year. Figures for 1931-1933 are as follows:

Year	Amount of Catches in 1,000 kwan	Value in ¥1,000
1931	9,387	3,151
1932	11,171	4,104
1933	12,992	5,023

Fresh Water Fishery Fresh water fishes are abundantly found in the Sungari, the Nonni, the Mutankiang, the Ussuri, the Amur and the Liao Rivers as well as Lake Hu-jun-ti, Pei-erh-ih, etc. The amount of catches in 1932 follows:

CATCHES OF FRESH WATER FISHES

River or Lake where Caught	Amount of Catches in kin	Value in yen
Sungari River	6,000,000	650,000
Nonni „	18,600,000	1,860,000
Hujunti Lake	5,100,000	400,000
Argun River, Amur „, Ussuri „	1,000,000	100,000
Yalu River, Liao „	1,560,000	120,000

Salt Industry The coast line of Manchoukuo stretches only for 855 km. which is but one-eleventh of the entire border line of the coun-

Digitized by Google

try. However, the coast on the Yellow Sea and the Po-hai has very little rainfall and as the evaporation is very rapid and the air dry, the district is well adapted for salt manufacturing by evaporation. The total area of salt fields now reaches 21,200,000 tsubo and the total annual production 400,000,000 kin, which may be tripled or quadrupled if the salt fields are extended. The annual output and export of salt in 1932 were 3,700,856 piculs and 481,000 piculs respectively, while the same in 1933 were 5,106,293 piculs and 990,000 piculs. The consumption of salt in the country during 1933 totalled 3,463,130 piculs, while the total amount of salt exports to Japan was somthing like, 1,500,000 piculs during 1934. The area of the salt fields in 1932 follows:

THE AREA OF SALT FIELDS AND SALT PRODUCTION

Districts	No. of Salt-fields	Area of Salt-fields tsubo
Ryojun (Port Arthur)	104	3,394,582
Dairen	3	129,899
Chinchou	9	244,499
Pulantien	147	8,531,101
Pitzuwo	261	8,891,274

With the object of increasing the production of salt, improvement of its quality, and the lowering of its price, the authorities have stationed experts at various salt-fields to undertake the improvement of the fields and the manufacturing process. At the same time, the Government is conducting an investigation of promising salt-fiields. Thus, it will not be difficult to double the present yield with a corresponding increase in exports before long.

Mining Industry

General Numerous kinds of minerals are found in Manchoukuo, of which iron, gold, coal, magnesite, fireclay, and shale oil are most abundant. The production of the principal minerals in Manchoukuo and a brief account of a few of them follow.

PRINCIPAL MINERAL PRODUCTS OF MANCHOUKUO

(in metric tons)

Kind of Minerals	1928	1929	1930	1931	1932
Iron ore	710,286	985,671	832,228	922,649	936,143
Pig iron	283,667	294,156	348,054	342,270	368,181
Iron sulphide	4,266	5,057	3,028	3,919	3,620
Lead ore	366	1,450	—	—	—
Manganese ore	444	723	609	270	60
Copper ore	—	750	840	—	—
Coal	9,509,563	9,893,594	10,048,652	9,048,703	7,108,282
Coke	343,741	388,807	485,312	418,625	416,306
Shale oil	—	—	981,004	1,245,094	1,412,554
Crude oil	—	—	47,815	61,081	70,631
Magnesite	25,454	31,681	29,016	36,034	55,386
Dolomite	471,710	629,502	688,489	545,131	477,350
Fire-clay	60,481	68,651	53,664	35,476	51,799

Iron Iron and coal constitute the two most important minerals in Manchoukuo. Iron deposits are mostly found in Fengtien province, especial-

Digitized by Google

ly in Anshan and Miaoerhkou, ores coming from these deposits being turned into pig iron in Anshan and Penhsihu iron works. The estimated iron deposit is about 1,080,000,000 metric tons, of which, however, the deposit containing more than 50 per cent. iron is less than one-half of one per cent. The ore is mostly hematite and magnetite, and is not of good quality.

Coal Coal is even more important than iron. The estimated coal deposit in Manchoukuo is 4,804,000,000 metric tons, and its production in 1933 was about 9,000,000 metric tons. The production of coal in various provinces follows (in 1,000 metric tons) :

Province	1922	1927	1928	1929	1930	1931	1932
Fengtien	4,508	8,800	8,259	8,569	8,794	7,506	6,750
Kirin	25	373	474	570	523	530	218
Heilungkiang	—	170	100	120	170	300	95
Jehol	66	324	405	445	544	691	45
Hsingan	—	240	270	188	7	20	—
Total	4,600	9,908	9,509	9,893	10,040	9,048	7,108

Fushun Coal Field The Fushun coal field is the most famous in Manchoukuo. The right of mining this coal was transferred to Japan by Russia as a result of the Russo-Japanese War, and since 1907 the mining has been under the management of the South Manchuria Railway Co. The average thickness of the coal seam is 40 metres, the thickest part of the seam reaching 130 metres. The estimated deposit of coal is put at 950,000,000 metric tons. The coal is bituminous, and its characteristics are a large content of volatic matter, a small quantity of ash, and generally a large amount of nitrogen. When the mine was transferred to Japan, the daily output was 300 metric tons, which in 1933 was increased to about 9,000,000 metric tons a year. The annual production of the coal field since 1910 follows :

Year	Production in metric tons	Year	Production in metric tons
1910	913,669	1928	6,900,233
1920	3,213,665	1929	6,785,000
1925	5,844,478	1930	6,864,100
1926	6,591,908	1931	6,114,700
1927	7,030,198		

Shale Oil This is a layer of brown rock which covers the coal bed at Fushun to the thickness of about 400 feet. The rock contains oil. This rock deposit is estimated at 4,400,000,000 metric tons, and its oil content at about 6 per cent., the crude oil of more than 300,000,000 metric tons may be obtained from it. The South Manchuria Railway Co. started early to utilize the rock, and established an oil mill at Fushun. The company is now obtaining more than 54,000 metric tons of the crude oil through dry distillation method, and also along with it paraffin, ammonium sulphate and coke.

In addition to the above, there are gold, silver, lead, etc., the gold deposit being estimated at ¥5,000,000,000. Also magnesite produced near Ta Shih Chiao and fireclay produced in Yen Tai and Pen Hsi Hu deserve a serious consideration. Light metal producing companies which use these products as raw materials are being organized.

Manchoukuo has such vast mineral

Digitized by Google

resources as above stated. Since most of these products are very important for national defence, coal, gold and petroleum industries will be managed by special corporation under the Government supervision. With this in view, the Government has established the Manchuria Petroleum Co., Ltd., the Manchuria Coal Mining Co., and the Manchuria Gold Mining Co., for the investigation, management, and exploitation of these mines. As regards other minerals, permits for mining will be given out with the promulgation of new mining law.

Conforming to the general policy of recognizing the validity of mining concessions obtained under the old régime as well as of the mining applications filled up to the present since the founding of the new State, provided they do not conflict with existing laws and regulations, the Government is examining the old concessions permits and studying the actual conditions of the various mines.

The Government is considering the establishment of a gold refinery, a fuel research institute, a mineral laboratory, and a mineral products museum, all under State management, to assist and encourage private mining enterprises, secure good markets so that their products may be turned into cash promptly, and in general to contribute to the development of the mining industries.

Manufacturing Industries

General In spite of the abundant supplies of various raw materials and cheap labour, the industry in Manchoukuo is not yet in an advanced stage. This was particularly the case before the advent of Japanese into the country, owing to the undeveloped state of transport and the backward condition of most regions. At present industries have developed in the Kwantung Leased Territory and the South Manchuria Railway Zone. The number of mills of the more important industries, the number of labourers, the amount of capital invested and the amount of production follow:

NO. OF FACTORIES, LABOURERS, CAPITAL AND PRODUCTION

Classified by Industries in 1932

Kind of Industry	No. of Mills	No. of Factories	Amount Invested in Yen	Amount of Production in Yen
Cotton	83	9,621	19,565,787	17,401,310
Metallic	94	1,694	2,333,732	2,399,263
Machinery	109	9,909	18,090,015	14,914,498
Ceramic	123	7,114	15,921,687	4,453,356
Chemical	167	11,021	43,543,175	83,763,325
Sawing	85	2,832	3,411,279	7,336,147
Printing and binding	70	2,405	4,150,334	2,757,007
Provisions	249	6,821	24,613,947	23,258,256
Gas and electricity	5	567	10,014,916	2,090,735
Others	152	4,152	5,313,380	6,689,907

Oil Industry Making of soy bean oil and bean cake by pressing the soy beans early developed in Manchoukuo. With almost limitless supplies of soy beans, the industry advanced from mere handicraft work into the modern advanced industry as soon as the real worth of bean oil and bean cake was recognized. The bean oil and bean cake produced in this way constitute the most important items for export. The prosperity of Manchoukuo largely depends on this industry. The number of oil mills and their production for 1931 and exports of these articles for 1932-1934 follow:

Textile Industry Tusser silk is another export article next only to bean oil in importance. With the increased demand for pongees in Europe and America, the Japanese silk weavers in Fukui, Gifu and Kyoto prefectures began weaving them and the demand for this silk comes from these prefectures in Japan. The reeling is carried on by the Chinese farmers as a side line, and necessarily on the household basis. The production is largest in Antung. In 1932 it was M¥9,775,000, in 1933 M¥9,555,000 and in 1934 M¥7,408,000. About 70 per cent. of the total export goes to Japan.

Of the total population of 30,000,000 in Manchoukuo, about 90 per cent. wear cotton clothes. Therefore, from ancient times, there existed in Manchoukuo small, primitive plants for cotton weaving, but no large modern factories rose before the Great War. The establishment of the Cotton Spinning and Weaving Plant by Chinese at Mukden was followed by the establishment of three companies by Japanese, viz.: the Manchurian Cotton Spinning Company, the Chinchou Factory of the Naigai Spinning Company, and the Manchuria Fufang Company. The total number of mills in 1932 was 83, the number of labourers 9,621, and the total production ¥17,401,310. The production of course cannot keep pace with the demand, and cotton cloth constitutes one of the principal imports for Manchoukuo, the amount reaching from ¥40,000,000 to ¥74,000,000.

Digitized by Google

Flour Milling Flour milling industry is one of the three main industries of Manchoukuo. It is carried on either by the old-fashioned native mills or the modern mills run by machinery. Harbin is the centre of flour milling and has 40 mills, there being only 8 other mills in the southern part of Manchoukuo. The production in recent years amounted to M¥22,800,000. This being insufficient to meet domestic consumption, an amount equal to from M¥31,400,000 to M¥58,700,000 is being imported yearly. The amount of its import is only second to that of cotton cloth in value.

Regarding the status of other industries, mention is omitted here, but their general aspects may be inferred from the figures in the table given at the outset of this subject.

Encouragement of Manufacturing Industries In spite of the existence of such potential factors as motive power, ample fuel and labour resources, the manufacturing industries in Manchuria have lagged behind owing to the lack of industrial knowledge and shortage of capital. In recent years, however, various industries have been undergoing a gradual development. The Government is also making strenuous efforts to accelerate the development of manufacturing industries. For this purpose, rationalization of management and intelligent control are deemed necessary for their further progress. With the increased cultivation and improvement of wheat, raw cotton, wool and hemp, for which the Government is now working, the flour milling, cotton spinning, hemp manufacturing and woollen textile industries will see greater development. Chemical industries including the light mental industries, and the manufacture of soda, oil shale products, cement, pulp, alcohol and sulphate of ammonia will also be stimulated shortly.

The Government is working for the rational development of industries by instituting necessary measures in order to exercise intelligent control over various industries, instead of leaving them entirely to the free and indiscriminate exploitation of entrepreneurs. With respect to the electric light and gas enterprises, which form the basis of modern industries and which are indispensable to the maintenance of the present cultural life of the people, the Government is endeavouring to remove the unnecessary and wasteful competition and the lack of technical uniformity existing under the present system. With this object in view it is planning to make a thorough readjustment of the existing electrical enterprises, and bring them under the unified management of a special corporation to be formed in the near future. At the same time it is considering the promulgation of new regulations concerning the electrical industry, and also an Industry Act and an Industrial Union Act for the regulation of factories. To secure a cheap supply of electricity, the Government has officially fixed the frequency at 50 cycles, and has subsidized the Association of Electrical Enterprisers in an effort to give the organization assistance and guidance.

Transportation and Communications

Situation in General While the area of Manchoukuo is about 1,300,000 square kilometres, which is three times the area of Japan proper, or about 1.9 times the entire area of the Japanese Empire, or slightly larger than the area of Germany and France put together, the total mileage of the railways in the country is only 6,932 kilometres, including poorly constructed light railways. It is

Digitized by Google

less than one-third of the total railway length of Japan, which is 22,920 kilometres. The railway per one thousand square kilometres of area is about 54 kilometres in Japan, but in Manchoukuo it is only 5 kilometres, less than one-tenth of the rate in Japan, though somewhat better than China in which country the rate is but one kilometre.

As transportation routes, which serve as substituting or supplementary lines to the railways, there are motor roads, water-ways, and coastwise ship lines. Motor roads in the former Three Eastern Provinces stretched only 13,200 kilometres in 1928, which excludes roads in cities, towns and villages. Compared with 43,200 kilometres of motor roads as of 1927 in Japan, which excludes the roads in cities, towns and villages, the Manchurian roads are still few and undeveloped. Manchoukuo, having a coast line of only 855 kilometres on the Sea of Pechili, the coastwise ship lines are not worth mentioning. There are, however, good inland water-ways as Manchurian rivers run through great plains from their sources to the sea. Particularly the Sungari River is navigable by ships of more than 1,000 tons for a distance of about 700 kilometres from its confluence with the Amur to Harbin. But the great drawback to the river is that during the five months of freezing in winter, steamship navigation is impossible, although motor cars can use the frozen river as a highway during these winter months. Next comes the Liao River, but this is not navigable for large ships as the stream near its mouth is shallow.

In short, the transportation facilities of Manchuria are still undeveloped compared with conditions in other countries, and even this imperfect system is mostly developed by and dependent upon foreign capital. Out of the total length of railways, only 1,500 kilometres or 23 per cent. were constructed and operated by native capital, and the remaining larger portion used to be maintained by funds of Japan, Russia, Great Britain and other countries, though the situation has been slightly improved recently.

Railways before the Great War The first construction of railways in Manchoukuo was made by Great Britain and Russia, starting about 1890, in competition to each other. Great Britain established the North China Railway which now connects Peiping with Mukden. Later this line was extended northward to Tientsin and Peiping, and eastward to Yingkow and Mukden. It was in 1894 that the eastern extension of the line reached Suichang, about 90 kilometres from Shanhaikwan. Later in 1903, the main line was extended to Hsinmintun on the middle course of the Liao River, and a branch line to Yingkow on the lower stream of the Liao, which was the only open port of Manchuria until October, 1903.

In 1896, Russia obtained the right of constructing and operating a railway line crossing North Manchuria east and west. Then in 1898, she secured the similar right to construct a branch line from Harbin on the main line to Port Arthur and Dairen as well as to Yingkow. The construction of the main line extending from Manchoukuo to Vladivostok via Pogranichnaya was finished in 1901, and the southern line, including the Yingkow branch, was completed in 1903. The main and branch lines, comprising 2,500 kilometres, were opened to traffic on July, 1903.

By the terms of the Portsmouth Treaty, Japan succeeded to the Russian railway in Manchuria, south of Changchun, or Hsinking, totalling about 840 kilometres. Also Japan

Digitized by Google

secured the right of improving the light railway between Antung and Mukden from China, about 290 kilometres. In 1912, Japan completed construction of the Kirin-Changchun Railway, 128 kilometres.

The above is an outline of railway construction in Manchuria prior to the Great War. By that time the total length of railways in Manchuria reached 4,035 kilometres, of which railways constructed by Japanese, Japanese loan and Sino-Japanese joint capital were 1,265 kilometres, lines constructed by Russia 1,726 kilometres, and that constructed through British loan 1,014 kilometres, while the line constructed by China stretched only for 29 kilometres.

Present Conditions After the Great War, the development of railways constructed with Japanese funds and those built with Chinese capital was remarkable. The line constructed with Japanese capital is the Ssupingkai-Taonan Railway with a branch to Tungliao, 426 kilometres, opened to traffic in October, 1923. Also the Taonan-Angangki Railway was opened to traffic in July, 1926, the Chinfu or Chinchou-Chengtzutung Railway in October, 1927, the Kirin-Tunhua Railway in October, 1928, and the Tientu Light Railway in the Chientao district in August, 1922.

By the utilization of foreign capital the government of Fengtien province started construction of railways to rival the Japanese lines. The first of such lines was the railway which runs from Tahushan on the Peking-Mukden Railway to Tungliao, a distance of 252 kilometres. Other lines were the Fenghai and Kihai Railways, which connect Mukden and Kirin via Hailung and Chaoyangchun. In North Manchuria, there are the Hulan-Hailun Railways, opened in December, 1928; a railway which now runs from Tsitsihar to Taian, but is expected to be extended to Koshanchen in the future; and also several coal mine railways.

Railway Policy of Manchoukuo Railways come under the supervision of the Minister of Communications, but the actual business relating to railways, the matters attached to them, and supervision over them are in the hands of the head of the railway bureau in the department. In view of the fact that railways in Manchoukuo are still in an undevelopd stage, with many small independent railways, differing widely in their method of management, etc., the Manchoukuo Government deemed it advisable to unify the management. Considering that it would be best to entrust the management to an experienced body, the Government placed the management of the entire national railways in charge of the South Manchuria Railway on March 1, 1933. Thereupon, the South Manchuria Railway Co. established the headquarters of railways at Mukden, and the company not only looked after the railways and other business attached to them, but took charge of the construction of railways, harbours, etc. Since the establishment of Manchoukuo a network of railways has been rapidly laid out, and by the end of 1933, the total mileage was 6,932 km., or 725 km. more than at the time of the Manchurian incident. The conditions of the railways in Manchoukuo are shown in the following table:

The new railway lines which were constructed after the Manchurian Incident by the State and those new lines which have been proposed and are now under construction follow :

NEW RAILWAY LINES CONSTRUCTED AFTER THE INCIDENT

Lines	Terminals	Distance in kilometre
Chaoyang-Koupeiyingtzu	Chaoyang and Koupeiyingtzu	191.9
Tunhua-Tumen	Tunhua and Tumen	161.6
Hailun-Koshan	Hailun and Koshan	46.4
Taian-Koshan	Taian and Koshan	271.7
Lafa-Harbin	Lafa and Harbin	88.8
Lafa-Noho	Lafa and Noho	59.9
Chaoyang-Tumenho	Chaoyang and Tumenho	39.7
Total		810.0

NEW LINES PROPOSED AND UNDER CONSTRUCTION

Lines	Terminals	Distance in kilometre
Yuki-Rashin	Yiki and Rashin	15.3
Tapan-Lingyuan	Tapan and Lingyuan	156.3
Lingyuan-Chengte	Lingyuan and Chengte	188.6
Tumen-Ningpei	Tumen and Ningpei	252.2
Peian-Chenching	Peian and Chenching	186.3
Hsinking-Talai	Hsinging and Talai	212.0
Ningpei-Chiamussu	Ningpei and Chiamussu	310.0
Yehpaishou-Chifeng	Yehpaishou and Chifeng	166.0
Chenchin-Heiho	Chenchin and Heiho	135.0
Taonan-Tailai	Taonan and Tailai	128.0
Hwaiyuanchen-Solin	Hwaiyuanchen and Solin	95.0

South Manchuria Railway Co. This railway was acquired by Japan as a result of the Portsmouth Treaty of September, 1905, and the Sino-Japanese Treaty of December, 1905. The rights Japan secured in respect to the railway line between Dairen and Hsinking, and branch lines, were those originally held by Russia. The company is capitalized at ¥800,000,000 following the issuance of 3,600,000 new shares of ¥100 each on August 10, 1933. Until then the capital of the company was ¥440,000,000, one-half of which was held by the Japanese government, the other half being distributed among private shareholders.

The president and vice-president of the company are appointed by the Japanese Government with Imperial sanction, while the directors are also appointed by the Government, though without Imperial sanction. The auditors are elected from among the shareholders.

(1) Volume of Business. Since its formal organization in 1906 the railway business of this company has grown with the years as is shown in the following table :

Year	Passenger Revenue	Freight Revenue	Other Revenues	Total
1907	¥ 3,594,289	¥ 6,160,274	¥ 14,875	¥ 9,768,887
1912	5,008,633	13,913,341	985,482	19,907,456
1916	6,040,453	19,882,476	1,892,420	27,815,349
1921	12,194,288	59,615,835	6,394,010	78,204,132
1926	15,216,353	89,513,059	3,194,155	107,923,567

Digitized by Google

Year	Passenger Revenue	Freight Revenue	Other Revenues	Total
1927	16,102,953	94,040,819	3,100,408	113,244,180
1928	17,619,293	97,738,147	3,281,649	118,639,090
1929	17,451,585	101,089,474	3,562,684	122,103,743
1930	11,461,175	77,936,688	5,982,867	95,380,730
1931	9,185,663	70,897,756	4,539,937	84,573,356
1932	14,812,045	85,022,314	4,012,153	103,846,512
1933	18,757,000	97,263,000	—	122,677,000

Among the goods transported by this railway, beans, bean cake, cereals and coals are the most important items.

(2) Accessory Business. In addition to its transportation business, the company is engaged in activities in many other fields including manufacturing, warehousing, shipping, mining, real estate and building, and various public works.

(a) As regards manufacturing, the company makes and repairs its own locomotives and other rolling stock at its Dairen shop, which occupies a site of 340,000 tsubo in area.

(b) The company operates warehousing business at 31 different places at the wharf of Dairen and along its railway lines.

(c) As for marine transportation, the company started a steamship service between Dairen and Shanghai in 1907. The opening of the Tsingtao line and the Hongkong line followed later, the latter being intended to facilitate the shipping of the company's coal, mined at Fushun, to South China.

All these three lines were later transferred to the Dairen Steamship Company, which is capitalized at ¥25,000,000 by the company.

(d) Since the opening of its business, the company has devoted considerable attention to the improvement of the harbour of Dairen, and the greater half of the entire harbour programme has already been finished, its present facilities being capable of handling 7,000,000 tons of freight annually with a berthing capacity of 190,000 tons of shipping at the same time.

(e) In mining, the company operates coal mines at Fushun and Yentai, and in addition to this, it is also engaged in shale-oil mining and steel foundry work.

(f) In the railway zone, the company is engaged in the real estate, building business and municipal administration, attending to the needs of sanitation, education and policing, while at the same time promoting agriculture, industry, commerce and mining in this area.

(g) The landed estate owned by this company extends over a total area of 371,430,000 square metres, of which approximately 59,000,000 square metres is leased to individuals. The company also owns some 14,200 buildings, of which 859 are rented to individuals.

(h) Another notable achievement of the company is its city-planning in various places. Up to the present it has built 25 cities at Liaoyang, Mukden, Hsinking, Yingkow, Antung, and other places. In these places the company has constructed roads, bridges, sewerage, schools, parks, markets and other modern municipal facilities.

(i) In education, the company now operates 26 kindergartens, 36 primary schools, 5 middle schools, 4 girls' high schools, 2 colleges, one university, 10 public schools for Chinese students, 34 business supplementary schools, 13 girls' housekeeping schools, 2 commercial schools, one mining school, and six other schools. It has also opened two public libraries, one each at Dairen and

Digitized by Google

Mukden, and 21 other reading rooms. (j) Among other enterprises of the company are 16 hospitals and 5 branches, and for research and experimental work it carries on a hygienic station, an agricultural station, a farm, a tobacco farm, a geological research station, a central experimental station, and other institutions.

In 1933 the total revenue and expenditure of the company amounted to ¥248,001,717 and ¥205,081,163 respectively.

State Railway Of the total railway mileage of 6,932 kilometres, the lines owned by the Manchoukuo government covers about 5,500 kilometres. Of these railways, except those which have been completed after the Incident, most of them were constructed to rival the South Manchuria Railway Co. by the militarists of the Three Eastern Provinces. The North Manchuria Railway which was transferred to Manchoukuo by the U.S.S.R. in March, 1935, also used to be a strong competitive line of the South Manchuria Railway Co. and the Soviet Government pursued a policy which was detrimental to the interests of the South Manchuria Railway Co. As already stated these railways are now managed by the South Manchuria Railway Co. as the State organs. They are serving and will serve as such for the economic and cultural development of the country.

Water Transportation Principal ports of Manchoukuo are Dairen, Port Arthur, Yingkow, Antung and Hulutao, the harbour of the last named being still under construction.

(1) Dairen. Dairen is at the extreme end of the Kwantung Penninsula, and has a population of 400,000, being the second largest city in Manchuria. It was leased in 1898 by Russia and was made an open port in July, 1907. Soon the harbour was much improved so as to berth simultaneously 27 steamships, ranging from 1,000 tons to 25,000 tons. Furthermore, in 1930, a coal wharf was constructed at Kauchingtzu on the other side of the bay opposite Dairen. The harbour freezes in winter from December to February, but only slightly and the entrance and departure of ships are made possible by the use of ice-breakers. The management of the wharf is conducted by the South Manchuria Railway Company under the supervision of the Kwantung government.

The trade via Dairen now totals M¥703,000,000 a year, or 75 per cent. of the entire trade of Manchuria. In passenger traffic, Dairen occupies a very important position in the Europe-Asia international routes. From this port the South Manchuria Railway Company operates international trains to connect with the Korean Railway to Japan, and with the North Manchuria Railway and the Trans-Siberia Railway to Europe.

The recent traffic at the port of Dairen are shown in the following tables :

PASSENGER TRAFFIC

AT DAIREN

Passengers Embarking	1931	1932	1933
Manchurians	183,956	289,393	252,465

(2) Other Ports. Yingkow harbour is situated at a place 21 kilometres above the mouth of the Liao River. Its depth is from 7 to 20 metres, but the greatest defect of Yingkow harbour is its shallowness, as the water is only 2 to 1.5 metres deep at low tide. Exports, which consist of soy beans, bean cake, coal, pig iron, amount to 1,350,000 tons while about 160,000 tons of commodities are imported through this port annually.

The harbour of Antung is located 31 kilometres above Hsintao at the mouth of the Yalu River. At Antung the river is from 1,000 to 1,500 metres wide, and the water under the Antung Railway Bridge is 3.7 metres deep at average low tide. But the water in front of Wutaokou in the lower stream shoals at low tide is only 0.9 to 1.8 metres deep. This shallowness in the lower stream has greatly hindered the development of Antung. Also, the river freezes from November to February. Though Antung has such defects, it possesses the advantage of being able to surpass other Manchurian harbours as a shipping port for lumber.

The construction of the Hulutao harbour was commenced on July, 1930, and according to the contract entered into between the government of the former Eastern Provinces and Netherlands Harbour Construction

Digitized by Google

Company, it was to be completed within 5 years and 6 months after the commencement of work. The construction of wharfs and quays, and the reclamation of land for city lots had already made notable progress. The Manchoukuo Government, however, decided to suspend its construction for the present.

(3) Rivers The rivers of Manchoukuo are serving as important transportation routes supplementing the insufficient railway lines, as they run for long distances from their sources to the sea and mostly traverse large plains. The largest river is the Sungari, and the second is the Liao. The Sungari and the Liao Rivers with their numbers branch streams travers south and north of Manchuria and give facilities for boat and steamship navigation.

The Sungari River is a branch of the Amur or Heilungkiang River and for a distance of about 700 kilometres from its confluence with the Amur River upstream to Harbin, it is wide and deep with more than 7 feet of water, and is possible for navigation by steamships of more than 1,000 tons. The river traffic is very busy in this section. Whence small steamships and junks are able to navigate a further distance of 500 kilometres on the main stream to Kirin, and also on its north-western affluent, the Nonni River, up to Tsitsihar. But the Sungari and its branches have the disadvantages of being frozen in winter for about five months.

The Liao River is navigable by small boats, the largest of which has a loading capacity of about 20 tons, for about 880 kilometres on the main stream. It was a very important transportation route before the opening of the South Manchuria Railway, ships navigating on the river once numbering 10,000. The Yalu River is navigable from the mouth to the lower stream, about 180 kilometres above Antung, and is available for navigation by junks more than 8 tons. As for the Tumen River, it runs through mountainous districts, and is very narrow. It is serviceable for floating down rafts in the rainy season.

Roads On March 3, 1933, the Bureau of State Highways was established to undertake the building of national highways, and riparian works. In Hsinking, Mukden and Tsitsihar local state highway construction offices were opened and each was entrusted with the construction of state roads within its territory. The Bureau drew up a road construction programme for the completion of 60,000 km. of new highways within ten years. The first plan for 1932 and 1933 was to build 62 roads with a total length of 7,550 km. at an estimated expenditure of M¥15,000,000. This schedule, however, was hindered by the outbreak of Jehol campaign. With the completion of the pacification of Jehol province road building was again commenced in the other parts of the new State.

More than 30 roads totalling over 2,800 km. have been constructed up to the present. Most of the newly-built highways are unpaved, but their surface has been hardened by rollers.

The motor bus business has expanded enormously with the construction of new highways. At the end of 1933 there were a total of 39 bus lines comprising 5,461 km., including the State and private lines, as the following figures show:

Digitized by Google

	State	Private	Total
No. of bus lines	12	27	39
Total length	2,939km.	2,522km.	5,461km.
No. of motor cars	253	167	420
Capital invested	M¥2,103,622	M¥1,430,000	M¥3,533,632

All bus services along railway lines or running parallel to such lines, and others over routes which will later become railways, as well as those which play important rôle in the opening up of new territories and in the maintenance of peace and order, and which are not paying propositions, are managed by the State through the General Board of State Railways.

Air Transport Air transportation in Manchuria has just made its initial development. A regular line is the Korea-Manchuria route operated by the Japan Air Transportation Company. There were proposed various plans for the improvement of the air transportation and many were in course of projection.

For air service the Manchuria Air Transport Company was established after founding of the new state, and a regular air service for transport of passengers, freights and mails was opened. In February of 1934 there were no less than 13 regular routes operated by the company. Aviation in the country is favoured by the vastness of the territory and the suitable climatic and topographical conditions. The routes now extend 6,000 km. and two round trips are being made between Hsinking, Harbin and Tsitsihar. Principal regular air routes follow:

REGULAR AIR ROUTES IN MANCHOUKUO

Routes	No. of Return trips a week
Shingishu-Mukden	6

Harbin-Heiho	3
Tsitsihar-Heiho	1

Communications (1) Postal and Telegraph Service. In the postal service, there are 150 post offices, 333 postal agencies and 1,284 town and rural box offices and sales agencies in the Mukden district, and 141 post offices, 293 postal agencies and 463 town and rural box offices and sales agencies in the Kirin-Heilungkiang district.

With the pacification of Jehol in 1933, the Government succeeded in bringing the postal administration throughout the country under its complete control. Since then postal charges have been reduced for both domestic and foreign mails. In May, 1933, a postal savings, telegraphic transfer, postal note and savings transfer, and account services were opened for the benefit of masses. In addition the new administration has inaugurated an international postal air service. Mail matters collected and delivered by Manchoukuo in recent years follow:

MAIL MATTERS COLLECTED AND DELIVERED

Year	Kind of Mails	Collected	Delivered	Total
1929	Air mail	4,418	3,888	8,306

There are the following telegraph lines between Manchuria and Japan proper :

Dairen-Sasebo submarine cable, laid during the Russo-Japanese War.
Dairen-Osaka direct line, via Korea, laid in May, 1919.
Mukden-Osaka direct line, via Korea, laid in June, 1919,
Dairen-Nagasaki submarine cable, laid in April, 1921, by the South Manchuria Railway Company and leased by the government.
Mukden - Shimonoseki direct line, via Korea, laid in December, 1926.

Although the telegraph and telephone enterprises were formerly under the control and management of the Department of Communications, they were amalgamated into the Manchuria Telegraph and Telephone Company, a Manchoukuo-Japanese joint enterprise with a capital of M¥50,000,000 in August, 1933. This step was taken to unify all electric communication enterprises in the country and also to facilitate and expand electric communications between Japan and Manchoukuo, as under the old system great inconvenience was experienced in exchanging communications between the two countries. Since its establishment, telegraphic communications between principal cities in the country have been improved and with the completion of wireless service at Hsinking on Aug. 1, 1934, it succeeded not only in effecting wireless telephone service with Japan, but also in opening the service with Europe and America. In April, 1933, the broadcasting station was established in Hsinking. At the end of 1933 the telegraph lines in the country extended 13,000 km. and telephone lines 9,000 km., while the number of subscribers for the telephone was 33,000. Following tables show the status of telegraph and telephone services in Manchoukuo during 1929-1932 inclusive :

TELEGRAMS DESPATCHED AND RECEIVED

Justice and Police

General The present judicial system of Manchoukuo comes largely from the old Chinese system, which existed before the founding of Manchoukuo. Therefore it would be well to examine the judicial system of that country.

Before the unification of the country by the National Government, the number and grades of new courts established in China proper, the Three Eastern Provinces and other districts were as follows:

1. Supreme court, 1; supreme court prosecutorate, 1 at Nanking.
2. High court and high court prosecutorate, 23.
3. Branch high court and branch high court prosecutorate, 26.
4. District court and district court prosecutorate, 66.
5. Branch district court and branch district court prosecutorate, 25.

In the Three Eastern Provinces and particularly in Fengtien province, attention had been directed to the improvement of the court system since the establishment of the Republican Government in 1912. Before the unification by the National Government, Manchuria had seventeen new courts consisting of one high court, one branch high court, eleven district courts and four branch district courts.

As the courts of the transitory period, there was also a district judicial office. This court was formed according to the district judicial office regulation, and was established at the office of the district magistrate. In Fengtien province, there were thirteen such district judicial offices. In districts where there was not yet opened either a new court or district judicial office, the district magistrate conducted all judicial affairs. The office of the district magistrate was the only judicial court in China before the inauguration of the new courts. Actually the majority of trials were held at such old-fashioned courts. In Fengtien province, the number of new courts and district judicial offices being comparatively numerous, district magistrates undertaking additional judicial administration were few. Before the establishment of the new Government of Manchoukuo, out of a total number of fifty-eight districts, only twenty-seven districts, or about one-half, had the old-fashioned judicial system.

Judicial System Manchoukuo having been only recently established, the general improvement of the judicial system has not yet been commenced, but with the establishment of the new Government, the outline of judicial improvement has already been decided. That is to say, according to the principle of the independence of the four divisions of government, the judicial power is invested directly with the Emperor, and its independence is assured by making it independent of the cabinet. The Supreme Court and the Supreme Court Prosecutorate have been established at Hsinking. The number of other courts and prosecutorates in December, 1932, follows:

Province	High Court			District Courts			
	High Courts	Branch High Courts	District Courts	District Courts attached to High Courts	Branch District Courts	District Judicial Offices	District Magistrates
Fengtien	1	1	13	1	9	9	26
Kirin	1	2	2	2	2	15	24

Police System With the founding of Manchoukuo, the police administration was put under supervision of the Minister of Civil Affairs, and a new police system was founded, which would suit the particular conditions of each province. According to the investigation made by the police bureau in the Department of Civil Affairs in November of 1932, the total number of police was 101,000.

Education and Religion

General Under the régime of the Chang family, the greater part of the revenue was spent for the army, and therefore the development of education in Manchuria could not be hoped for. Moreover, the people, from whom everything was squeezed, had very little left to send their children to schools, so that the percentage of children attending schools was extremely low in Manchuria. The investigation made in 1925 showed that 92 per cent. of the population in Manchuria was utterly illiterate.

In order to improve the situation, the Education Minister decided upon on July 29, 1932, the basic principles of education. The ministry advocates the principles of Confucianism ; and towards foreigners it teaches friendliness and the keeping up of mutual well being.

Though the expenses which the Manchoukuo Government defrayed for education in the first year after its founding was very small, being only 0.19 per cent. of the total expenditure, it steadily increased thereafter. In the budget for 1934-35, the expenditure estimated for education was M¥6,114,268, as against M¥931,102 for the previous year. The growth of the expenditure in this instance is close to 600 per cent. which shows how strenuously the Government is aiming at the advancement of education of the people.

For some time after the Manchurian incident occurred many schools were closed, most of which, however, have been reopened. On May 1, 1933, the number of schools, both of those already reopened and those still closed, follow :

Province	Total			Primary Schools	
	Reopened	Still Closed	Total	Reopened	Still Closed
Fengtien	6,885	3,465	10,350	6,683	3,375

Institutions by Western Peoples Educational institutions maintained by Western peoples are under the management of religious workers.

No tuition fee is collected at any of these missionary schools, and invariably these schools bear a portion of students' dormitory or boarding expenses. Mission schools are welcomed by the Chinese people because they encourage study, and give protection and aid to children of the poor who have no opportunity for study though possessing both ambition and ability to learn.

These educational establishments are mostly carried on by British, French, German, and Danish nationals. The schools maintained by foreign missions in Manchuria were as follows, in 1929.

	Primary School	Secondary School	Others
Fengtien Province	111	10	11
Kirin Province	31	1	2
Heilungkiang Province	7	—	—
Total	149	11	13
Number of Students	2,785	1,188	455

Some of those above mentioned were established for the education of the children of their own nationals.

As regards schools for Russians there are 14 secondary schools, 8 primary schools, and 3 kindergartens of the Soviet Union in the Tungsheng Special District.

Institutions Maintained by Japanese The educational institutions maintained by Japanese in Manchuria may be divided into those for the education of the Japanese (there are separate institutions for Koreans) and those for the education of the Chinese. These educational institutions are controlled by the Kwantung government in the Kwantung Leased Territory, and by the South Manchuria Railway Company in the railway zone, and by Japanese consulates in the consular districts.

The Japanese educational system in Manchuria has developed tremendously in the last twenty years, to an extent undreamed of at the time of the establishment of the South Manchuria Railway Company in April, 1907. At that time there were only six primary schools in Manchuria maintained by the Japanese—two primary schools for the Japanese and two primary schools for the Chinese maintained by the Kwantung government in the Leased Territory, and outside the Leased Territory, one primary school established by the Liaoyang Y. M. C. A., and one primary school established by Buddhist missionaries. The South Manchuria Railway Company has also opened primary schools at many points in the railway zone, and, after plac-

Religion The principal religions in Manchoukuo are Confucianism, Buddhism, Taoism, Lamaism, and Mohammedanism. Christianity was introduced in 1858. In April, 1934, the Holy See formed a separate mission field in Manchoukuo, independent from that of China, and appointed the Rt. Rev. Bishop A. Gaspais as Acting Apostolic Delegate for whole Manchoukuo. The number of preachers and believers for each and the number of temples and shrines follow:

Labour and Labour Movement

General According to an investigation made in 1930 on about one half of the population in Manchuria, those engaged in agriculture reached 32.5 per cent., those in industrial works 14.6 per cent., those in commercial work 16.1 per cent., those in transportation work 8.7 per cent., while those in public service and professionals reached 6.5 per cent. Although it is impossible to accept this figure as very accurate, it serves to prove that modern industries are developed more in districts where Japanese influence is comparatively strong.

An interesting feature of the labourers in Manchuria is that they come mostly from Shantung and Hopei provinces, and a very few of them come from near-by places. According to an investigation made on a mill in Dairen, the number of labourers coming from various provinces in China and Manchuria were found to be as follows :

Province from which labourers came	Number	Percentage
Shantung	8,374	91.2
Hopei	523	5.7
Chiangsu	119	1.3
Province from which labourers came	Number	Percentage
Kwantung Leased Territory	74	0.8
Fengtien	72	0.8
Kirin	9	0.1
Other places	10	0.1
Total	9,182	100.0

According to the Manchurian Industrial Statistics compiled in 1931, the number of labourers is greatest in the chemical industry. By chemical industry is meant the soy bean manufacturing industry which employs from 10 to 30 coolies, and does not require much skill. According to an investigation made at the end of June, 1932, the number of labourers employed in mills including mining in the Kwantung Leased Territory and the South Manchuria Railway Zone were 82,000, the number employed in civil engineering, building, and transportation works 45,000, and unskilled labour 65,000.

Wages Labour wages in this country continued to decline up to the outbreak of the Manchurian Incident. After the incident they started to rise. By locality, wages are higher in Hsinking and its neighbouring districts than in sea ports in the south.

Coolies and Immigration The most characteristic aspect of Chinese labourers working in Manchuria are the coolies. They are migratory labourers from Shantung, Hopei or Chihli and other parts of China proper, coming generally to Dairen, Yingkow, or Antung by steamships as deck-passengers, but sometimes also on foot or by the Peking-Mukden Railway. Because of natural calamities, civil wars and political unrest in China proper, they came to entertain the idea that they would be able to lead an easier and more comfortable life by settling in Manchuria. They begin to leave their homes in February, after finishing the New Year celebration (according to the old calendar), and their movement reaches its greatest volume in March; by April or May they generally reach Manchuria and start work. About November most of them leave, so that by January they are all back again in their homes to celebrate the New Year. In this way, year after year, they repeat the journey to Manchuria. The number of coolies entering Manchuria is larger in the first half of the year than in the second half, about 60 percent of the total migration being completed before June.

At first they are employed in railway construction, lumbering, land-developing, and agricultural work, and occasionally in mining, industrial and transportation work of the South Manchuria Railway Company and other organizations. In the past ten years, the number of those coming in large groups has shown a steady increase. Although the exact number of these people coming from China proper to Manchuria is impossible to ascertain, the following estimate of those coming by steamships from Tsingtao, Lungkow, and Tientsin to Dairen, Yingkow and Anyung, and those coming by the land route to the Mukden district, serves as approximate figures:

Year	Entering Manchuria	Leaving Manchuria	Balance	Percentage of settlers of all immigrants
1923	392,286	286,765	105,521	26.9
1924	429,254	232,720	196,534	45.8
1925	490,142	214,547	275,595	56.2
1926	592,343	299,392	292,951	49.5
1927	1,050,838	341,599	709,229	67.5
1928	938,472	394,247	544,225	58.0
1929	1,046,291	621,897	424,394	40.5
1930	748,214	512,793	235,420	31.6
1931	480,000	—	—	—

Digitized by Google

As shown in the above table, the number of Chinese entering Manchuria reached the largest figure in the 1927-1929 period, while the percentage of those settling there showed the highest mark, 67.5 per cent., in 1927, since when it showed a gradual decline. But in the eight years from 1923 to 1930, nearly 5,700,000 Chinese came to Manchuria and of this total, 2,800,000, or nearly one-half, have settled there,—the greatest recorded movement of the human race in such a short period.

Trade Unions and Strikes In Manchuria there is so far hardly any firmly organized trade union that deserves special mention, because the workers have little knowledge of how to organize themselves.

Labour organizations, such as the Kungso or Hui, etc. have been formed from old times by labourers engaged in the same occupation or by those coming from the same native district, for the protection of their mutual interests. The number of such organizations was never large, but with the development and success of the National revolutionary movement, Kungjenhui or modern trade unions began to spread. The leaders were radicals—among whom there were many students and some who had even received communist training.

Organizations recognized as trade unions and their members as at the end of 1931 were as follows:

Dairen: Name	Members
Dairen Construction Workers Union	550 Japanese and Chinese
Dairen Tramway Chinese Young Men's Union	400 Chinese
Electric Tramway Workers Union	110 Japanese
Kwantung Mat-makers Union	800 Japanese and Chinese
Kwantung Fishery Seamen's Association	370 Japanese
Dairen Marine Workers Union	120 Koreans
Japanese Seamen's Union Branch	Japanese (number variable)

Medicine and Sanitation

Sanitary Conditions The climate of Manchuria is not at all unhealthy. But since it is extensive, borders on Mongolia and Siberia and is inhabited by different races, many of whom lead the insanitary life of extremely primitive conditions, and especially since coolies and refugees are constantly migrating in large groups, the risk of the spread of dreadful infectious diseases is rather common. In the past twenty years, Manchuria has been often afflicted by such plagues; for instance, the pneumonic plague in 1910-1911, cholera in 1919, pneumonic plague again in 1920-1921, and pneumonic plague once more in 1927. The prevention of infectious diseases, therefore, is extremely important in Manchuria, and international co-operation is required for this purpose. The spread of pneumonic plague in 1910 is said to have been due to the lack of such international co-operation at the proper moment.

Medical Institutions There are hardly any medical institutions worth mentioning. Most of the medical institutions are in the large cities of the Kwantung Leased Territory and the South Manchuria Railway Zone. In the villages or small towns which are outside of these districts, there are practitioners in Chinese medicine and other ordinary physicians, a very few of whom, however, are reliable. At present no accurate statistics for the medical institutions are available. The number of government and public hospitals in Manchoukuo is as follows:

	Government	Public	Total
Fengtien	14	15	29
Kirin	3	1	4
Heilungkiang	2	3	5
Tungsheng Special District	?	?	15
Total	19	29	63

Besides the above there are 11 hospitals maintained by the British, 2 hospitals maintained by the Danes, and 1 each maintained by the French and Canadians.

The number of physicians, dentists, mid-wives, pharmacists and drug stores follows:

Physicians	Fengtien Province	Kirin Province	Heilungkiang Province	Tungsheng Special District	Total
Practitioners in the Chinese medicine	3,284	495	398	99	4,276
Ordinary physicians	658	133	121	287	1,199

New-styled	600	4	39	7	650
Pharmacists	441	?	?	?	441
Drug stores					
Chinese drug	995	?	?	?	996
Western medicine	229	?	?	?	229

Medical Education As organs for educating medical students there are Fengtien Medical College (private), Harbin Medical College (private), Medical School attached to Kirin Government Hospital, Manchuria Medical College and Russian First and Second Colleges (private). Most of these are run by the Japanese and other foreigners, and except the Manchuria Medical College, they are very poorly equipped, and the education of medical students is in a very unsatisfactory state. In view of this, the Manchuria Medical College opened its technical course in 1933 and now admits Manchurian students.

Sanitation The local offices of the South Manchuria Railway Company take charge of public sanitation as local administrative bodies. Hygiene experts are stationed at various important places who look after hygiene and epidemic prevention and act also as police medical officers in their respective districts. The hygiene of so-called private settlements outside the railway zone is under the control of the police of the Japanese consulates. Thus the Japanese system of hygiene administration in Manchuria is complicated, and in the railway zone, a hygiene committee is maintained by the police and the local expert of the railway company, in order to secure co-operation in the control of hygiene and epidemic prevention. Quarantine and the hygiene of the ports of Dairen and Port Arthur are under the direction of the Marine Office of the Kwantung government and its branch.

Hygienic investigations and inspections are conducted by the following institutions: The Central Laboratory, the Hygiene Institute and the Animal Disease Research Institute of the South Manchuria Railway Company; the government hospitals at Dairen and Port Arthur; physicians, veterinary surgeons and pharmaceutists stationed by the Kwantung government at civil administration offices, police stations and sub-stations.

The Hygienic Institute was established in 1925 by the railway company at an outlay of ¥400,000 in view of the lack of facilities for pathogenic investigations, and also for the supply of preventive and curative medicines.

Vaccines, serums, and disinfectants produced at the Institute are distributed free or at cost not only in Manchuria but also in Tientsin and Shantung districts. The production and distribution of vaccines and serums in recent years were as follows:

	Vaccines and Serums Manufactured in c.c.	Products Sold or Distributed in c.c.
1928	21,856,857	21,128,423
1929	25,574,962	25,518,384
1930	30,801,140	30,728,469

The Animal Disease Research Institute of the South Manchuria Railway Co. was established in 1925 at Mukden at a cost of ¥250,000. The

Digitized by Google

Institute is divided into the Research and Enterprise Divisions. The Enterprise Division manufactures and distributes serums, vaccines and medicines for various animal diseases, conducts classes and lectures on animal diseases, gives itinerant medical treatment by sending free treatment and research corps, and also operates the examination station in the Institute.

Principal Cities

Hsinking Situated at the northern terminus of the South Manchuria Railway line, Hsinking (formerly known as Changchun) is the capital of Manchoukuo and contains the Imperial Palace and all other important government buildings.

This city is also an important commercial centre as it forms the junction of the South Manchuria Railway, the North Manchuria Railway and the Kirin-Changchun Railway. Its area, inclusive of the S.M.R. Zone, the Open Mart, the Chinese town and Kuanchengtzu, was prior to the establishment of the new state 21 sq. km. Today, owing to the rapid expansion of the city, its area, including the new first-stage construction zone, is 41 sq. km. The population is rapidly increasing, and is expected to exceed 300,000 by the time of the completion of the first stage of construction works in 1936, and surpass the half-million mark when the second and third stage projects are finished.

It is divided into three sections known as the new city, the open town and the walled city, and plans are now being promoted which will ultimately make it a fine metropolis of some 3,000,000 population.

At the end of 1933, the population of Hsinking Special Municipality was 140,945, though prior to the establishment of the new state, the population had remained at about 130,000.

The Japanese population in Hsinking is said to have increased from 10,000 to approximately 15,000 during the past year, and the Japanese institutions in this city include the chamber of commerce and industry, the stock exchange, banks, industrial organizations, the district and transportation offices of the South Manchuria Railway Company, and several schools of various grades, in addition to the offices of the ambassador extraordinary and plenipotentiary, the consulate-general, and the headquarters of the commander of the Kwantung army.

Capital Construction Plan According to the city planning programme of the Capital Construction Bureau, which has been created in the General Affairs Board of the Manchoukuo Government, the great metropolis to be built around the present city of Hsinking is to cover an area of 200 square kilometres, an oblong polygon in shape, with its centre at Kaotaitze, which is situated a little south of Hsinking Railway Station.

During the first period of the capital construction programme work will be undertaken in an area of about 100 square kilometres out of the total of 200 square kilometres. In this area are located the S. M. R. Zone, the North Manchuria Railway (C. E. R.) Zone the open town and the native city, covering a total area of 21 square kilometres, which will not be directly affected by the city planning programme so that the grounds on which the actual construction work is to be carried on cover an area of 79 square kilometres.

On completion the new metropolis is to be divided into residential, commercial, industrial, special and miscellaneous districts, each designated as such, and it is hoped that the whole city will assume the grand

Digitized by Google

appearance of a metropolis as modern in equipment as any other in the world, with seven trunk roads radiating in all directions from its centre. They are as follows :

Hsinking-Nungan-Fuyu	160km
Hsinking-Huaite-Kungchuling	100 ,,
Hsinking-Mukden via Kungchuling	270 ,,
Hsinking-Itung	72 ,,
Hsinking-Shuangyang	50 ,,
Hsinking-Kirin via Tapinling	114 ,,
Hsinking-Harbin via Yaomen	235 ,,

The streets in the new construction area are of three kinds, trunk (26 to 60 metres wide), branch (10 to 18 metres wide), and auxiliary (less than 10 metres wide). Both the trunk and branch streets have a section for motor traffic at the centre, with roads for slow vehicles on either side of it, and sidewalks for pedestrians on the outside. Four rows of trees will improve the appearance of the streets. The election of poles for overhead telephone, telegraph and electric wires will be forbidden, all wires being underground. When they are completed they will occupy 21 per cent. of the new construction area.

Anticipating that the population of this new area will eventually reach 500,000, the Capital Construction Bureau is building a huge reservoir in the basins of the Hsiao and Tai Rivers, tributaries of the Itung River, for supplying water to the capital. The projected reservoir, which will be one of the largest in the Far East, will be filled with rain water and water obtained by damming the two tributaries. It will hold 27,700,000 cubic metres, and will be capable of supplying over 40,000 tons of water daily, which will be more than enough to meet the needs of a population of 500,000. The project is scheduled to be completed by the end of October, 1935.

An up-to-date sewer system is also being built as part of the capital construction programme. Already 48,301 metres of sewer pipes have been laid in the new area.

Spacious parks will be a feature of the new section of the city. These will occupy seven per cent. of the total area of the new town. In the vicinity of the parks are projected a national museum, a huge public library, public auditoriums, botanical gardens, and a zoo. Athletic fields, a horse race course and golf links have been already completed, or are nearing completion. When the present projects are completed, Hsinking will no doubt rank as one of the leading modern cities in the Far East.

Mukden Mukden, formerly the headquarters of the old militarist government of the Chang family, still retains its prosperity as a commercial and industrial centre of Manchoukuo situated as it is in the heart of a vast plain watered by the Liao River.

The main line and the Antung-Mukden line of the South Manchuria Railway, the Mukden-Shanhaikwan Railway, and the Mukden-Hailung Railway converge at Mukden thus making this city an important point of communication between Europe and Asia.

As an industrial centre, Mukden produces matches, bean-oil, rice, pottery, textiles and tobacco. This city also is a centre of education in Manchoukuo, among its important schools being the Manchuria Medical College, in addition to several primary and secondary schools for boys and girls.

The population of the open town and the railway zone of Mukden is estimated at a little over 200,000, of which some 25,000 are Japanese nationals.

Dairen Dairen is the most impor-

Digitized by Google

tant port of trade for Manchoukuo. Located in the Leased Territory of Kwantung the city is under Japanese administration. Starting from this city, the main line of the South Manchuria Railway runs north as far as Hsinking, branching off at Mukden to Antung.

The city is built on the shore of the Bay of Dairen, extending 7.8 kilometres from east to west and 3 kilometres from north to south. Divided into the residential, mixed, commercial and industrial districts, the city is well planned, with a sewerage system, parks and other modern public utilities completed by Japanese.

In 1915 the city was organized as an autonomous municipality and efforts have since been continued to perfect its sanitary and educational institutions and fire-preventing facilities.

From the central square covering an area of more than 10,000 tsubo, 10 boulevards radiate in all directions, the streets of this city being of seven different widths with a maximum of 25 ken or about 50 yards.

Among the parks of the city, Electric Park is the most famous. Hoshigaura Park, which is in Hoshigaura, a suburb of Dairen, is also well known for its golf links and its sea-bathing beach.

Being the largest commercial centre of South Manchuria, the city has a population of approximately 365,000, of which about 95,000 are Japanese coming from Japan proper. Among the important offices in the city are the headquarters of the South Manchuria Railway Company, the city hall, the civil administration office, the bureau of communications, the chamber of commerce and industry, the branch offices of the Yokohama Specie Bank, the Chungkuo Bank, the Chosen Bank, the Oriental Colonization Company, the Central Bank of Manchou, the Chenglung Bank, the Mitsui Company, the Mitsubishi Company, the Okuragumi, Mitsukoshi and other business concerns.

Various local institutions include the Manchuria Dockyard Company, the Dairen Steamship Company, the South Manchuria Electric Company and the Dairen Hospital. Among the schools in this city are 12 kindergartens, 14 primary schools, 2 middle schools, 2 girls' high schools, a commercial school, a girls' commercial school, a commercial and industrial school, a foreign language school and a technical college.

Ryojun (Port Arthur) Ryojun is the seat of the government of the Kwantung Leased Territory. Situated at the southern tip of Liaotung peninsula, the city is surrounded by hills on all sides except on its water front, which forms a port opening to the Gulf of Pechihli.

The city is made up of two sections, the old town and the new town. In the old town are located the city hall, the dockyard, the defence headquarters, the higher law court, the civil administration office and the headquarters of the Port Arthur fortress.

The new city is built on the shore of the west port and forms the government and school district with the government of the Kwantung Leased Territory, the Ryojun Engineering College, and other schools located in it.

The boulevards of the city are of two different widths, 84 feet and 63 feet respectively, while the standard width of the streets is 42 feet.

The port, which is divided into two sections, east and west, is known as one of the four important ports of trade of Manchoukuo, the value of its exports of coal, Chinese liquors, cereals, salt, cotton fabrics and

Digitized by Google

other things amounting to 1,780,000 taels in 1928.

The vicinity of Ryojun is the old scene of the siege of Port Arthur during the Russo-Japanese War, and a smooth driveway now connects Ryojun and Dairen to take tourists to the old battlefields.

The population of the city is put at 30,000, of which about 12,000 are Japanese nationals.

Yingkow Before the opening of Dairen, Yingkow was the only commercial port of Manchuria, and it enjoyed great prosperity. It is now known mostly as an industrial centre manufacturing bean oil, tobacco, brick and soy sauce.

Being situated on the bank of the Liao River about 14 miles from its mouth, this town still plays an important rôle in the commerce of the river, meeting the needs of the rural populace along its banks. The town on the opposite bank of the river is known as Newchwang.

The population of the Japanese section of the city is put as 5,300, of which 3,000 are Japanese coming from Japan proper.

Kirin Standing on the western bank of the Sungari River, Kirin is the terminus of the Kirin-Changchun Railway and is known as an important station in the transportation of lumber produced in the upper basin of the river.

Being one of the largest cities in Manchoukuo, it has a population of 160,000, of which about 1,200 are Japanese. As the city is kept comparatively clean, surrounded by shapely hills, Kirin is known among Japanese as the Kyoto of Manchuria. Among other products marketed in this city are lumber, tobacco leaf, hemp and furs.

Harbin Harbin is situated on the eastern bank of the Sungari River, at 44.5 degrees North Latitude and 126.40 degrees East Longitude. Although now known as the Paris of the Far East, Harbin was only a deserted village before the Russian penetration into Manchuria.

Built in European style, the city has a population of 320,000, of which 240,000 are Chinese, 81,000 Russians and 4,700 Japanese.

From this city, the southern line of the North Manchuria Railway runs to Hsinking on an eight-hour schedule. The city also forms an important point in the long railway which links Vladivostok and the cities of Europe via Siberia.

As the largest commercial and industrial centre of North Manchuria, Harbin handles more than 4,000,000 tons of soy beans, wheat, bean-cake and other products annually.

The city is divided into three sections: Old Harbin, the new city and the open town. The new city is said to have been planned after Moscow. The railway station, the offices of the North Manchuria Railway and the foreign consulates are located in this section.

In the open town, which is the commercial section of the city, reside Russian, Japanese and Chinese merchants engaged in thriving business activities. The Harbin offices of the Yokohama Specie Bank, the Chosen Bank and Mitsui Company are found in the open town.

Leased Territory of Kwantung

General and Historical The Leased Territory of Kwantung Province under Japanese rule which was ceded to Japan by Russia and the lease of which lasts till 1997, together with the railway zone of the South Manchuria Railway Company, forms the most civilized area of Manchuria with all kinds of modern facilities introduced by the Japanese.

Occupying a small southern portion of Liaotung Peninsula, the Leased Territory covers an area of some

Digitized by Google

3,367.88 square kilometres with a population of 1,408,755 at the end of 1933, of which 278,989 are Japanese, 1,097,541 Chinese and Manchous and 2,185 of other nationalities.

Government The government of the Kwantung Leased Territory at Ryojun is in charge of the civil administration within the leased territory.

In the beginning the territory was under military rule with an army officer as governor-general. This system was changed in 1919, and since then a civilian officer was appointed governor of the territory by the Emperor of Japan. A drastic change was made in this system on December 26, 1934, in which the Kanto Bureau was established at Hsinking under the control of the Commander of the Kwantung army, and most of the administrative powers formerly vested in the governor of the Leased Territory was transferred to the president of the newly created Bureau. The president takes charge of the civil administration within the territory and supervises the business of the South Manchuria Railway Co.

The present government of the Kwantung Leased Territory at Ryojun is divided into eight departments including the Governor's Secretariat, the Home Affairs Bureau, the Police Administration Bureau, the Finance Bureau, the Local Administration Offices, the Courts of Justice, the Procurators' Office and the Communications Bureau.

In addition to these bureaux, the prisons, the Marine Bureau, the Ryojun Engineering College, the middle schools, the girls' high schools, the normal school for natives, the commercial school for natives, the agricultural schools for natives, the Police Training School, the Meteorological Observatory, the government hospitals, the Agricultural Experimental Station, the Sericultural Experimental Station and several other institutions in the territory are under direct control of the government of the Kwantung Leased Territory.

Finance The expenditure of the Kwantung government continued to increase until 1929-1930, but in the following year considerable retrenchment was effected owing to the economic depression then prevailing the world over.

To be more exact, the expenditure of this government increased from ¥3,451,487 in 1907-1908 to ¥15,217,555 in 1922-1923, continuing to mount till it reached ¥22,576,468 in 1929-1930, but it dropped to ¥19,870,876 in 1930-1931, increasing again to ¥20,899,000 in 1931-1932 and to ¥24,738,000 in the budgetary estimates for 1935-1936.

Of the estimated expenditure for 1935-1936, about ¥3,022,000 was to be expended for the postal, telegraph and telephone services and ¥4,432,000 for the police service. Other important appropriations included ¥2,251,000 for educational purposes and ¥2,036,000 for public undertakings.

Justice and Communication In regard to the administration of justice in the Leased Territory, the system of the courts of justice was established in 1906 to adjudicate in all civil and criminal cases, irrespective of the nationalities of the persons involved.

The defence of the Leased Territory is secured by a neutral zone along the northern frontier.

The communications system and educational, hygienic and other modern institutions are well organized in the territory. In matters concerning hygiene and sanitation, the Kwantung government is collaborating with the South Manchuria Railway Company.

THE CONSTITUTION

CHAPTER I

THE EMPEROR

ARTICLE I The Empire of Japan shall be reigned over and governed by a line of Emperors unbroken for ages eternal.

ARTICLE II The Imperial Throne shall be succeeded to by Imperial male descendants, according to the provisions of the Imperial House Law.

ARTICLE III The Emperor is sacred and inviolable.

ARTICLE IV The Emperor is the head of the Empire, combining in Himself the rights of sovereignty, and exercises them according to the provisions of the present Constitution.

ARTICLE V The Emperor exercises the legislative power with the consent of the Imperial Diet.

ARTICLE VI The Emperor gives sanction to laws, and orders them to be promulgated and executed.

ARTICLE VII The Emperor convokes the Imperial Diet, opens, closes and prorogues it, and dissolves the House of Representatives.

ARTICLE VIII The Emperor, in consequence of an urgent necessity to maintain public safety or to avert public calamities, issues, when the Imperial Diet is not sitting, Imperial Ordinances in the place of law.

Such Imperial Ordinances are to be laid before the Imperial Diet at its next session, and when the Diet does not approve the said Ordinances, the Government shall declare them to be invalid for the future.

ARTICLE IX The Emperor issues, or causes to be issued, the Ordinances necessary for the carrying out of the laws, or for the maintenance of the public peace and order, and for the promotion of the welfare of the subjects. But no Ordinance shall in any way alter any of the existing laws.

ARTICLE X The Emperor determines the organization of the different branches of the administration, and salaries of all civil and military officers, and appoints and dismisses the same. Exceptions especially provided for in the present Constitution or in other laws shall be in accordance with the respective provisions bearing thereon.

ARTICLE XI The Emperor has the supreme command of the Army and Navy.

ARTICLE XII The Emperor determines the organization and peace standing of the Army and Navy.

ARTICLE XIII The Emperor declares war, makes peace, and concludes treaties.

ARTICLE XIV The Emperor declares a state of siege.

The conditions and effects of a state of siege shall be determined by law.

ARTICLE XV The Emperor confers titles of nobility, rank, orders and other marks of honour.

ARTICLE XVI The Emperor orders amnesty, pardon, commutation of punishments and rehabilitation.

ARTICLE XVII A Regency shall be instituted in conformity with the provisions of the Imperial House Law.

The Regent shall exercise the powers appertaining to the Emperor in His name.

CHAPTER II

RIGHTS AND DUTIES OF SUBJECTS

ARTICLE XVIII The conditions necessary for being a Japanese subject shall be determined by law.

ARTICLE XIX Japanese subjects may, according to qualifications determined in laws or ordinances, be appointed to civil or military or any other public offices equally.

Digitized by Google

ARTICLE XX Japanese subjects are amenable to service in the Army or Navy according to the provisions of law.

ARTICLE XXI Japanese subjects are amenable to the duty of paying taxes according to the provisions of law.

ARTICLE XXII Japanese subjects shall have the liberty of abode and of changing the same within the limits of law.

ARTICLE XXIII No Japanese subject shall be arrested, detained, tried or punished, unless according to law.

ARTICLE XXIV No Japanese subject shall be deprived of his right of being tried by the judges determined by law.

ARTICLE XXV Except in the cases provided for in the law, the house of no Japanese subject shall be entered or searched without his consent.

ARTICLE XXVI Except in the cases mentioned in the law, the secrecy of the letters of every Japanese subject shall remain inviolate.

ARTICLE XXVII The right of property of every Japanese subject shall remain inviolate.

Measures necessary to be taken for the public benefit shall be provided for by law.

ARTICLE XXVIII Japanese subjects shall, within limits not prejudicial to peace and order, and not antagonistic to their duties as subjects, enjoy freedom of religious belief.

ARTICLE XXIX Japanese subjects shall, within the limits of law, enjoy the liberty of speech, writing, publication, public meetings and associations.

ARTICLE XXX Japanese subjects may present petitions, by observing the proper forms of respect, and by complying with the rules specially provided for the same.

ARTICLE XXXI The provisions contained in the present chapter shall not affect the exercise of the powers appertaining to the Emperor, in times of war or in cases of a national emergency.

ARTICLE XXXII Each and every one of the provisions contained in the preceding Articles of the present chapter, that are not in conflict with the laws or the rules and discipline of the Army and Navy, shall apply to the officers and men of the Army and of the Navy.

CHAPTER III

THE IMPERIAL DIET

ARTICLE XXXIII The Imperial Diet shall consist of two Houses, a House of Peers and a House of Representatives.

ARTICLE XXXIV The House of Peers shall, in accordance with the Ordinance concerning the House of Peers, be composed of the members of the Imperial Family, of the orders of nobility, and of those persons who have been nominated thereto by the Emperor.

ARTICLE XXXV The House of Representatives shall be composed of Members elected by the people according to the provisions of the Law of Election.

ARTICLE XXXVI No one can at one and the same time be a Member of both Houses.

ARTICLE XXXVII Every law requires the consent of the Imperial Diet.

ARTICLE XXXVIII Both Houses shall vote upon projects of law submitted to them by the Government, and may respectively initiate projects of law.

ARTICLE XXXIX A Bill which has been rejected by either the one or the other of the two Houses shall not be again brought in during the same session.

ARTICLE XL Both Houses can make representations to the Government as to laws or upon any other subject. When, however, such representations are not accepted, they cannot be made a second time during the same session.

ARTICLE XLI The Imperial Diet shall be convoked every year.

ARTICLE XLII A session of the Imperial Diet shall last during three months. In case of necessity, the duration of a session may be prolonged by Imperial Order.

ARTICLE XLIII When urgent necessity arises, an extraordinary session may be convoked in addition to the ordinary one.

Digitized by Google

The duration of an extraordinary session shall be determined by Imperial Order.

ARTICLE XLIV The opening, closing, prolongation of session and prorogation of the Imperial Diet, shall be effected simultaneously for both Houses.

In case the House of Representatives has been ordered to dissolve, the House of Peers shall at the same time be prorogued.

ARTICLE XLV When the House of Representatives has been ordered to dissolve, Members shall be caused by Imperial Order to be newly elected, and the new House shall be convoked within five months from the day of dissolution.

ARTICLE XLVI No debate can be opened and no vote can be taken in either House of the Imperial Diet, unless not less than one-third of the whole number of the Members thereof is present.

ARTICLE XLVII Votes shall be taken in both Houses by absolute majority. In the case of a tie vote, the President shall have the casting vote.

ARTICLE XLVIII The deliberations of both Houses shall be held in public. The deliberations may, however, upon demand of the Government or by resolution of the House, be held in secret sitting.

ARTICLE XLIX Both Houses of the Imperial Diet may respectively present addresses to the Emperor.

ARTICLE L Both Houses may receive petitions presented by subjects.

ARTICLE LI Both Houses may enact, besides what is provided for in the present Constitution and in the Law of the Houses, rules necessary for the management of their internal affairs.

ARTICLE LII No Member of either House shall be held responsible outside the respective Houses for any opinion uttered or for any vote given in the House. When, however, a Member himself has given publicity to his opinions by public speech, by documents in print or in writing, or by any other similar means, he shall, in the matter, be amenable to the general law.

ARTICLE LIII The Members of both Houses shall, during the session, be free from arrest, unless with the consent of the House, except in cases of flagrant delicts, or of offences connected with a state of internal commotion or with a foreign trouble.

ARTICLE LIV The Ministers of State and the Delegates of the Government may, at any time, take seats and speak in either House.

CHAPTER IV

THE MINISTERS OF STATE AND THE PRIVY COUNCIL

ARTICLE LV The respective Ministers of State shall give their advice to the Emperor, and be responsible for it.

All Laws, Imperial Ordinances and Imperial Rescripts of whatever kind, that relate to the affairs of the State, require the countersignature of a Minister of State.

ARTICLE LVI The Privy Councillors shall, in accordance with the provisions for the organization of the Privy Council, deliberate upon important matters of State, when they have been consulted by the Emperor.

CHAPTER V

THE JUDICATURE

ARTICLE LVII The Judicature shall be exercised by the Courts of Law according to law, in the name of the Emperor.

The organization of the Courts of Law shall be determined by law.

ARTICLE LVIII The judges shall be appointed from among those who possess proper qualifications according to law.

No judge shall be deprived of his position, unless by way of criminal sentence or disciplinary punishment.

Rules for disciplinary punishment shall be determined by law.

ARTICLE LIX Trials and judgments of a Court shall be conducted publicly. When, however, there exists any fear, that such publicity may be prejudicial to peace and order, or to the maintenance of public morality, the public trial may be suspended by provision of law or by the decision of the Court of Law.

Digitized by Google

ARTICLE LX All matters, that fall within the competency of a special Court, shall be specially provided for by law.

ARTICLE LXI No suit at law, which relates to rights alleged to have been infringed by the illegal measures of the administrative authorities, and which shall come within the competency of the Court of Administrative Litigation specially established by law, shall be taken cognizance of by a Court of Law.

CHAPTER VI

FINANCE

ARTICLE LXII The imposition of a new tax or the modification of the rates of an existing one shall be determined by law.

However, all such administrative fees or other revenue having the nature of compensation shall not fall within the category of the above clause.

The raising of national loans and the contracting of other liabilities to the charge of the National Treasury, except those that are provided in the Budget, shall require the consent of the Imperial Diet.

ARTICLE LXIII The taxes levied at present shall, in so far as they are not remodelled by a new law, be collected according to the old system.

ARTICLE LXIV The expenditure and revenue of the State require the consent of the Imperial Diet by means of an annual Budget.

Any and all expenditures overpassing the appropriations set forth in the Titles and Paragraphs of the Budget, or that are not provided for in the Budget, shall subsequently require the approbation of the Imperial Diet.

ARTICLE LXV The Budget shall be first laid before the House of Representatives.

ARTICLE LXVI The expenditures of the Imperial House shall be defrayed every year out of the National Treasury, according to the present fixed amount for the same, and shall not require the consent thereto of the Imperial Diet, except in case an increase thereof is found necessary.

ARTICLE LXVII Those already fixed expenditures based by the Constitution upon the powers appertaining to the Emperor, and such expenditures as may have arisen by the effect of law, or that appertain to the legal obligations of the Government, shall be neither rejected nor reduced by the Imperial Diet, without the concurrence of the Government.

ARTICLE LXVIII In order to meet special requirements, the Government may ask the consent of the Imperial Diet to a certain amount as a Continuing Expenditure Fund, for a previously fixed number of years.

ARTICLE LXIX In order to supply deficiencies, which are unavoidable, in the Budget, and to meet requirements unprovided for in the same, a Reserve Fund shall be provided in the Budget.

ARTICLE LXX When the Imperial Diet cannot be convoked, owing to the external or internal condition of the country, in case of urgent need for the maintenance of public safety, the Government may take all necessary financial measures, by means of an Imperial Ordinance.

In the case mentioned in the preceding clause, the matter shall be submitted to the Imperial Diet at its next session, and its approbation shall be obtained thereto.

ARTICLE LXXI When the Imperial Diet has not voted on the Budget, or when the Budget has not been brought into actual existence, the Government shall carry out the Budget of the preceding year.

ARTICLE LXXII The final account of the expenditures and revenue of the State shall be verified and confirmed by the Board of Audit, and it shall be submitted by the Government to the Imperial Diet, together with the report of verification of the said Board.

The organization and competency of the Board of Audit shall be determined by law separately.

CHAPTER VII

SUPPLEMENTARY RULES

ARTICLE LXXIII When it has become necessary in future to amend the

Digitized by Google

provisions of the present Constitution, a project to that effect shall be submitted to the Imperial Diet by Imperial Order.

In the above case, neither House can open the debate, unless not less than two-thirds of the whole number of Members are present, and no amendment can be passed, unless a majority of not less than two-thirds of the Members present is obtained.

ARTICLE LXXIV No modification of the Imperial House Law shall be required to be submitted to the deliberation of the Imperial Diet.

No provision of the present Constitution can be modified by the Imperial House Law.

ARTICLE LXXV No modification can be introduced into the Constitution, or into the Imperial House Law, during the time of a Regency.

ARTICLE LXXVI Existing legal enactments, such as laws, regulations, Ordinances, or by whatever names they may be called, shall, so far as they do not conflict with the present Constitution, continue in force.

All existing contracts or orders, that entail obligations upon the Government, and that are connected with expenditure, shall come within the scope of Art. LXVII.

THE IMPERIAL HOUSE LAW

CHAPTER I

SUCCESSION TO THE IMPERIAL THRONE

ARTICLE I The Imperial Throne of Japan shall be succeeded to by male descendants in the male line of Imperial Ancestors.

ARTICLE II The Imperial Throne shall be succeeded to by the Imperial eldest son.

ARTICLE III When there is no Imperial eldest son, the Imperial Throne shall be succeeded to by the Imperial eldest grandson. When there is neither Imperial eldest son nor any male descendant of his, it shall be succeeded to by the Imperial son next in age, and so on in every successive case.

ARTICLE IV For succession to the Imperial Throne by an Imperial descendant, the one of full blood shall have precedence over descendants of half blood. The succession to the Imperial Throne by the latter shall be limited to those cases only, when there is no Imperial descendant of full blood.

ARTICLE V When there is no Imperial descendant, the Imperial Throne shall be succeeded to by an Imperial brother and by his descendants.

ARTICLE VI When there is no such Imperial brother or descendant of his, the Imperial Throne shall be succeeded to by an Imperial uncle and by his descendants.

ARTICLE VII When there is neither such Imperial uncle nor descendant of his, the Imperial Throne shall be succeeded to by the next nearest member among the rest of the Imperial Family.

ARTICLE VIII Among the Imperial brothers and the remoter Imperial relations, precedence shall be given, in the same degree, to the descendants of full blood over those of half blood, and to the elder over the younger.

ARTICLE IX When the Imperial heir in suffering from an incurable disease of mind or body, or when any other weighty cause exists, the order of succession may be changed in accordance with the foregoing provisions, with the advice of the Imperial Family Council and with that of the Privy Council.

CHAPTER II

ASCENSION AND CORONATION

ARTICLE X Upon the demise of the Emperor, the Imperial heir shall ascend the Throne, and shall aquire the Divine Treasures of the Imperial Ancestors.

ARTICLE XI The ceremonies of Coronation shall be performed and a Grand Coronation Banquet (Daijosai) shall be

Digitized by Google

held at Kyoto.

ARTICLE XII Upon an ascension to the Throne, a new era shall be inaugurated, and the name of it shall remain unchanged during the whole reign, in agreement with the established rule of the 1st year of Meiji.

CHAPTER III

MAJORITY. INSTITUTION OF EMPRESS AND OF HEIR-APPARENT

ARTICLE XIII The Emperor, the Kotaishi and the Kotaison shall attain their majority at eighteen full years of age.

ARTICLE XIV Members of the Imperial Family, other than those mentioned in the preceding Article, shall attain their majority at twenty full years of age.

ARTICLE XV The son of the Emperor, who is Heir-apparent, shall be called "Kotaishi." In case there is no Kotaishi, the Imperial grandson, who is Heir-apparent, shall be called "Kotaison."

ARTICLE XVI The institution of Empress and that of Kotaishi or of Kotaison shall be proclaimed by an Imperial Rescript.

CHAPTER IV

STYLES OF ADDRESS

ARTICLE XVII The style of address for the Emperor, the Grand Empress Dowager, the Empress Dowager and of the Empress, shall be His, or Her or Your Majesty.

ARTICLE XVIII The Kotaishi and his consort, the Kotaison and his consort, the Imperial Princes and their consorts, the Imperial Princesses, the Princes and their consorts, and the Princesses shall be styled His, Her, Their, or Your Highness or Highnesses.

CHAPTER V

REGENCY

ARTICLE XIX When the Emperor is a minor, a Regency shall be instituted. When He is prevented by some permanent cause from personally governing, a Regency shall be instituted, with the advice of the Imperial Family Council and with that of the Privy Council.

ARTICLE XX The Regency shall be assumed by the Kotaishi or the Kotaison, being of full age of majority.

ARTICLE XXI When there is neither Kotaishi nor Kotaison, or when the Kotaishi or the Kotaison has not yet arrived at his majority, the Regency shall be assumed in the following order:

1. An Imperial Prince or a Prince.
2. The Empress.
3. The Empress Dowager.
4. The Grand Empress Dowager.
5. An Imperial Princess or a Princess.

ARTICLE XXII In case the Regency is to be assumed from among the male members of the Imperial Family, it shall be done in agreement with the order of succession to the Imperial Throne. The same shall apply to the case of female members of the Imperial Family.

ARTICLE XXIII A female member of the Imperial Family to assume the Regency shall be exclusively one who has no consort.

ARTICLE XXIV When, on account of the minority of the nearest related member of the Imperial Family, or for some other cause, another member has to assume the Regency, the latter shall not, upon the arrival at majority of the above mentioned nearest related member, or upon the disappearance of the aforesaid cause, resign his or her post in favour of any person other than of the Kotaishi or of the Kotaison.

ARTICLE XXV When a Regent or one who should become such, is suffering from an incurable disease of mind or body, or when any other weighty cause exists therefor, the order of the Regency may be changed, with the advice of the Imperial Family Council and with that of the Privy Council.

CHAPTER VI

THE IMPERIAL GOVERNOR

ARTICLE XXVI When the Emperor is a minor, an Imperial Governor shall

Digitized by Google

be appointed to take charge of His bringing up and of His education.

ARTICLE XXVII In case no Imperial Governor has been nominated in the will of the preceding Emperor, the Regent shall appoint one, with the advice of the Imperial Family Council and with that of the Privy Council.

ARTICLE XXVIII Neither the Regent nor any of his descendants can be appointed Imperial Governor.

ARTICLE XXIX The Imperial Governor can not be removed from his post by the Regent, unless upon the advice of the Imperial Family Council and upon that of the Privy Council.

CHAPTER VII

THE IMPERIAL FAMILY

ARTICLE XXX The term "Imperial Family" shall include the Grand Empress Dowager, the Empress Dowager, the Empress, the Kotaishi and his consort, the Kotaison and his consort, the Imperial Princes and their consorts, the Imperial Princesses, the Princes and their consorts, and the Princesses.

ARTICLE XXXI From Imperial sons to Imperial great-great-grandsons, Imperial male descendants shall be called Imperial Princes; and from Imperial daughters to Imperial great-great-granddaughters, Imperial female descendants shall be called Imperial Princesses. From the fifth generation downwards, they shall be called, male descendants, Princes, female ones, Princesses.

ARTICLE XXXII When the Imperial Throne is succeeded to by a member of a branch line, the title of Imperial Prince or Imperial Princess shall be specially granted to the Imperial brothers and sisters, being already Princes or Princesses.

ARTICLE XXXIII The births, namings, marriages and deaths in the Imperial Family shall be announced by the Minister of the Imperial Household.

ARTICLE XXXIV Genealogical and other records relating to the matters mentioned in the preceding Article shall be kept in the Imperial archives.

ARTICLE XXXV The members of the Imperial Family shall be under the control of the Emperor.

ARTICLE XXXVI When a Regency is instituted, the Regent shall exercise the power of control referred to in the preceding Article.

ARTICLE XXXVII When a member, male or female, of the Imperial Family is a minor and has been bereft of his or her father, the officials of the Imperial Court shall be ordered to take charge of his or her bringing up and education. Under certain circumstances, the Emperor may either approve the guardian chosen by his or her parent, or may nominate one.

ARTICLE XXXVIII The guardian of a member of the Imperial Family must be himself a member thereof and of age.

ARTICLE XXXIX Marriages of members of the Imperial Family shall be restricted to the circle of the Family, or to certain noble families specially approved by Imperial Order.

ARTICLE XL Marriages of the members of the Imperial Family shall be subject to the sanction of the Emperor.

ARTICLE XLI The Imperial writs sanctioning the marriages of members of the Imperial Family shall bear the countersignature of the Minister of the Imperial Household.

ARTICLE XLII No member of the Imperial Family can adopt any one as his son.

ARTICLE XLIII When a member of the Imperial Family wishes to travel beyond the boundaries of the Empire, he shall first obtain the sanction of the Emperor.

ARTICLE XLIV A female member of the Imperial Family, who has married a subject, shall be excluded from membership of the Imperial Family. However, she may be allowed, by the special grace of the Emperor, to retain her title of Imperial Princess or of Princess, as the case may be.

CHAPTER VIII

IMPERIAL HEREDITARY ESTATES

ARTICLE XLV No landed or other property that has been fixed as the Imperial Hereditary Estates shall be divided up and alienated.

Digitized by Google

ARTICLE XLVI The landed and other property to be included in the Imperial Hereditary Estates shall be settled by Imperial writ, with the advice of the Privy Council, and shall be announced by the Minister of the Imperial Household.

CHAPTER IX

EXPENDITURES OF THE IMPERIAL HOUSE

ARTICLE XLVII The expenditures of the Imperial House of all kinds shall be defrayed out of the National Treasury at a certain fixed amount.

ARTICLE XLVIII The estimates and audit of accounts of the expenditures of the Imperial House and all other rules of the kind shall be regulated by the Finance Regulations of the Imperial House.

CHAPTER X

LITIGATIONS. DISCIPLINARY RULES FOR THE MEMBERS OF THE IMPERIAL FAMILY

ARTICLE XLIX Litigation between members of the Imperial Family shall be decided by judicial functionaries specially designated by the Emperor to the Department of the Imperial Household, and execution issued, after Imperial sanction thereto has been obtained.

ARTICLE L Civil actions brought by private individuals against members of the Imperial Family, shall be decided in the Court of Appeal in Tokyo. Members of the Imperial Family shall, however, be represented by attorneys, and no personal attendance in the Court shall be done in agreement with the

ARTICLE LI No member of the Imperial Family can be arrested, or summoned before a Court of Law, unless the sanction of the Emperor has been first obtained thereto.

ARTICLE LII When a member of the Imperial Family has committed an act derogatory to his (or her) dignity, or when he has exhibited disloyalty to the Imperial House, he shall, by way of disciplinary punishment and by order of the Emperor, be deprived of the whole or a part of the privileges belonging to him as a member of the Imperial Family, or shall be suspended therefrom.

ARTICLE LIII When a member of the Imperial Family acts in a way tending to the squandering of his (or her) property, he shall be pronounced incapable by the Emperor, prohibited from administering his property, and a manager shall be appointed therefor.

ARTICLE LIV The two foregoing Articles shall be enforced upon the advice of the Imperial Family Council.

CHAPTER XI

THE IMPERIAL FAMILY COUNCIL

ARTICLE LV The Imperial Family Council shall be composed of the male members of the Imperial Family, who have reached the age of majority. The Lord Keeper of the Privy Seal, the President of the Privy Council, the Minister of the Imperial Household, the Minister of State for Justice and the President of the Court of Cassation shall be ordered to take part in the deliberations of the Council.

ARTICLE LVI The Emperor personally presides over the meeting of the Imperial Family Council, or directs one of the members of the Imperial Family to do so.

CHAPTER XII

SUPPLEMENTARY RULES

ARTICLE LVII Those of the present members of the Imperial Family of the fifth generation and downwards, who have already been invested with the title of Imperial Prince, shall retain the same as heretofore.

ARTICLE LVIII The order of succession to the Imperial Throne shall in every case relate to the descendants of absolute lineage. There shall be no admission to this line of succession for any one, as a consequence of his being an adopted Imperial son, Koyushi or heir to a princely house.

ARTICLE LIX The grades of rank among the Imperial Princes, Imperial Princesses, Princes and Princesses shall

Digitized by Google

be abolished.

ARTICLE LX The family rank of Imperial Princes and all usages conflicting with the present Law shall be abolished.

ARTICLE LXI The property, annual expenses and all other rules concerning the members of the Imperial Family shall be specially determined.

ARTICLE LXII When in the future it shall become necessary either to amend or make additions to the present Law, the matter shall be decided by the Emperor, with the advice of the Imperial Family Council, and with that of the Privy Council.

A SUPPLEMENT TO THE IMPERIAL HOUSE LAW

(February 11, 1907)

ARTICLE I A Prince may be granted a family name and be caused to join the order of nobility by Imperial Order or through a petition.

ARTICLE II A Prince may become, by obtaining the sanction of the Emperor, the successor to the headship of a noble family, or be adopted into a noble family, with the object of succeeding to its headship.

ARTICLE III The wife and direct descendants of a Prince, who has, in accordance with the two preceding Articles, become a subject, and the wives of such descendants, enter such subject's family. This rule does not apply, however, to females married to other members of the Imperial Family and the direct descendants of such females.

ARTICLE IV A member of the Imperial Family, who has been deprived of its privileges may, by Imperial order, be caused to descend to the status of subject.

ARTICLE V The cases provided for in Articles I, II, and IV (of the supplementary law) shall be subject to the advice of the Imperial Family Council and that of the Privy Council.

ARTICLE VI A member of the Imperial Family who has become a subject can not be restored into the Imperial Family.

ARTICLE VII Regulations relating the personal status and other rights and duties of members of the Imperial Family, shall be especially determined besides those prescribed in the present Law.

The regulations referred to in the preceding clause apply when a member of the Imperial Family and a private individual are parties to a matter, concerning which different rules are provided to apply to such parties respectively.

ARTICLE VIII Provisions in Laws and Ordinances, which are set down as applicable to members of the Imperial Family, shall be applicable only when there are no special provisions in the present Law or in Regulations that may be issued in conformity with the present Law.

A SUPPLEMENT TO THE IMPERIAL HOUSE LAW

(November 28, 1918)

A female member of the Imperial Family may marry a Prince of the principal House or of the branch Houses of the Ri Family.

LIST OF EMPERORS

No. of Reign	Emperor	Year Name (with its duration in parenthesis)	Duration of Reign
1	JIMMU	(B. C.)	660-581

TREATY FOR THE RENUNCIATION OF WAR

Signed at Paris, August 26, 1929

ARTICLE I The High Contracting Parties solemnly declare in the name of their respective peoples that they condemn recourse to war for the solution of international controversies, and renounce it as an instrument of national

Digitized by Google

policy in their relations with one another.

ARTICLE II The High Contracting Parties agree that the settlement or solution of all disputes or conflicts of whatever nature or of whatever origin they may be, which may arise among them, shall never be sought except by pacific means.

ARTICLE III The present Treaty shall be ratified by the High Contracting Parties named in the Preamble in accordance with their respective constitutional requirements, and shall take effect as between them as soon as all their several instruments of ratification shall have been deposited at Washington.

This Treaty shall, when it has come into effect as prescribed in the preceding paragraph, remain open as long as may be necessary for adherence by all the other Powers of the world. Every instrument evidencing the adherence of a Power shall be deposited at Washington and the Treaty shall immediately upon such deposit become effective as between the Power thus adhering and the other Powers parties hereto.

It shall be the duty of the Government of the United States to furnish each Government named in the Preamble and every Government subsequently adhering to this Treaty with a certified copy of the Treaty and of every instrument of ratification or adherence. It shall also be the duty of the Government of the United States telegraphically to notify such Governments immediately upon the deposit with it of each instrument of ratification or adherence.

TREATY BETWEEN THE NINE POWERS CONCERNING CHINA

Signed at Washington February 6, 1922

ARTICLE I The Contracting Powers, other than China, agree :

(1) To respect the sovereignty, the independence, and the territorial and administrative integrity of China ;

(2) To provide the fullest and most unembarrassed opportunity to China to develop and maintain for herself an effective and stable government ;

(3) To use their influence for the purpose of effectually establishing and maintaining the principle of equal opportunity for the commerce and industry of all nations through the territory of China ;

(4) To refrain from taking advantage of conditions in China in order to seek special rights or privileges which would abridge the rights of subjects or citizens of friendly States, and from countenancing action inimical to the security of such States.

ARTICLE II The Contracting Powers agree not to enter into any treaty, agreement, arrangement, or understanding, either with one another, or individually or collectively, with any Power or Powers, which would infringe or impair the principles stated in Article I.

ARTICLE III With a view to applying more effectually the principles of the Open Door or equality of opportunity in China for the trade and industry of all nations, the Contracting Powers, other than China, agree that they will not seek, nor support their respective nationals in seeking :—

(a) any arrangement which might purport to establish in favour of their interest any general superiority of rights with respect to commercial or economic development in any designated region of China ;

(b) any such monopoly or preference as would deprive the nationals of any other Power of the right of undertaking any legitimate trade or industry in China, or of participating with the Chinese Government, or with any local authority, in any category of public enterprise, or which by reason of its scope, duration or geographical extent is calculated to frustrate the practical application of the principle of equal opportunity.

It is understood that the foregoing stipulations of this Article are not to be so construed as to prohibit the ac-

quisition of such properties or rights as may be necessary to the conduct of a particular commercial, industrial, or financial undertaking or to the encouragement of invention and research.

China undertakes to be guided by the principles stated in the foregoing stipulations of this Article in dealing with applications for economic rights and privileges from Governments and nationals of all foreign countries, whether parties to the present Treaty or not.

ARTICLE IV The Contracting Powers agree not to support any agreements by their respective nationals with each other designed to create Spheres of Influence or to provide for the enjoyment of mutually exclusive opportunities in designated parts of Chinese territory.

ARTICLE V China agrees that, throughout the whole of the railways in China, she will not exercise or permit unfair discrimination of any kind. In particular there shall be no discrimination whatever, direct or indirect, in respect of charges or of facilities on the ground of the nationality of passengers or the countries from which or to which they are proceeding, or the origin or ownership of goods or the country from which or to which they are consigned, or the nationality or ownership of the ship or other means of conveying such passengers or goods before or after their transport on the Chinese Railways.

The Contracting Powers, other than China, assume a corresponding obligation in respect of any of the aforesaid railways over which they or their nationals are in a position to exercise any control in virtue of any concession, special agreement or otherwise.

ARTICLE VI The Contracting Powers, other than China, agree fully to respect China's rights as a neutral in time of war to which China is not a party; and China declares that when she is a neutral she will observe the obligations of neutrality.

ARTICLE VII The Contracting Powers agree that, whenever a situation arises which in the opinion of any one of them involves the application of the stipulations of the present Treaty, and renders desirable discussion of such application, there shall be full and frank communication between the Contracting Powers concerned.

ARTICLE VIII Powers not signatory to the present Treaty, which have Governments recognized by the Signatory Powers and which have treaty relations with China, shall be invited to adhere to the present Treaty. To this end the Government of the United States will make necessary communications to non-signatory Powers and will inform the Contracting Powers of the replies received. Adherence by any Power shall become effective on receipt of notice thereof by the Government of the United States.

TREATY BETWEEN THE FOUR POWERS CONCERNING THEIR INSULAR POSSESSIONS AND INSULAR DOMINIONS IN THE REGION OF THE PACIFIC OCEAN

Signed at Washington December 13, 1921

AND

SUPPLEMENTARY AGREEMENT

Signed at Washington, February 6, 1922

I

The High Contracting Parties agree as between themselves to respect their rights in relation to their insular possessions and insular dominions in the region of the Pacific Ocean.

If there should develop between any of the High Contracting Parties a controversy arising out of any Pacific question and involving their said rights which is not satisfactorily settled by diplomacy and is likely to affect the harmonious accord now happily subsist-

Digitized by Google

ing between them, they shall invite the other High Contracting Parties to a joint conference to which the whole subject will be referred for consideration and adjustment.

II

If the said rights are threatened by the aggressive action of any other Power, the High Contracting Parties shall communicate with one another fully and frankly in order to arrive at an understanding as to the most efficient measures to be taken, jointly or separately, to meet the exigencies of the particular situation.

III

This Treaty shall remain in force for ten years from the time it shall take effect, and after the expiration of said period it shall continue to be in force subject to the right of any of the High Contracting Parties to terminate it upon twelve months' notice.

IV

This Treaty shall be ratified as soon as possible in accordance with the constitutional methods of the High Contracting Parties and shall take effect on the deposit of ratifications, which shall take place at Washington, and thereupon the agreement between Great Britain and Japan, which was concluded at London on July 13, 1911, shall terminate. The Government of the United States will transmit to all the Signatory Powers a certified copy of the proces-verbal of the deposit of ratifications.

The present Treaty, in French and in English, shall remain deposit in the archives of the Government of the United States, and duly certified copies thereof will be transmitted by that Government to each of the Signatory Powers.

TREATY BETWEEN JAPAN AND THE UNITED STATES OF AMERICA CONCERNING THE ISLAND OF YAP AND OTHER MANDATED ISLANDS SITUATED IN THE PACIFIC OCEAN AND LYING NORTH OF THE EQUATOR

Signed at Washington, February 11, 1922

Considering that by Article 119 of the Treaty of Versailles, signed on June 28, 1919, Germany renounced in favour of the Powers described in that Treaty as the Principal Allied and Associated Powers, to wit, the United States of America, the British Empire, France, Italy and Japan, all her rights and titles over her oversea possessions ;

Considering that the benefits accruing to the United States under the aforesaid Article 119 of the Treaty of Versailles were confirmed by the Treaty between the United States and Germany, signed on August 25, 1921, to restore friendly relations between the two nations ;

Considering that the said four Powers, to wit, the British Empire, France, Italy and Japan, have agreed to confer upon His Majesty the Emperor of Japan a mandate, pursuant to the Treaty of Versailles, to administer the groups of the former German islands in the Pacific Ocean lying north of the Equator, in accordance with the following provisions :

ARTICLE I The islands over which a Mandate is conferred upon His Majesty the Emperor of Japan (hereinafter called the Mandatory) comprise all the former German islands situated in the Pacific Ocean and lying north of the Equator ;

ARTICLE II The Mandatory shall

Digitized by Google

have full power of administration and legislation over the territory subject to the present Mandate as an integral portion of the Empire of Japan, and may apply the laws of the Empire of Japan to the territory, subject to such local modifications as circumstances may require;

The Mandatory shall promote to the utmost the material and moral well-being and the social progress of the inhabitants of the territory subject to the present Mandate;

ARTICLE III The Mandatory shall see that the slave trade is prohibited and that no forced labour is permitted, except for essential public works and services, and then only for adequate remuneration;

The Mandatory shall also see that the traffic in arms and ammunition is controlled in accordance with principles analogous to those laid down in the Convention relating to the control of the arms traffic, signed on September 10th, 1919, or in any convention amending same;

The supply of intoxicating spirits and beverages to the natives shall be prohibited;

ARTICLE IV The military training of the natives, otherwise than for purpose of internal police and the local defence of the territory, shall be prohibited. Furthermore, no military or naval bases shall be established or fortifications erected in the territory;

ARTICLE V Subject to the provisions of any local law for the maintenance of public order and public morals, the Mandatory shall ensure in the territory freedom of conscience and the free exercise of all forms of worship, and shall allow all missionaries, nationals of any State Member of the League of Nations, to enter into, travel and reside in the territory for the purpose of prosecuting their calling;

ARTICLE VI The Mandatory shall make to the Council of the League of Nations an annual report to the satisfaction of the Council, containing full information with regard to the territory, and indicating the measures taken to carry out the obligations assumed under Articles 2, 3, 4, and 5;

ARTICLE VII The consent of the Council of the League of Nations is required for any modification of the terms of the present mandate;

The Mandatory agrees that, if any dispute whatever should arise between the Mandatory and another member of the League of Nations relating to the interpretation or the application of the provision of the Mandate, such dispute, if it cannot be settled by negotiation, shall be submitted to the Permanent Court of International Justice provided for by Article 14 of the Covenant of the League of Nations;

Considering that the United States did not ratify the Treaty of Versailles and did not participate in the agreement respecting the aforesaid Mandate;

Desiring to reach a definite understanding with regard to the rights of the two governments and their respective nationals in the aforesaid islands, and in particular the Island of Yap, have resolved to conclude a Convention for that purpose and to that end have named as their Plenipotentiaries:

His Majesty the Emperor of Japan: Baron Kijuro Shidehara, His Majesty's Ambassador Extraordinary and Plenipotentiary at Washington; and

The President of the United States of America: Charles Evans Hughes, Secretary of State of the United States of America;

Who, after having communicated to each other their respective full powers, found to be in good and due form, have agreed as follows:

ARTICLE I Subject to the provisions of the present Convention, the United States consents to the administration by Japan, pursuant to the aforesaid Mandate, of all the former German islands in the Pacific Ocean, lying north of the Equator.

ARTICLE II The United States and its nationals shall receive all the benefits of the engagements of Japan, defined in Articles 3, 4 and 5 of the aforesaid Mandate, notwithstanding the fact that the United States is not a Member of the League of Nations.

It is further agreed between the High Contracting Parties as follows:

(1) Japan shall insure in the islands complete freedom of conscience and the free exercise of all forms of worship which are consonant with public order

Digitized by Google

and morality; American missionaries of all such religions shall be free to enter the islands and to travel and reside therein, to acquire and possess property, to erect religious buildings and to open schools throughout the islands; it being understood, however, that Japan shall have the right to exercise such control as may be necessary for the maintenance of public order and good government and to take all measures required for such control.

(2) Vested American property rights in the mandated islands shall be respected and in no way impaired;

(3) Existing treaties between the United States and Japan shall be applicable to the mandated islands;

(4) Japan will address to the United States a duplicate of the annual report on the administration of the Mandate to be made by Japan to the Council of the League of Nations;

(5) Nothing contained in the present Convention shall be affected by any modification which may be made in the terms of the Mandate as recited in the Convention, unless such modification shall have been expressly assented to by the United States.

ARTICLE III The United States and its nationals have free access to the Island of Yap on a footing of entire equality with Japan or any other nation and their respective nationals in all that relates to the landing and operation of the existing Yap-Guam cable or of any cable which may hereafter be laid or operated by the United States or by its nationals connecting with the Island of Yap.

The rights and privileges embraced by the preceding paragraph shall also be accorded to the Government of the United States and its nationals with respect to radio-telegraphic communication; provided, however, that so long as the Government of Japan shall maintain on the Island of Yap an adequate radio-telegraphic station, co-operating effectively with the cables and with other radio stations on ships or on shore, without discriminatory exactions or preferences, the exercise of the right to establish radio-telegraphic stations on the Island by the United States or its nationals shall be suspended.

ARTICLE IV In connection with the rights embraced by Article III, specific rights, privileges and exemptions, in so far as they relate to electrical communications, shall be enjoyed in the Island of Yap by the United States and its nationals in terms as follows:

(1) Nationals of the United States shall have the unrestricted right to reside in the Island, and the United States and its nationals shall have the right to acquire and hold on a footing of entire equality with Japan or any other nation or their respective nationals all kinds of property and interests, both personal and real, including lands, buildings, residences, offices, works and appurtenances.

(2) Nationals of the United States shall not be obliged to obtain any permit or license in order to be entitled to land and operate cables on the Island, or to establish radio-telegraphic service, subject to the provisions of Article 3, or to enjoy any of the rights and privileges embraced by this Article and by Article 3.

(3) No censorship or supervision shall be exercised over cable or radio messages or operations.

(4) Nationals of the United States shall have complete freedom of entry and exit in the Island for their persons and property.

(5) No taxes, port, harbour, or landing charges or exactions of any nature whatsoever, shall be levied either with respect to the operation of cables or radio stations, or with respect to property, persons or vessels.

(6) No discriminatory police regulations shall be enforced.

(7) The Government of Japan will exercise its power of expropriation in the Island to secure to the United States or its nationals needed property and facilities for the purpose of electrical communications if such property or facilities cannot otherwise be obtained.

It is understood that the location and the area of land so to be expropriated shall be arranged between the two Governments according to the requirements of each case. Property of the United States or of its nationals and facilities for the purpose of electrical communication in the Island shall not be subject to expropriation.

NOTIFICATION OF THE JAPANESE GOVERNMENT TO THE LEAGUE OF NATIONS

Made Public March 27, 1932

The Japanese Government believe that the national policy of Japan, which has for its aim to insure the peace of the Orient and thereby to contribute to the cause of peace throughout the world, is identical in spirit with the mission of the League of Nations, which is to achieve international peace and security. It has always been with pleasure, therefore, that this country has for thirteen years past, as an original Member of the League, and a permanent Member of its Council, extended a full measure of co-operation with her fellow-Members towards the attainment of its high purpose. It is indeed a matter of historical fact that Japan has continuously participated in the various activities of the League with a zeal not inferior to that exhibited by any other nation. At the same time, it is and has always been the conviction of the Japanese Government that in order to render possible the maintenance of peace in various regions of the world, it is necessary in existing circumstances to allow the operation of the Covenant of the League to vary in accordance with the actual conditions prevailing in each of those regions. Only by acting on this just and equitable principle can the League fulfil its mission and increase its influence.

Acting on this conviction, the Japanese Government, ever since the Sino-Japanese dispute was, in September, 1931, submitted to the League, have, at meetings of the League and on other occasions, continually set forward a consistent view. This was, that if the League was to settle the issue fairly and equitably, and to make a real contribution to the promotion of peace in the Orient, and thus enhance its prestige, it should acquire a complete grasp of the actual conditions in this quarter of the globe and apply the Covenant of the League in accordance with these conditions. They have repeatedly emphasized and insisted upon the absolute necessity of taking into consideration the fact that China is not an organized State,—that its internal conditions and external relations are characterized by extreme confusion and complexity, and by many abnormal and exceptional features,—and that, accordingly, the general principles and usages of International Law which govern the ordinary relations between nations are found to be considerably modified in their operation so far as China is concerned, resulting in the quite abnormal and unique international practices which actually prevail in that country.

However, the majority of the Members of the League evinced in the course of its deliberations during the past seventeen months a failure either to grasp these realities or else to face them and take them into proper account. Moreover, it has frequently been made manifest in these deliberations that there exist serious differences of opinion between Japan and these Powers concerning the application and even the interpretation of various international engagements and obligations including the Covenant of the League and the principles of International Law. As a result, the Report adopted by the Assembly at the special session of 24 February last, entirely misapprehending the spirit of Japan, pervaded as it is by no other desire than the maintenance of peace in the Orient, contains gross errors both in the ascertainment of facts and in the conclusions deduced. In asserting that the action of the Japanese Army at the time of the Incident of 18 September and subsequently did not fall within the just limits of self-defence, the Report assigned no reasons and came to an arbitrary conclusion, and in ignoring alike the state of tension which preceded, and the various aggravations which succeeded, the Incident—for all of which the full responsibility is incumbent upon China—the Report creates a source of fresh conflict in the political arena of the Orient. By refusing to acknowledge the actual circumstances

Digitized by Google

that led to the foundation of Manchoukuo, and by attempting to challenge the position taken up by Japan in recognizing the new State, it cuts away the ground for the stabilization of the Far Eastern situation. Nor can the terms laid down in its recommendations—as was fully explained in the Statement issued by this Government on 25 February last—ever be of any possible service in securing enduring peace in these regions.

The conclusion must be that in seeking a solution of the question the majority of the League have attached greater importance to upholding inapplicable formulae than to the real task of assuring peace, and higher value to the vindication of academic thesis than to the eradication of the sources of future conflict. For these reasons, and because of the profound differences of opinion existing between Japan and the majority of the League in their interpretation of the Covenant and of other treaties, the Japanese Government have been led to realize the existence of an irreconcilable divergence of views, dividing Japan and the League on policies of peace, and especially as regards the fundamental principles to be followed in the establishment of a durable peace in the Far East. The Japanese Government, believing that in these circumstances there remains no room for further co-operation, hereby give notice, in accordance with the provisions of Article 1, Paragraph 3, of the Covenant, of intention of Japan to withdraw from the League of Nations.

STATEMENT OF THE JAPANESE GOVERNMENT IN VIRTUE OF PARAGRAPH 5 OF ARTICLE 15 OF THE COVENANT OF THE LEAGUE

February 25, 1933

PART I

Japan's co-operation with the League of Nations

Japan has taken the greatest interest in the development and success of the League from the days of its inception. Her successive governments have extended to it for nearly fourteen years their hearty co-operation, and her statesmen have devoted their best efforts to the extention of its influence and the enhancement of its prestige. Japan takes pride in recalling the active participation of her representatives in the work of the League. As an original and permanent Member of the Council, she has had many opportunities of co-operation in its beneficient activities, and of these opportunities she has fully availed herself. She regards the League as a most powerful instrument for the good of humanity; and she is only anxious, in the interest of this great experiment in the establishment of universal peace, that the Members of the League shall fully appreciate the situation in the Far East and deal with it in a practical way rather than by formulae and principles.

The present dispute was first brought by China to the consideration of the Council of the League of Nations under Article 11 of the Covenant in September, 1931. In spite of the fact that Japan in this case was obliged to act solely in self-defence against aggression on the part of China, Japan, from the very beginning, has spared no effort in explaining to the League the facts and background of this unfortunate incident, and at the same time, she has constantly, and without waiting for the Resolution passed by the Council on September 30, endeavoured as far as possible not to aggravate the situation. Japan has also from time to time communicated to the League all information relative to the development of the situation, so that the League might be enabled to understand the actual conditions prevailing in the Far East.

Unfortunately, however, the condition of Manchuria showed no immediate improvement in the matter of peace and order, owing to the continued activities

Digitized by Google

of Chang Hsueh-liang, while the feelings of the Chinese and the Japanese peoples became further strained, with the result that there was no possibility of withdrawing the Japanese troops within the Railway Zone under the then existing circumstances. When the Council met again in October, Japan realized the importance of allaying the excited national feelings of the two peoples as the first essential condition of securing the safety of the lives and property of Japanese subjects and of making possible the withdrawal of the Japanese troops. She was convinced that for this purpose, it was necessary for the two parties concerned to pave the way for direct negotiations, with the object of restoring normal relations between the two countries. Japan took pains to explain this view to the President and certain Members of the Council, but proposal to initiate direct negotiations was not accepted.

Moreover, the Council formed a plan to invite a representative of the United States, a non-Member State of the League, to participate in its deliberations as an observer. To this proposition Japan raised an objection, contending that participation in the proceedings of the Council by a state not a Member of the League is contrary to its constitution, but the other Members of the Council insisted on regarding the step as a mere matter of procedure, and they invited a United States observer to the Council. Japan remained convinced that this was a matter which concerned the constitution of the League and that the action of the majority constituted a clear case of the violation of the Covenant. It became apparent that if the opinion of her fellow-members was that such an important matter of substance could be decided by a majority as a mere matter of procedure, she had ratified the Covenant under an error. However, owing to her strong desire to uphold the cause of the League, she continued to participate in the activities of the Council.

The discrepancy between the views of the other Members of the League and those entertained by Japan arose from a lack of understanding of the Far Eastern situation on the part of the League. In her desire to assist the League and to maintain its legitimate influence and usefulness, Japan proposed at the Council meeting held in November, 1931, that the League should dispatch a Commission of Enquiry to China so that its Members might be able to understand fully the actual conditions prevailing in that country. This proposal was adopted by the Council in its Resolution of December 10.

The Commission of Enquiry headed by Lord Lytton reached China in March, 1932, by way of Japan and entered Manchoukuo in April. Japan rendered every facility to the Commission in order to assist its investigations. Through the establishment of the new State of Manchoukuo, especial difficulty was encountered in the matter of the entrance of the Chinese Assessor into the territory of that State. Japan therefore exerted her good offices with Manchoukuo in order to smooth over this difficulty, and enabled the Commission to carry out its investigations.

The Report of the Commission of Enquiry was made public on October 1, 1932. On account of the brief period allowed for the investigation of the Commission, much remained to be desired for the Report to claim to present a true picture of the actual condition of China. Accordingly, Japan, on November 18 last, handed to the League her Observations on the Lytton Report in order to provide it with accurate materials for coming to a fair conclusion on the questions involved.

The Lytton Report was the subject of deliberation by the Council from November 21, and by the Assemly from December 6, 1932. The Committee of Nineteen appointed by the Assembly without the concurrence of Japan drafted on December 15 a Resolution and a Statement of Reasons concerning the procedure to be followed in performing the duty of conciliation which devolved upon that body in accordance with Paragraph 3, Article 15 of the Covenant. Japan proposed the deletion from the Draft Resolution of passages regarding the participation of states which were not members of the League, and also the modification of certain points relating to the proposed Committee of Conciliation as well as the entire deletion of the last paragraph of the Statement

Digitized by Google

of Reasons, which declared in particular that the maintenance and recognition of the present régime in Manchuria could not be considered as solution.

At the same time, considering that Paragraph 3 of Article 15 represents the final resort provided for in the Covenant for conciliatory solution of a dispute, Japan endeavoured to discover some compromise which would enable her to continue her co-operation with the League.

As stated in Part II, M of the Report, the President of the Committee and the Secretary General were authorized to enter into conversations with both the Japanese and Chinese Delegations. The conversations between the Japanese Delegation and the Secretary General were carried on from the first part of January, 1933. As a result of these conversations, a draft was drawn up, and it was referred with the knowledge of the President of the Committee to the Japanese Government for their approval. Subsequently, when amendments of the Japanese Government to this draft were communicated to the Committee of Nineteen, it was made known to the Japanese Delegation that the said draft could not be taken up as a basis of further negotiation. This caused a great surprise to the Japanese Government as they had every reason to believe that the President of the Committee, who together with the Secretary General was authorized to conduct negotiations with the both Delegations, was also fully aware of the conversations and raised no objection to the preparation of the draft.

Though the Committee finally agreed to the deletion from the Draft Resolution of passages relating to the participation of non-Member States in the work of the proposed Committee of Conciliation, it proposed that the Japanese Government accept the rest of the text of the Resolusion and the Statement of Reasons of December 15 and make a reservation in regard to the last Paragraph of the Statement of Reasons to which Japan had taken objection. The declaration contained in this Paragraph would, as is stated elsewhere in the present statement, not only constitute an action ultra vires on the part of the League but prejudice the whole question and imply a direct attack on the policy followed by the Japanese Government with respect to the existence of Manchoukuo. Furthermore, such an attitude on the part of the League was in no way in accord with the idea of conciliation advocated by the Committee of Nineteen as well as by the Japanese Government. For these reasons, Japan found it impossible to accept the proposal of the Committee.

Upon the refusal of the Japanese Delegation to agree to the Committee's proposal in this regard, the latter set to the procedure of drafting a Report under Paragraph 4 of Article 15.

However, the Japanese Government refused to give up the hope for conciliation, and in their final efforts to achieve this end, they agreed to withdraw the various amendments which they had presented when the text of December 15 was communicated to them and consented to accept as the basis of conciliation the principles and conclusions of Chapter 9 of the Lytton Report, in so far as they were applied in a way to "harmonize with the events which have taken place", which phrase is an almost literal quotation from that Report itself. Further they agreed to the maintenance of the last Paragraph of the President's Declaration (formerly called the Statement of Reasons) on the condition that its wording be modified in such a way that it would not appear to constitute a prejudgment and an attack directed against the policy of the Japanese Government vis-à-vis Manchoukuo.

The Committee of Nineteen found this final proposal likewise unacceptable. Thus the Committee rejected all the Japanese proposals and came to the conclusion that conciliation under Paragraph 3 was impossible. The Committee forthwith proceeded with the drafting of a Report under Paragraph 4 of Article 15 of the Covenant. The Draft Report thus prepared was submitted to the Assembly on February 21, and in spite of the negative vote on the part of Japan, it was adopted by the Assembly on February 24.

PART II

Errors in the Report concerning the chief characteristics of the dispute

Digitized by Google

The Report sets forth in Part III what are termed the "chief characteristics of the dispute". It is most regrettable that this part of the Report is substantially based upon the Report of the Commission of Enquiry. As stated in that Report, "the issues involved in this conflict are not as simple as they are often represented to be. They are, on the contrary, exceedingly complicated and only an intimate knowledge of all the facts as well as of their historical background should entitle anyone to express a definite opinion upon them". It must be remembered that the Commission of Enquiry spent only six weeks in Manchuria and fifteen in China, most of which was passed in Peiping, and their trip covered only a very limited area of China—a few open ports where the real condition of China could not have thoroughly been studied. In these circumstances, it was impossible for them to acquire "an intimate knowledge of all the facts as well as their historical background".

Hence the document is not as complete as it should be. It is quite natural that there should be not a few errors in the Report of the Assembly which was drafted upon the basis of the Lytton Report. These errors might have been avoided if the Committee of Nineteen had taken into due consideration the Observations of the Japanese Government presented to the Council on November 18, 1932. At any rate, it must be said that the Lytton Report, admirable and praiseworthy as it is, is not a document which one can look upon as containing all the facts as well as all the historical background upon which alone final judgment should be based. The errors in the Report of the Assembly are numerous. Let only the most salient be cited :-

(1) The Report appears to cling in Part III to the fiction that China exists today as a single organized state to be dealt with on the same footing as any country in Europe or America. The fiction happens to be merely a convenient formula which embodies in a concise form the generous aspirations of the Powers for the recovery of China as a unified and orderly state. Japan has worked hard to act upon that formula during these many years, and she is prepared to continue on the same lines in cases where ordinary matters alone are concerned. But where her vital necessities come into play as in Manchuria, she is forced to reconsider that fiction, and to ask herself what are the actual facts, and who are the actual rulers. States which are Members of the League of Nations and have little interest in China can afford to preserve the convenient fiction intact without serious difficulty. But Japan, in a totally different position, economically and strategically, is compelled, however reluctantly, to examine and set a limit to the fiction and to direct her course according to realities.

It is the view of the Japanese Government that the erstwhile Chinese State ceased to rule in Manchuria when "the fall of the United Republic after the death of Yuan Shi-kai in 1915 signalized the break-up of all unity of government in China". (Observations of the Japanese Government, page 15).

As a matter of fact, none of the governments including the Nanking Government maintains authority over China save over the limited areas which it actually controls. That is why the Japanese Government in their Observations insist that Manchuria is not naturally and necessarily an integral part of China. It will then be asked, as it has been asked,—"why did Japan invoke the Nanking Government at the outset of the Manchurian Incident? Why did Japan negotiate with Peking in 1915? Why did she declare Manchuria to be a part of China in 1922?" The answer is that Japan clung until the last moment to the fiction of Manchuria being an integral part of China. She had many excellent opportunities of departing from it, if she had wished, afforded by the chaotic state of the country. She steadily refrained from availing herself of the opportunities. But when chaos came to threaten her whole position in Manchuria, it became necessary for her to take measures to protect her various interests and important rights.

It should be observed at this point that Japan is not setting a precedent for defying the existence of a neighbour state merely because it is weak or disturbed by internal disruption.

Digitized by Google

It is needless to say that so long as the government of a state which has actually ruled the whole area maintains its authority in any part of its territory, so long does the state continue to subsist and to remain inviolable. The peculiar circumstances of China do not reside in the fact that its common government is weak or distracted by disruption. They reside in the unique fact that no authority which now exists has ever been a common government of China at all, and none therefore has title to rule the entire country.

The League of Nations should not forget that fact overrides form, and that a state must possess a single and continuous government.

(2) The Report, in agreeing that the Chinese boycott against Japan imposed after the September 18 Incident falls within the province of retaliatory measures, sows the seeds of incalculable future trouble for each and every Power interested in China. All the major Powers conduct military operations in China under certain circumstances, and maintain armed forces in Chinese territory for that specific purpose. If the adoption by the Powers of any forcible measure for the protection of their rights and interests is on each occasion to be the subject of a retaliatory boycott, the application of force will of necessity be extended without limit.

By their acceptance of the Resolutions of September 30 and of December 10, 1931, China and Japan agreed that they should take the necessary measures to prevent any aggravation of the situation. The Japanese Government desire to call the attention of the League to the fact that it was the conspicuous failure on the part of China to take such proper measures that led to the regrettable Shanghai Incident. It should also be added that in any discussion of the boycott the fact of anti-foreign education in schools and the "revolutionary foreign policy" (admitted by the Nanking Government) should not be left out of consideration, as these three subjects are inseparably bound together.

(3) The Report quotes and adopts from the Lytton Report the reference to the possibility of an arbitral settlement of the Sino-Japanese dispute. But arbitration presupposes a normal organized state with a government supreme throughout its territory and capable of enforcing an award. China, as has been stated above, has not for years been in such a state, at any rate so far as to render it possible to arbitrate with her in vital matters concerning Manchuria. With whom would the arbitration have proceeded? With Chang Hsueh-liang whom the League does not recognize? Or with the Nanking Government whose authority (as the Report of the Commission of Enquiry showed) he did not obey? Japan, with her vital interests at stake, could not and cannot possibly resort to arbitration in such a matter with such a country as China.

(4) The Report again quotes and adopts the refusal of the Commission of Enquiry to recognize as measures of self-defence the military operations of the Japanese army on the night of September 18, although it does not exclude the possibility that the Japanese officers on the spot might have thought they were acting in self-defence. This is simply another case of a facile and uncritical acceptance of the opinions of the Commission of Enquiry, utterly ignoring the emphatic contradiction contained in the Observations of the Japanese Government. On what grounds can the League or any other third party pronounce a verdict on the case contrary to the judgment of the Japanese officers on the spot? The right of self-defence is one of those inalienable rights of a state which may be duly exercised in certain specific circumstances, and the question of on what occasion and to what extent that right should be exercised is a matter which can be determined only by the state concerned. In this connection the Japanese Government in their Observations have referred to the reservations made by both France and the United States in concluding the Pact of Paris; a reference which the Assembly found it possible to pass over in silence.

The Report in stating that the operations of the Japanese army, viewed as a whole as they developed through the entire period of the conflict, cannot be regarded as an act of self-defence, fails to take into cognizance the tension which existed, the overwhelming forces

Digitized by Google

by which the Japanese were faced and the utter uncertainty which prevailed as to the probable action of those forces. Above all, it fails to take into account the vital rights and interests of Japan in Manchuria, which are not confined to the leased territory and the railways, but involve mining and forestry, consular police and consular jurisdiction, residence and trade throughout the entire region. When these rights and interests are threatened, the measures for their protection may have to be extended throughout Manchuria. But never have Japanese military operations exceeded the bounds of necessity for self-protection.

In order that it may not be supposed over sub silentio, the Japanese Government take this opportunity of explicitly denying the specific conclusion reached in the Report that no question can arise of Chinese responsibility for the development of events since September 18, 1931, and that the use of boycotts by China subsequent to that date falls under the category of reprisals. Even if the theory that the Japanese military action did not constitute lawful self-defence should be accepted, that clearly would not invest the Chinese with an unlimited license to behave as they chose to, and to enter upon a career of unrestricted violence and wrong. Much more is this the case if, as Japan contends, the actions of her troops were urgently called for by the necessities of self-defence. How can reprisals possibly be exercised against a lawful act? The proper reply to acts of self-defence is negotiation and explanation and not reprisals, which generally lead to war. Had the United States exercised reprisals in the Carolina case, war with England must have ensued. Again it must be noted that the Resolution of September 30 precludes either party from aggravating the situation; and it would seem strange to hold that this meant that China might take steps which would certainly aggravate it, leaving Japan alone responsible for any untoward development.

What appears to be a most curious statement is found in Part III of the Report which reads: "adoption of measures of self-defence does not exempt a state from complying with the provisions of Article 12 of the Covenant".

As has already been observed by the Japanese Government, the right of self-defence is exercised upon the occasion "of an urgent"—to quote Webster's definition—"and overwhelming necessity allowing no choice of means and no instant for deliberation". To enquire the observance upon such an occasion of Article 12 of the Covenant, which stipulates that the right of self-defence may be exercised three months after the award by the arbitrators or the judicial decision or the Report of the Council of the League has been made public, is to deny the right of self-defence itself.

(5) The Report says that the declaration of independence by Manchoukuo was not spontaneous. Since the statement is based upon no fresh investigation conducted at a later date, it may be readily gathered that the Report has here again adopted the erroneous conclusions of the Commission of Enquiry contained in Chapter VI of the latter's Report, the baselessness of which has been fully exposed in the Observations of the Japanese Government.

It must strike an impartial observer as extraordinary that the Assembly repeats this finding of the Commission of Enquiry in face of the emphatic denials of Japan. There are two factors which may partly account for this. First, the movement during the tyrannous régime of the Changs for the keeping of Manchuria aloof from all participation in the affairs of China Proper was subterranean, and had no repercussion in the outside world; and the authors of the Report may therefore have been sceptical of its existence. Secondly, they appear to be misled by giving implicit credence to the legend of the so-called "continental policy" of Japan, and her supposed plan to seek a political solution of the Manchurian issue as a step towards the execution of that policy. It is unnecessary to repeat that the Japanese "continental policy" is a mere Chinese fabrication, and that Japan harbours no territorial designs in any part of the world. But all this, though it may explain the rejection by the Assembly of the uncompromising denial made by Japan, can hardly be thought to excuse it.

Digitized by Google

The simple fact is that, as has so often been explained, on the disappearance of all the administrative organisations, such as they were, which had existed under the Changs, spontaneous local organisations naturally sprung up, and the Japanese troops which were responsible for the maintenance of order necessarily co-operated with them. It was a proper and necessary step, and in the circumstances an unavoidable one. Such was the whole significance of the presence of Japanese troops, and such was the sole aim of the activities of Japanese civil and military officers. Unfortunately the Commission of Enquiry, and consequently the Assembly, in their implicit reliance on the assumption that there had never existed any independence movement in Manchuria, have been obliged to attribute to the activities of Japanese civil and military officers the independence which was actually proclaimed,—and to do so upon no solid grounds whatever.

As to the assertion that the people of Manchuria are hostile to the new state, again there is no valid evidence beyond fifteen hundred letters of dubious origin received by the Commission of Enquiry. The Japanese Government desire to point out the fact that within less than a year since its foundation, Manchoukuo has achieved a marked and healthy progress in the restoration of law and order, and that no criticism or complaint has been heard of regarding its conduct of affairs, whether domestic or foreign.

Regardless of the attitude of the Assembly to the new State of Manchoukuo, she has gone forward steadily on the road of progress. Freed from the yoke of misgovernment under the tyrannous rule of the Changs, thirty million inhabitants of Manchuria, Machus, Mongols and Chinese all alike, have, already begun to reap the benefits of their labours which were denied them in former days. Throughout most of the country banditry has been suppressed. Those hostile elements, largely composed of the remnants of Chang Hsueh-liang's troops and receiving not inconsiderable assistance from their former war lord, had constituted an obstacle to the establishment of peace throughout the territory. Thanks, however, to the combined efforts of the Japanese and Manchoukuo forces, they have been practically cleared out of the Provinces of Fengtien, Kirin, and Heilungkiang, and the security of life and property has been reestablished in these Provinces. It is only in the Province of Jehol that the organized opposition still continues.

In the domain of finance, something entirely unknown in the history of China has been realized in Manchoukuo. Though the State is still in its infancy, a sound budgetary system has been initiated, and is being carried out with utmost satisfaction. The establishment of the central bank, which is functioning on the same lines as those of the advanced countries of the world, has contributed much to the stabilization of state finances and to the economic and industrial development of the country. A similar progress has also been noted in the domain of railway administration, commerce and industry, and with abundant resources with which she is endowed, there is every prospect of this country achieving, in days to come, a still greater progress along these lines to the benefit of her inhabitants and foreigners.

All this could not have been the case had the population of the country been hostile or even sullenly submissive. It is to be regretted therefore that the Assembly should have, without referring to the Observations submitted by Japan, accepted the assumption of the Commission of Enquiry, which, here again, has no foundation in fact.

(6) The Report dwells upon the need of international co-operation in the reconstruction of China, and mentions the provision of technical assistance as one form of that international co-operation. Obviously, the reconstruction of China cannot be accomplished by any such superficial and inadequate means. It could only be rendered possible by some forceful international intervention of such a nature as would at once prove incompatible with the stipulations of the Nine Power Treaty regarding the administrative integrity and political independence of China. That is another proof that it is necessary to allow ample elasticity by taking due account of changing conditions in the application of the Nine Power Treaty and the

Digitized by Google

Covenant of the League as far as China is concerned.

PART III

Impracticabilities of the Recommendations.

(1) Japan recognizes that the Covenant of the League of Nations and the Pact of Paris constitute the basic principles of the settlement of international disputes in so far as international relations in general are concerned. But a certain degree of elasticity must be allowed in the application of these principles to such special and entirely abnormal conditions as prevail in China.

(2) As to the proposal for the withdrawal of troops contained in Section 2, (1), (A) of Part IV of the Report, it is to be noted that the presence of Japanese troops outside the Railway Zone, so far from being incompatible with legal principles, has from the very beginning been due entirely to the sheer necessities of lawful self-defence, and is in no way derogatory to the accepted principles regarding the settlement of international disputes. It is further to be noted that these Japanese troops are now responsible, in accordance with the Japan-Manchoukuo Protocol, for the maintenance of peace and order in Manchoukuo. It is true that by the Resolutions of September 30 and of December 10, 1931, Japan undertook to withdraw her troops within the Railway Zone in so far as the safety of her subjects was assured, but the condition attaching to that undertaking, namely the assurance of safety of life and property, has never been satisfied; and the undertaking itself has now become inapplicable on account of the independence of Manchoukuo and the conclusion of the agreements embodied in the Protocol signed on September 15 last. Should the Japanese troops be withdrawn from the Railway Zone in accordance with the recommendation contained in the Report, it would be inevitable that unrest and disturbances would ensue in the evacuated territory. Those Members of the League that have but little direct interest in the affairs of the Far East can afford to maintain that the upholding of abstract formulae is more important than the maintenance of the peace in this part of the world. But Japan, vitally concerned in the maintenance of peace and order in Manchuria, cannot tolerate that that region should again be plunged into disorder. It cannot be supposed that a gendarmerie system as proposed by the Lytton Report would remove all apprehensions on this score. There is no precedent in the history of the world in which the security of such a vast territory was secured by gendarmerie. The proposition is absurd and cannot be put into practice. If the Japanese troops were withdrawn, the country would be quickly overrun by bandits and by Chang Hsueh-liang's troops resulting in anarchy and disorder.

(3) As to Section 2, (1) of Part IV of the Report, where it is stated that the sovereignty over Manchuria belongs to China, it has to be noted that at any rate since the year 1916, Manchuria has never been subject to the authority of China, and that in the final analysis, the present difficulty has been caused by the supposition that the sovereignty of China actually extended and extends to that region. It is entirely superfluous to say that the enforcement of this fiction will never ensure the protection of Japan's rights and interests and the maintenance of peace in the Far East. Inasmuch as the Report repudiates the restoration of the old régime as leading merely to a repetition of disorder and friction, so any return to the fiction in question must equally be repudiated. Nor is it possible for Japan to admit any policy which is incompatible with the simple fact of the existence of the State of Manchoukuo and the provisions of the Japan-Manchoukuo Protocol.

(4) With regard to the ten principles set out in the Lytton Report and cited in Section I of Part IV of the Report, apart from the observations made above, the Japanese Government deem it sufficient to quote the following passages from their Observations presented to the League in November last:—

"Certain of these principles to which the Japanese Government have no fundamental objection, have already found concrete application in the Protocol signed by Japan and Manchoukuo. But, in any view of the matter, it must eri-

Digitized by Google

dently be impossible, so long as the anarchical state of things in China persists, to arrive at a satisfactory solution of the questions at issue on the basis of the first nine of these principles, especially Principles 4-9 inclusive. As is sustained in Principle 10, these nine principles cannot be practically applied 'without a strong central government in China'."

(5) In Section 2, (3) of Part IV of the Report, the Assembly contemplates the establishment of a Committee to assist in the negotiations which are to be opened between the two parties in accordance with the method specified in the Report. This, however, is directly contrary to the insistence of Japan not to allow any third party to intervene in the Manchurian problem, and Japan finds it absolutely impossible to accept such a proposal. As, moreover, the Recommendations referred to as (1), (A) and (1), (B) of Section 2, Part IV of the Report, must be dismissed as unpractical, and those made under (2) of the said Section 2 are equally inapplicable in the present state of China, there would seem to be no scope left for the activities of the proposed Committee.

(6) The Report states in effect in Section 3 of Part IV that the maintenance and recognition of the existing régime in Manchuria is no solution and that the Members of the League should, after having adopted the Report, abstain from recognizing the present régime either de jure or de facto. Further it expresses the hope that the States non-Members of the League who are signatories of the Pact of Paris and the Nine Power Treaty will associate themselves with the view set forth in the Report in this regard. The Japanese Government cannot but consider that the Assembly, in proposing in such a manner to influence or to bind, if only morally, both Member and non-Member states in the matter of recognizing or not recognizing another state, is exceeding its powers conferred upon it by Article 15 of the Covenant. In any case, in making a proposition of this nature the League of Nations whose primary duty is the preservation of peace throughout the world could not surely contribute to the maintenance of peace and security not only in Manchoukuo, but also in the Far East. Such an action on the part of the League would prove to be an obstacle to the good understanding and friendly relations between nations upon which peace depends.

PART IV

Conclusion

The Japanese Government are fully convinced that the action of the Japanese army on the night of September 18, 1931, and thereafter has never exceeded the limits appropriate to measures of self-defence, and that Manchoukuo has been founded by the spontaneous will of the people of Manchuria. Accordingly, they consider that neither the action of the Japanese army in Manchuria, nor the conclusion of the Japan-Manchoukuo Protocol is in violation of the Covenant of the League of Nations, the Nine Power Treaty, the Pact of Paris, or any other international treaty. The Japanese Government maintain that in view of the quite abnormal condition of China, where no existing authority has ever ruled the entire country, and particularly in view of the unparalleled complexity and peculiarity of the Manchurian problem, and also having regard to the anti-foreign character of the policy of the National Government, it is impossible to think of applying to the present dispute the general formulae applicable to an ordinary international question; and they maintain moreover that neither any procedure which may be adopted for such an exceptional case, nor any solution thereby attained, can ever establish a precedent for ordinary cases of international dispute. Were it possible to apply ordinary formulae, the plans adumbrated by the Assembly would themselves be ruled out of consideration as interferences with what the Assembly regards as Chinese sovereign rights.

Unfortunately, the Assembly, through the refusal of its Members to face facts, and their uncritical acceptance of the Report of the Commission of Enquiry, has only indulged in academic and inadequate principles. The Assembly stands, if it may so be said, for mere formulae; Japan for solid realities. Japan takes her stand on established principles; the Assembly on precon-

Digitized by Google

ceived hypotheses. It results from the refusal of the Assembly to go beyond the Lytton Report. As pointed out in the preceding part of the present statement, the new State of Manchoukuo has made rapid progress. Peace and order are superseding banditry. Commerce and industry have responded to the improved situation, to the benefit of foreigners and the people of Manchoukuo alike. This is a concrete proof of the truth of the Japanese contention that the recognition and encouragement of the Manchurian State is the only road to a satisfactory solution of the Manchurian question and to the maintenance of a lasting peace in the Orient.

On the other hand, it appears impossible to look for any improvement in the Chinese situation in the near future, and China is likely to remain a chronic anxiety to the rest of the world. Communism has already invaded China, and the alarming extent and success of the invasion is far too seldom realized. A communized China would constitute a problem for Europe and America beside which other questions would pale into insignificance. But a Manchuria free from Chinese connection constitutes a barrier to the communistic danger in the Far East. Its value ought surely to be apparent to every statesman. It is earnestly hoped that the League of Nations will soon be led to change its attitude, to discard reliance on academic and inapplicable doctrine and to respect and recognize the forces that are actually rendering possible the maintenance of peace in the various regions of the world. The Covenant of the League of Nations itself provides in Article 21 for the due recognition of regional understandings, and the Japan-Manchoukuo Protocol of September 15, 1932, falls incontestably within the category of understandings such as these, as the special interests of Japan in Manchuria have again and again been recognized. At the same time, Japan takes this opportunity of repeating her disclaimer of all desire for territorial gains or commercial advantages.

TRAITÉ DE RÈGLEMENT JUDICIAIRE, D'ARBITRAGE ET DE CONCILIATION ENTRE LE JAPON ET LES PAYS-BAS

Ratifié le 25, Mai

ARTICLE 1

Tous les différends de quelque nature qu'ils soient, qui pourraient se produire entre les Hautes Parties contractantes et qui n'auraient pu être réglés, dans un délai raisonnable, par les procédés diplomatiques ordinaires seront, d'un commun accord entre les Parties ou à la demande de l'une d'elles, soumis à une Commission permanente de Conciliation, constituée et fonctionnant conformément aux dispositions du présent Traité. Les différends qui de l'avis des deux Parties seraient d'ordre juridique, ne seront soumis à la Commission permanente de Conciliation que d'un commun accord entre les Parties.

ARTICLE 2

Les différends pour la solution desquels une procédure spéciale est prévue par d'autres conventions en vigueur entre les Hautes Parties contractantes, seront réglés conformément aux dispositions de ces conventions.

ARTICLE 3

Les différends d'ordre juridique, notamment ceux concernant l'interprétation des traités en vigueur entre les Hautes Parties contractantes, différends qui n'auraient pas été soumis à la Commission permanente de Conciliation ou qui, ayant été soumis à celle-ci, n'auraient pas été réglés dans les trois mois après le dressement de son rapport,

Digitized by Google

seront, à la demande de l'une des Parties adressée à l'autre, soumis d'un commun accord par voie de compromis soit à la Cour permanente de Justice internationale qui statuera dans les conditions et suivant la procédure prévues par son Statut, soit à un Tribunal arbitral qui statuera dans les conditions et suivant la procédure prévues par la Convention de la Haye du 18 octobre 1907 pour le règlement pacifique des conflits internationaux. Le compromis est établi par échange de notes entre les Gouvernements des Hautes Parties contractantes.

A défaut d'accord entre les Parties sur le choix de la juridiction dans un délai de trois mois à compter de la proposition adressée par l'une des Parties à l'autre de soumettre le différend à la Cour permanente de Justice internationale ou à un Tribunal arbitral, le différend sera soumis, selon la procédure prévue à l'alinéa précédent, à ladite Cour, qui statuera dans les conditions et suivant la procédure prévues par son Statut. Il sera également soumis à cette Cour, suivant la même procédure, si, les Hautes Parties contractantes ayant été d'accord pour soumettre le différend à un Tribunal arbitral, la consitution de celui-ci selon les dispositions de l'article suivant n'a pas eu lieu dans les cinq mois à compter de la demande visée à l'alinéa 2 dudit article.

ARTICLE 4

Si les Hautes Parties contractantes se sont mises d'accord pour soumettre le différend à un Tribunal arbitral, celui-ci sera, à défaut d'autre entente, composé de cinq membres et constitué de la maniére suivante : les Parties nommeront chacune un arbitre qui pourra être choisi parmi leurs nationaux ; le président et les deux autres arbitres seront choisis d'un commun accord parmi les ressortissants de tierces Puissances ; ces trois arbitres devront être de nationalités différentes.

Si la nomination des membres du Tribunal arbitral n'intervient pas dans un délai de trois mois à compter de la demande adressée par l'une des Parties à l'autre de constituer ensemble un Tribunal arbitral, le soin de procéder aux nominations nécessaries sera confié à une tierce Puissance choisie d'un commun accord par les Parties.

Si l'accord ne s'établit pas à ce sujet, chaque Partie désignera une Puissance différente et les nominations seront faites de concert par les Puissances ainsi choisies.

ARTICLE 5

Il sera pourvu, dans le plus bref délai, aux vacances qui viendraient à se produire dans le Tribunal arbitral par suite de décès, de démission ou de quelque autre empêchement en suivant le mode fixé à l'article 4 pour les nominations.

ARTICLE 6

L'arbitrage visé à l'article 4 sera régi par les dispositions des articles 7, 8 et 9.

ARTICLE 7

Les Hautes Parties contractantes rédigeront un compromis déterminant l'objet du différend et la procédure à suivre.

A défaut d'indications ou de précisions suffisantes dans le compromis, la procédure arbitrale sera réglée par les dispositions de la Convention de La Haye du 18 octobre 1907 pour le règlement pacifique des conflits internationaux.

ARTICLE 8

A défaut d'autre entente concernant les règles de fond à appliquer par les arbitres, le Tribunal arbitral fonde ses décisions :

1° sur les conventions générales ou spéciales en vigueur entre les deux Parties et règles de droit qui en découlent ;

2° sur la coutume internationale considérée comme l'expression d'une pratique générale acceptée comme étant le droit ;

3° sur les principes généraux de droit reconnus par les nations civilisées ;

4° sur les résultats de la doctrine et

Digitized by Google

de la jurisprudence les plus autorisées, comme moyens auxiliaires de détermination des règles de droit.

ARTICLE 9

Sauf stipulation contraire du compromis d'arbitrage, une demande de revision de la sentence arbitrale sera admise conformément aux dispositions de l'article 83, alinéas 2 et 3 de la Convention de La Haye du 18 octobre 1907 pour le règlement pacifique des conflits internationaux, dans le délai qui sera fixé par le Tribunal.

ARTICLE 10

S'il s'agit d'un différend dont l'objet, d'après la législation intérieure de l'une des Hautes Parties contractantes, relève de la compétence des tribunaux nationaux de celle-ci, le différend ne pourra être soumis à la procédure prévue par le présent Traité qu'après jugement passé en force de chose jugée et rendu dans des délais raisonnables par l'autorité judiciaire nationale compétente.

ARTICLE 11

La Commission permanente de Conciliation prévue par le présent Traité sera composée de cinq membres, qui seront désignés comme il suit, savoir : Les Hautes Parties contractantes nommeront chacune un commissaire choisi parmi leurs nationaux respectifs et désigneront d'un commun accord les trois autres commissaires parmi les ressortissants de tierces Puissances ; ces trois commissaires devront être de nationalités différentes et, parmi eux, les Hautes Parties contractantes désigneront le Président de la Commission.

Les commissaires sont nommés pour cinq ans à compter de la date de l'entrée en vigueur du présent Traité ; leur mandat est renouvelable. Ils resteront en fonctions jusqu'à leur remplacement et, dans tous les cas, jusqu'à l'achèvement de leurs travaux en cours au moment de l'expiration de leur mandat.

Il sera pourvu aussi rapidement que possible et dans un délai qui ne devra pas excéder trois mois, aux vacances qui viendraient à se produire par suite de décès, de démission ou de quelque empêchement permanent ou temporaire en suivant le mode fixé pour les nominations. Les personnes ainsi désignées ne seront nommées que pour la période non-écoulée du mandat des commissaires qu'elles remplacent.

ARTICLE 12

La Commission permanente de Conciliation sera constituée aussitot que possible après l'échange des ratifications du présent Traité.

Si la nomination des membres à désigner en commun n'intervenait pas dans les six mois aprés l'échange des ratifications du Traité ou, en cas de remplacement, dans les trois mois à compter de la vacance du siège, le Président de la Cour permanente de Justice internationale serait, à défaut d'autre entente, prié par les deux Hautes Parties contractantes conjointement ou par l'une d'elles, de procéder aux désignations nécessaires. Si le Président est empêché ou s'il est ressortissant de l'une des Parties, le Vice-Président sera prié de procéder à ces désignations. Si celui-ci est empêché ou s'il est ressortissant de l'une des Parties, le premier des autres juges selon l'ordre du tableau de la Cour qui n'est ressortissant d'aucune des Parties, sera prié de procéder à ces désignations.

ARTICLE 13

La Commission permanente de Conciliation sera saisie par voie de requête adressée au Président.

La requête, aprés avoir exposé sommairement l'objet du différend, contiendra l'invitation à la Commission de procéder à toutes mesures propres à conduire à une conciliation.

Si la requête émane d'une seule des Parties, elle sera notifiée par celle-ci sans délai à la Partie adverse.

ARTICLE 14

La Commission permanente de Conciliation aura pour tâche d'élucider les questions en litige, de recueillir à ce:

Digitized by Google

effet toutes les informations utiles par voie d'enquête ou autrement et de s'efforcer de concilir les Parties. Elle pourra, après examen de l'affaire, exposer aux Parties les termes de l'arrangement qui lui paraîtrait convenable, et, s'il y a lieu, leur impartir un délai pour se prononcer.

A la fin de ses travaux, la Commission dressera un rapport qui en constatera le résultat et dont un exemplaire sera remis à chacune des Parties. Le rapport ne mentionnera pas si les décisions de la Commission ont été prises à l'unanimité ou à la majorité.

Les Hautes Parties contractantes ne seront jamais liées par les considérations de fait, de droit ou autres auxquelles la Commission se sera arrêtée.

Les travaux de la Commission devront être ouverts au plus tard dans les deux mois à compter de jour où elle aura été saisie du différend. A moins que les Parties n'en conviennent différemment ou que la Commission ne juge indispensable de prolonger le délai, les travaux doivent être terminés dans un délai de six mois à compter du jour où la Commission en aura déclaré l'ouverture. Si la Commission juge indispensable de continuer ses travaux au delà du délai de six mois, elle communiquera les motifs aux deux Parties.

ARTICLE 15

A moins de stipulations spéciales contraires, la Commission permanente de Conciliation réglera elle-même sa procédure qui, dans tous les cas, devra être contradictoire. En matière d'enquêtes, la Commission, si elle n'en décide autrement à l'unanimité, se conformera aux dispositions du Titre III (Commission internationale d'enquête) de la Convention de La Haye du 18 octobre 1907 pour le règlement pacifique des conflits internationaux.

ARTICLE 16

Le Président convoquera la Commission permanente de Conciliation aussitot que possible après que celle-ci aura été saisie du différend.

La Commission se réunira, sauf accord contraire entre les Parties, au lieu désigné et à la date fixée par son Président.

ARTICLE 17

Les travaux de la Commission permanente de Conciliation ne sont publics qu'en vertu d'une décision prise par la Commission avec l'assentiment des Parties.

Les Hautes Parties contractantes s'engagent à ne pas publier le résultat des travaux de la Commission sans s'être préalablement consultées.

ARTICLE 18

Les Hautes Parties contractantes seront représentées auprès de la Commission permanente de Conciliation par des agents ayant mission de servir d'intermédiaires entre elles et la Commission ; elles pourront, en outre, se faire assister par des conseils et experts nommés par elles à cet effet et demander l'audition de toutes personnes dont le témoignage leur paraîtrait utile.

La Commission rura, de son coté, la faculté de demander des explications orales aux agents, conseils et experts des deux Parties, ainsi qu'à toutes personnes qu'elle jugerait utile de faire comparaître avec l'assentiment de leur Gouvernement.

ARTICLE 19

Sauf dispositions contaires du présent Traité, les décisions de la Commission permanente de Conciliation seront prises à la majorité des voix.

La Commission ne pourra prendre de décision portant sur le fond du différend que si tous les membres ont été dûment convoqués et si au moins tous les membres élus en commun sont présents.

ARTICLE 20

Les Hautes Parties contractantes s'engagent à faciliter les travaux de la Commission permanente de Conciliation et, en particulier, à assurer à celle-ci l'assistance de leurs autorités compétentes, à lui fournir dans la plus large mesure possible tous documents et in-

Digitized by Google

formations utiles et à prendre les mesures nécessaires pour permettre à la Commission de procéder sur leur territoire à la citation et à l'audition de témoins ou d'experts et à des transports sur les lieux.

ARTICLE 21

Pendant la durée des travaux de la Commission permanente de Conciliation, chacun des commissaires recevra une indemnité dont le montant sera arrêté d'un commun accord entre les Hautes Parties contractantes qui en supporteront chacune une part égale. Les frais généraux occasionnés par le fonctionnement de la Commission seront répartis par moitié.

ARTICLE 22

Les décisions du Tribunal arbitral ou de la Cour permanente de Justice internationale devront être exécutées de bonne foi par les Parties.

Les Hautes Parties contractantes s'engagent à ne prendre pendant la durée de la procédure de la Commission permanente de Conciliation, du Tribunal arbitral ou de la Cour permanente de Justice internationale, aucune mesure qui pourrait avoir une répercussion défavorable sur l'acceptation de la proposition de la Commission permanente de Conciliation ou sur l'exécution de la décision du Tribunal arbitral ou de la Cour permanente de Justice internationale. Le Tribunal arbitral peut, à la remande de l'une des Parties, ordonner des mesures provisoires, pour autant que ces mesures peuvent être prises par les Parties par la voie administrative. La Commission permanente de Conciliation peut également faire des propositions dans le même but. Pour ce qui concerne la Cour permanente de Justice internationale, son Statut est applicable.

ARTICLE 23

Si quelque différend venait à surgir entre les Hautes Parties contractantes relativement à l'interprétation du présent Traité, ce différend serait réglé selon la procédure prévue à l'article 3.

ARTICLE 24

Le présent Traité sera ratifié. Les ratifications en seront échangées à La Haye aussitot que faire se pourra.

ARTICLE 25

Le présent Traité entrera en vigueur dès l'échange des ratifications et aura une durée de cinq ans à compter de son entrée en vigueur. S'il n'est pas dénoncé six mois avant l'expiration de cette période, il sera considéré comme renouvelé tacitement pour une nouvelle période de cinq ans et ainsi de suite.

Si, lors de l'expiration de la durée du présent Traité, une procédure quelconque en vertu de ce Traité se trouvait pendante devant la Commission permanente de Conciliation, devant la Cour permanente de Justice internationale ou devant le Tribunal arbitral, cette procédure serait poursuivie jusqu'à son achèvement.

PROTOCOLE DE SIGNATURE

Au moment de procéder à la signature du Traité de règlement judiciaire, d'arbitrage et de conciliation entre le Japon et les Pays-Bas les Plénipotentiaires soussignés se sont déclarés d'accord sur ce qui suit :

1. Le Traité susmentionné sera applicable à tous les différends qui viendraient à s'élever entre les deux pays et qui ne toucheraient pas directement aux intérêts de tierces Puissances.

2. Au cas où, par suite de la réalisation du retrait du Japon de la Société des Nations, dont préavis a été donné le 27 mars 1933, un changement viendrait à se produire dans la situation juridique du Japon vis-à-vis de la Cour permanente de Justice internationale, les Hautes Parties contractantes entreront en pourparlers, à la demande du Gouvernement japonais, pour examiner s'il y a lieu de modifier des dispositions dudit Traité qui ont trait à ladite Cour. Pendant ces pourparlers l'application desdites dispositions sera suspendue. Les procédures pendantes devant la

Digitized by Google

Cour au moment où le Gouvernement du Japon aurait fait la demande visée ci-dessus, seraient toutefois poursuivies jusqu'à leur achèvement et les dispositions du Traité resteraient applicables aux décisions de la Cour dans ces cas.

La Haye, le dix-neuvième jour du quatrième mois de la huitième année de Showa, correspondant au 19 avril 1933.

Hiroshi Saito.

Beelaerts van Blokland.

TREATY OF COMMERCE AND NAVIGATION BETWEEN JAPAN AND CHINA

Signed at Peking, July 21, 1896.

ARTICLE I

There shall be perpetual peace and friendship between His Majesty the Emperor of Japan and His Majesty the Emperor of China, and between their respective subjects who shall enjoy equally in the respective countries of the High Contracting Parties full and entire protection for their persons and property.

ARTICLE II

It is agreed by the High Contracting Parties that His Majesty the Emperor of Japan may, if He see fit, accredit a Diplomatic Agent to the Court of Peking and His Majesty the Emperor of China may, if He see fit, accredit a Diplomatic Agent to the Court of Tokio.

The Diplomatic Agent thus accredited shall respectively enjoy all the prerogatives, privileges and immunities accorded by international law to such Agents and they shall also in all respects be entitled to the treatment extended to similar Agents of the most favoured nation.

Their persons, families, suites, establishments, residences and correspondence shall be held inviolable. They shall be at liberty to select and appoint their own officers, courtiers, interpreters, servants and attendants without any kind of molestation.

ARTICLE III

His Majesty the Emperor of Japan may appoint Consuls-General, Consuls, Vice-Consuls and Consular Agents to reside at such of the ports, cities and towns of China, which are now, or may hereafter be, opened to foreign residence and trade, as the interests of the Empire of Japan may require.

These officers shall be treated with due respect by the Chinese Authorities, and they shall enjoy all the attributes, authority, jurisdiction, privileges and immunities which are, or may hereafter be, extended to smilar officers of the nation most favoured in these respects.

His Majesty the Emperor of China may likewise appoint Consuls-General, Consuls, Vice-Consuls and Consular Agents to reside at any or all of those places in Japan, where Consular officers of other nations are now, or may hereafter be, admitted, and, saving in the matter of jurisdiction in respect of Chinese subjects and property in Japan, which is reserved to the Japanese Judicial Courts, they shall enjoy the rights and privileges that are usually accorded to such officers.

ARTICLE IV

Japanese subjects may, with their families, employés and servants, frequent, reside and carry on trade, industries and manufactures, or pursue any other lawful avocations in all the ports, cities and towns of China, which are now, or may hereafter be, opened to foreign residence and trade. They are at liberty to proceed to or from any of the open ports with their merchandise and effects, and within the localities at those places which have already been,

Digitized by Google

or may hereafter be, set apart for the use and occupation of foreigners, they are allowed to rent or purchase houses, rent or lease land, and to build churches, cemeteries and hospitals, enjoying in all respects the same privileges and immunities as are now, or may hereafter be, granted to the subjects or citizens of the most favoured nation.

ARTICLE V

Japanese vessels may touch for the purpose of landing and shipping passengers and merchandise in accordance with the existing Rules and Regulations concerning foreign trade there at all those places in China, which are now ports of call, namely, Nganching, Tatung, Hu-kow, Wu-sueh, Lu-chi-kow and Woosung and such other places as may hereafter be made ports of call also. If any vessel should unlawfully enter ports other than open ports and ports of call in China or carry on clandestine trade along the coast or rivers, the vessel with her cargo shall be subject to confiscation by the Chinese Government.

ARTICLE VI

Japanese subjects may travel, for their pleasure or for purposes of trade, to all parts of the interior of China, under passports issued by Japanese Consuls and countersigned by the Local Authorities. These passports, if demanded, must be produced for examination in the localities passed through. If the passports be not irregular, the bearers will be allowed to proceed and no opposition shall be offered to their hiring of persons, animals, carts or vessels for their own conveyance or for the carriage of their personal effects or merchandise. If they be without passports or if they commit any offence against the law, they shall be handed over to the nearest Consul for punishment, but they shall only be subject to necessary restraint and in no case to ill-usage. Such passports shall remain in force for a period of thirteen Chinese months from the date of issue. Any Japanese subject travelling in the interior without a passport shall be liable to a fine not exceeding three hundred Taels. Japanese subjects may, however, without passports go on excursions from any of the ports open to trade, to a distance not exceeding one hundred Chinese li and for a period not exceeding five days. The provisions of this Article do not apply to crews of ships.

ARTICLE VII

Japanese subjects residing in the open ports of China may take into their service Chinese subjects and employ them in any lawful capacity without restraint or hindrance from the Chinese Government or Authorities.

ARTICLE VIII

Japanese subjects may hire whatever boats they please for the conveyance of cargo or passengers and the sum to be paid for such boats shall be settled between the parties themselves, without the interference of the Chinese Government or officers. No limit shall be put upon the number of boats, neither shall a monopoly in respect either of the boats or of the porters or coolies engaged in carrying goods be granted to any parties. If any smuggling takes place in them the offenders will of course be punished according to law.

ARTICLE IX

The Tariffs and Tariff Rules now in force between China and the Western Powers shall be applicable to all articles upon importation into China by Japanese subjects or from Japan, or upon exportation from China by Japanese subjects or to Japan. It is clearly understood that all articles, the importation or exportation of which is not expressly limited or prohibited by the Tariffs and Tariff Rules existing between China and the Western Powers, may be freely imported into and exported from China, subject only to the payment of the stipulated import or export duties. But in no case shall Japanese subjects be called upon to pay in China other or higher import or export duties than are, or may be, paid by the subjects or citizens of the most favoured nation; nor shall any article imported into China from Japan or exported from China to Japan be charged upon such importation or

Digitized by Google

exportation other or higher duties than are now, or may hereafter be, imposed in China on the like article when imported from or exported to the nation most favoured in those respects.

ARTICLE X

All articles duly imported into China by Japanese subjects or from Japan shall, while being transported, subject to the existing Regulations, from one open port to another, be wholly exempt from all taxes, imposts, duties, lekin, charges and exactions of every nature and kind whatsoever, irrespective of the nationality of the owner or possessor of the articles, or the nationality of the conveyance or vessel in which the transportation is made.

ARTICLE XI

It shall be at the option of any Japanese subject desiring to convey duly imported articles to an inland market to clear his goods of all transit duties by payment of a commutation transit tax or duty, equal to one-half of the import duty in respect of dutiable articles, and two and half per cent. upon the value in respect of duty free articles; and on payment thereof a certificate shall be issued, which shall exempt the goods from all further inland charges whatsoever. It is understood that this Article does not apply to imported opium.

ARTICLE XII

All Chinese goods and produce purchased by Japanese subjects in China elsewhere than at an open port thereof and intended for export abroad, shall in every part of China be freed from all taxes, imposts, duties, lekin, charges and exactions of every nature and kind whatsoever, saving only export duties when exported, upon the payment of a commutation transit tax or duty calculated at the rate mentioned in the last preceding Article substituting export duty for import duty, provided such goods and produce are actually exported to a foreign country within the period of twelve months from the date of the payment of the transit tax; all Chinese goods and produce purchased by Japanese subjects at the open ports of China and of which export to foreign countries is not prohibited shall be exempt from all internal taxes, imposts, duties, lekin, charges and exactions of every nature and kind whatsoever, saving only export duties upon exportation and all articles purchased by Japanese subjects in any part of China, may also, for the purposes of export abroad, be transported from open port to open port, subject to the existing Rules and Regulations.

Merchandise of a bona fide foreign origin, in respect of which full import duty shall have been paid, may at any time within three years from the date of importation be re-exported from China by Japanese subjects to any foreign country, without the payment of any export duty; and the re-exporters shall, in addition, be entitled forthwith to receive from the Chinese Customs drawback certificates for the amount of import duty paid thereon, provided that the merchandise remains intact and unchanged in its original packages. Such drawback certificates shall be immediately redeemable in ready money by the Chinese Customs Authorities at the option of the holders thereof.

ARTICLE XIV

The Chinese Government consents to the establishment of Bonded Warehouses at the several open ports of China. Regulations on the subject shall be made hereafter.

ARTICLE XV

Japanese merchant vessels of more than one hundred and fifty tons burden entering the open ports of China, shall be charged tonnage dues at the rate of four mace per registered ton; if of one hundred and fifty tons and under, they shall be charged at the rate of one mace per registered ton. But any such vessel taking its departure within forty-eight hours after arrival, without breaking bulk, shall be exempt from the payment of tonnage dues.

Japanese vessels having paid the above specified tonnage dues shall thereafter be exempt from all tonnage dues in all the open ports and ports of call of China

Digitized by Google

for the period of four months from the date of clearance from the port where the payment of such tonnage dues is made. Japanese vessels shall not, however, be required to pay tonnage dues for the period during which they are actually undergoing repairs in China.

No tonnage dues shall be payable on small vessels and boats employed by Japanese subjects in the conveyance of passengers, baggage, letters, or duty free articles between any of the open ports of China. All small vessels and cargo boats, however, conveying merchandise which is, at the time of such conveyance, subject to duty, shall pay tonnage dues once in four months at the rate of one mace per ton.

No fee or charges other than tonnage dues shall be levied upon Japanese vessels and boats, and it is also understood that such vessels and boats shall not be required to pay other or higher tonnage dues than the vessels and boats of the most favoured nation.

ARTICLE XVI

Any Japanese merchant vessel arriving at an open port of China shall be at liberty to engage the services of a pilot to take her into port. In like manner, after she has discharged all legal dues and duties and is ready to take her departure, she shall be allowed to employ a pilot to take her out of port.

ARTICLE XVII

Japanese merchant vessels compelled on account of injury sustained or any other cause to seek a place of refuge, shall be permitted to enter any nearest port of China, without being subject to the payment of tonnage dues or duties upon goods landed in order that repairs to the vessel may be effected, provided the goods so landed remain under the supervision of the Customs Authorities. Should any such vessel be stranded or wrecked on the coast of China, the Chinese Authorities shall immediately adopt measures for rescuing the passengers and crew and for securing the vessel and cargo. The persons thus saved shall receive friendly treatment, and, if necessary, shall be furnished with means of conveyance to the nearest Consular station. Should any Chinese merchant vessel be compelled on account of injury sustained or any other cause to seek a place of refuge in the nearest port of Japan, she shall likewise be treated in the same way by the Japanese Authorities.

ARTICLE XVIII

The Chinese Authorities at the several open ports shall adopt such means as they may judge most proper to prevent the revenue suffering from fraud or smuggling.

ARTICLE XIX

If any Japanese vessel be plundered by Chinese robbers or pirates, it shall be the duty of the Chinese Authorities to use every endeavour to capture and punish the said robbers or pirates, and to recover and restore the stolen property.

ARTICLE XX

Jurisdiction over the persons and property of Japanese subjects in China is reserved exclusively to the duly authorized Japanese Authorities, who shall hear and determine all cases brought against Japanese subjects or property by Japanese subjects, or by the subjects or citizens of any other Power, without the intervention of the Chinese Authorities.

ARTICLE XXI

If the Chinese Authorities or a Chinese subject make any charge or complaint of civil nature against Japanese subjects or in respect of Japanese property in China, the case shall be heard and decided by the Japanese Authorities.

In like manner all charge and complaints of a civil nature brought by Japanese Authorities or subjects in China against Chinese subjects or in respect of Chinese property, shall be heard and determined by the Chinese Authorities.

ARTICLE XXII

Japanese subjects charged with the

Digitized by Google

commission of any crimes or offences in China shall be tried, and, if found guilty, punished by the Japanese Authorities according to the laws of Japan.

In like manner Chinese subjects charged with the commission of any crimes or offences against Japanese subjects in China, shall be tried and if found guilty, punished by the Chinese Authorities according to the laws of China.

ARTICLE XXIII

Should any Chinese subjects fail to discharge debts incurred to a Japanese subject, or should he fraudulently abscond, the Chinese Authorities will do their utmost to effect his arrest, and enforce recovery of the debts. The Japanese Authorities will likewise do their utmost to bring to justice any Japanese subject who fraudulently absconds or fails to discharge debts incurred by him to a Chinese subject.

ARTICLE XXIV

If Japanese subjects in China, who have committed offences or have failed to discharge debts and fraudulently abscond, should flee to the interior of China or take refuge in houses occupied by Chinese subjects or on board of Chinese ships, the Chinese Authorities shall at the request of the Japanese Consul, deliver them to the Japanese Authorities.

In like manner if Chinese subjects in China, who have committed offences or have failed to discharge debts and fraudulently abscond, should take refuge in houses occupied by Japanese subjects in China or on board of Japanese ships in Chinese waters, they shall be delivered up, at the request of the Chinese Authorities made to the Japanese Authorities.

ARTICLE XXV

The Japanese Government and its subjects are hereby confirmed in all privileges, immunities and advantages conferred on them by the Treaty stipulations between Japan and China, which are now in force; and it is hereby expressly stipulated that the Japanese Government and its subjects will be allowed free and equal participation in all privileges, immunities and advantages that may have been, or may be hereafter, granted by His Majesty the Emperor of China to the Government or subjects of any other nation.

ARTICLE XXVI

It is agreed that either of the High Contracting Parties may demand a revision of the tariffs and of the Commercial Articles of this Treaty at the end of ten years from the date of the exchange of the ratifications; but if no such demand be made on either side and no such revision be effected, within six months after the end of the first ten years, then the Treaty and Tariffs, in their present form, shall remain in force for ten years more, reckoned from the end of the preceding ten years, and so it shall be at the end of each successive period of ten years.

ARTICLE XXVII

The High Contracting Parties will agree upon Rules and Regulations necessary to give full effect to this Treaty. Until such Rules and Regulations are brought into actual operation, the Arrangements, Rules and Regulations subsisting between China and the Western Powers, so far as they are applicable and not inconsistent with the provisions of this Treaty, shall be binding between the Contracting Parties.

ARTICLE XXVIII

The present Treaty is signed in the Japanese, Chinese and English languages. In order, however, to prevent future discussions, the Plenipotentiaries of the High Contracting Parties have agreed upon that in case of any divergence in the interpretation between the Japanese and Chinese texts of the Treaty, the difference shall be settled by reference to the English text.

SUPPLEMENTARY TREATY OF COMMERCE AND NAVIGATOIN

Signed at Shanghai, October 8, 1903

ARTICLE I

Whereas China, with the object of reforming its fiscal system, proposes to levy a surtax in excess of the tariff rates on all goods passing through the Custom Houses, whether maritime or inland and frontier, in order to compensate in a measure for the loss incurred by the complete abolition of likin, Japan consents to pay the same surtax as is agreed upon between China and all the Treaty Powers. With regard to the production tax, consumption tax and excise, and the taxes on native opium and salt, leviable by China, Japan also consents to accept the same arrangements as are agreed upon between all the Treaty Powers and China. It is understood however that the commerce, rights and privileges of Japan shall not, on account of the above, be placed at any disadvantage as compared with the commerce, rights and privileges of other Powers.

ARTICLE II

The Chinese Government agree to permit Japanese steamship-owners to erect, at their own expense, appliances for hauling through the rapids of that part of the Yang-tze-kiang between Ichang and Chungking. But as the interests of the population of the provinces of Szechuen, Hunan and Hupeh are involved, it is therefore necessary that the approval of the Imperial Maritime Customs be obtained before such appliances may be so erected.

These appliances, which shall be at the disposal of all vessels both steamers and junks, shall not obstruct the waterway nor interfere with the free passage of junks or of persons on the banks of the river. Such appliances shall be subject to special regulations to be drawn up by the Imperial Maritime Customs.

ARTICLE III

The Chinese Government agree that any Japanese steamer capable of navigating the inland waterways, upon reporting at the Imperial Maritime Customs, may proceed for the purpose of trade from a treaty port to places inland, so reported, on complying with the Original and Supplementary Regulations for Steam Navigation Inland.

ARTICLE IV

In case Chinese subjects conjointly with Japanese subjects organize a partnership or company for a legitimate purpose, they shall equitably share the profits and losses with all the members according to the terms of the agreement or memorandum and articles of association and the regulations framed thereunder, and they shall be liable to the fulfilment of the obligations imposed by the said agreement or memorandum and articles of association and the regulations framed thereunder as accepted by them and as interpreted by Japanese Courts. Should they fail to fulfil the obligations so imposed and legal action be taken against them in consequence, Chinese Courts shall at once enforce fulfilment of such obligations.

It is understood that in case Japanese subjects conjointly with Chinese subjects organize a partnership or company, they shall also equitably share the profits and losses with all the members according to the terms of the agreement or memorandum and articles of association and the regulations framed thereunder. Should such Japanese subjects fail to fulfil any of the obligations imposed by the said agreement or memorandum and articles of association or by the regulations framed thereunder, Japanese Courts shall in like manner at once enforce fulfilment of such obligations by them.

ARTICLE V

The Chinese Government agree to make and faithfully enforce such regulations as are necessary for preventing Chinese subjects from infringing registered trade-marks held by Japanese subjects.

Digitized by Google

The Chinese Government likewise agree to make such regulations as are necessary for affording protection to registered copyrights held by Japanese subjects in the books, pamphlets, maps and charts written in the Chinese language and specially prepared for the use of Chinese people.

It is further agreed that the Chinese Government shall establish registration offices where foreign trade-marks and copyrights, upon application for the protection of the Chinese Government, shall be registered in accordance with the provisions of the regulations to be hereafter framed by the Chinese Government for the purpose of protecting trade-marks and copy-rights.

It is understood that Chinese trade marks and copy-rights properly registered according to the provisions of the laws and regulations of Japan will receive similar protection against infringement in Japan.

This Article shall not be held to protect against due process of law any Japanese or Chinese subject who may be the author, proprietor or seller of any publication calculated to injure the well-being of China.

ARTICLE VI

China agrees to establish itself, as soon as possible, a system of uniform national coinage and provide for a uniform national currency which shall be freely used as legal tender in payment of all duties, taxes and other obligations by Japanese subjects as well as by Chinese subjects in the Chinese Empire. It is understood, however, that all Customs duties shall continue to be calculated and paid on the basis of the Haikwan tael.

ARTICLE VII

As the weights and measures used by the mercantile and other classes for general and commercial purposes in the different provinces of China vary and do not accord with the standards fixed by the Imperial Government Boards, thus resulting in detriment to the trade of Chinese and foreigners, the Governor-General and Governors of all the provinces, after careful inquiry into existing conditions, shall consult together and fix upon uniform standards which, after a Memorial to the Throne for sanction, shall be adopted and used in all transactions by officials and people throughout all the Empire. These standards shall be first used in the places opened to foreign trade and gradually extended to inland places. Any differences resulting from divergence between the new weights and measures and those now in vogue shall be equitably settled, whether, by way of increase or decrease according to the amount of such difference.

ARTICLE VIII

The Regulations for Steam Navigation Inland of the fifth moon of the twenty-fourth year of Kuang-hsü and the Supplementary Rules of the seventh moon of the same year having been found in some respects inconvenient in working, the Chinese Government hereby agree to amend them and to annex such new Rules to this Treaty.

These Rules shall remain in force until altered by mutual consent.

ARTICLE IX

The provisions of all treaties and engagements now subsisting between Japan and China, in so far as they are not modified or repealed by this Act, are hereby confirmed; and it is hereby expressly stipulated in addition that jects, Commerce, Navigation, Shipping, Industries and Property of all kinds shall be allowed free and full participation in all privileges, immunities and advantages which have been or may the Japanese Government, Officers, Subhereafter be granted by His Majesty the Emperor of China or by the Chinese Government or by the Provincial or Local Administrations of China to the Government, Officers, Subjects, Commerce, Navigation, Shipping, Industries or Property of any other nation.

The Japanese Government will do its utmost to secure to Chinese Officers and Subjects resident in Japan the most favourable treatment compatible with the laws and regulations of the Empire.

ARTICLE X

The High Contracting Parties hereto agree that, in case of and after the complete withdrawal of the foreign troops stationed in the province of

Digitized by Google

Chihli and of the Legation guards, a place of international residence and trade in Peking will be forthwith opened by China itself. The detailed regulations relating thereto shall be settled in due time after consultation.

The Chinese Government agree to open to foreign trade, within six months from the exchange of the Ratifications of this Treaty, Ch'angshafu in the province of Hunan on the same footing as the ports already opened to foreign trade. Foreigners residing in this open port are to observe the Municipal and Police Regulations on the same footing as Chinese residents, and they are not to be entitled to establish a municipality and Police of their own within the limits of this treaty port, except with the consent of the Chinese authorities.

The Chinese Government agree that, upon the exchange of the Ratifications of this Treaty, Mukden and Tatungkow, both in the province of Shengking, will be opened by China itself as places of international residence and trade. The selection of suitable localities to be set apart for international use and occupation and the regulations for these places set apart for foreign residence and trade shall be agreed upon by the Governments of Japan and China after consultation together.

ARTICLE XI

The Government of China having expressed a strong desire to reform its judicial system and to bring it into accord with that of Japan and Western nations, Japan agrees to give every assistance to such reform, and will also be prepared to relinquish its extraterritorial rights when satisfied that the state of the Chinese laws, the arrangements for their administration and other considerations warrant it in so doing.

ARTICLE XII

The present Treaty is signed in the Japanese, Chinese and English languages. In order, however, to prevent future discussions, the Plenipotentiaries of the High Contracting Parties have agreed that in case of any divergence in the interpretation between the Japanese and Chinese Texts of the Treaty, the difference shall be settled by reference to the English Text.

ANNEX 1

INLAND WATERS STEAM NAVIGATION

(ADDITIONAL RULES)

Shanghai, October, 1903.

1. Japanese steamship-owners are at liberty to lease warehouses and jetties on the banks of waterways from Chinese subjects for a term not exceeding twenty-five years, with option of renewal on terms to be mutually arranged. In cases where Japanese merchants are unable to secure warehouses and jetties from Chinese subjects on satisfactory terms, the local officials, after consultation with the Governor or Governor-General or Minister of Commerce, shall arrange to provide these on renewable lease, as above mentioned, at current equitable rates.

2. Jetties shall only be erected in such positions that they will not obstruct the inland waterway or interfere with navigation, and with the sanction of the nearest Commissioner of Customs; such sanction, however, shall not be arbitrarily withheld.

3. Japanese merchants shall pay taxes and contributions on these warehouses and jetties on the same footing as Chinese proprietors of similar properties in the neighbourhood. Japanese merchants may only employ Chinese agents and staff to reside in warehouses so leased at places touched at by steamers engaged in inland traffic to carry on their business; but Japanese merchants may visit these places from time to time to look after their affairs. The existing rights of Chinese jurisdiction over Chinese subject shall not by reason of this clause be diminished or interfered with in any way.

4. Steam vessels navigating the inland waterways of China shall be responsible for loss caused to riparian proprietors by damage which they may do to the banks or works on them, and for the loss which may be caused by such damage.

In the event of China desiring to prohibit the use of some particular shallow waterway by launches, because there is reason to fear that the use

Digitized by Google

of it by them would be likely to injure the banks and cause damage to the adjoining country, the Japanese Authorities, when appealed to, shall, if satisfied of the validity of the objection, prohibit the use of that waterway by Japanese launches, provided that Chinese launches are also prohibited from using it.

Both Foreign and Chinese launches are prohibited from crossing dams and weirs at present in existence on inland waterways where they are likely to cause injury to such works, which would be detrimental to the water service of the local people.

5. The main object of the Japanese Government in desiring to see the inland waterways of China opened to steam navigation being to afford facilities for the rapid transport of both foreign and native merchandise, they undertake to offer no impediment to the transfer to a Chinese company and the Chinese flag of any Japanese steamer which may now or hereafter be employed on the inland waters of China, should the owner be willing to make the transfer.

In the event of a Chinese company registered under Chinese law being formed to run steamers on the inland waters of China, the fact of Japanese subjects holding shares in such a company shall not entitle the steamers to fly the Japanese flag.

6. Registered steamers and their tows are forbidden, just as junks have always been forbidden, to carry contraband goods. Infraction of this rule will entail the penalties prescribed in the treaties for such an offence, and cancellation of the Inland Waters Navigation Certificate carried by the vessels, which will be prohibited from thereafter plying on inland waters.

7. As it is desirable that the people living inland should be disturbed as little as possible by the advent of steam vessels to which they are not accustomed, inland waters not hitherto frequented by steamers shall be opened as gradually as may be convenient to merchants and only as the owners of steamers may see prospect of remunerative trade.

In cases where it is intended to run steam vessels on waterways on which such vessels have not hitherto run, intimation shall be made to the Commissioner of Customs at the nearest open port, who shall report the matter to the Ministers of Commerce. The latter, in conjunction with the Governor-General or Governor of the province, after careful consideration of all the circumstances of the case, shall at once give their approval.

8. A registered steamer may ply within the waters of a port, or from one open port or ports to another open port or ports, or from one open port or ports to places inland, and thence back to such port or ports. She may, on making due report to the Customs, land or ship passengers or cargo at any recognized places of trade passed in the course of the voyage; but may not ply between inland places exclusively except with the consent of the Chinese Government.

9. Any cargo and passenger boats may be towed by steamers. The helmsman and crew of any boat towed shall be Chinese. All boats, irrespective of ownership, must be registered before they can proceed inland.

10. The above Rules are supplementary to the Regulations published in the fifth and seventh moons of the twenty-fourth year of Kuang-hsü, which remain in full force and effect in so far as they are not modified by the Rules now agreed upon.

The present Rules and the Regulations of the fifth and seventh moons of the twenty-fourth year of Kuang-hsü may hereafter be modified, as circumstances require, by mutual consent.

ANNEXES 2 AND 3

EXCHANGE OF NOTES BETWEEN THE JAPANESE AND CHINESE COMMISSIONERS FOR TREATY REVISION REGARDING THE INLAND WATERS NAVIGATION OF THE JAPANESE STEAMERS

FROM JAPANESE COMMISSIONERS TO CHINESE COMMISSIONERS

October 8, 1903

Gentlemen,

According to Article III of the present Treaty the Chinese Government agree that any Japanese steamer capable of

Digitized by Google

navigating Inland Waterways, upon reporting at the Imperial Maritime Customs, may proceed for the purpose of trade from a treaty port to places inland, so reported, on complying with the Original and Supplementary Regulations for Steam Navigation Inland.

It is understood that all classes of Japanese steamers, whatever their size, provided they are capable of navigating the Inland Waterways, may on complying with the Regulations receive an Inland Waters Certificate and carry on trade with inland places, and the Chinese Government will in no case raise difficulties and stop such steamers from plying to and from inland places.

We have the honour, in order to prevent future misunderstandings, to address this despatch to Your Excellencies and to request that instructions be sent to the Inspector General of Maritime Customs to act in accordance with this understanding. We have further the honour to request a reply from Your Excellencies.

We have the honour to be, etc.

FROM CHINESE COMMISSIONERS TO JAPANESE COMMISSIONERS

Shanghai, August 29, 1903
(Chinese Calendar)

Gentlemen,

We have the honour to acknowledge the receipt of Your Excellencies' despatch of this date, written with a view to preventing future misunderstandings, to the effect that, in accordance with the provisions of Article III of the present Treaty, all classes of Japanese steamers, whatever their size, provided they are capable of navigating the Inland Waterways, may on complying with the Regulations receive an Inland Waters Certificate and ply to and from inland places, and that the Chinese Government will in no case raise difficulties and stop them.

During the negotiations of this Article, we received a list from Your Excellencies of the Japanese steamers viz., Sanyo Maru, Setagawa Maru, Hiuga Maru, Urato Maru, Neisei Maru, Heian Maru, Taiko Maru, Yoshino Maru, Meiko Maru, Fukuju Maru, Hijikawa Maru, Nagata Maru, Kyodo Maru, Horai Maru, Kwanko Maru, Keiko Maru, Kinriu Maru, Zensho Maru and Kohei Maru, ranging from one hundred and twenty-one tons to four hundred and ten tons register—plying from Chefoo to inland places in Manchuria, under Inland Waters Certificate and in accordance with the Regulations for Steam Navigation Inland, which vessels have not been prevented from doing so on account of their class.

At that time we instructed the Deputy Inspector General of Customs to make inquiries into the records of the Custom Houses, and he reported that the circumstances were in accordance with Your Excellencies' statement.

In consequence of the receipt of Your Excellencies' despatch we shall communicate with the Wai-wu Pu and request that instructions be sent to the Inspector General of Customs to take these circumstances into consideration and to act accordingly, and we have the honour to write this despatch for purposes of record.

We have the honour to be, etc.

ANNEXES 4 AND 5

EXCHANGE OF NOTES BETWEEN THE JAPANESE AND CHINESE COMMISSIONERS FOR TREATY REVISION REGARDING THE APPOINTMENT OF AN OFFICER FOR COLLECTING DUES AND DUTIES PROVIDED IN NO. 9 OF THE SUPPLEMENTARY RULES FOR STEAM NAVIGATION INLAND

FROM JAPANESE COMMISSIONERS TO CHINESE COMMISSIONERS

October 8, 1903

Gentlemen,

The provision contained in No. 9 of the Supplementary Rules governing steam navigation on Inland Waters published in the seventh moon of the twenty-fourth year of Kuang-hsü, regarding the appointment of an officer to collect dues and duties, not having in all cases been given effect to, we hav the honour to request that Your Excellencies' Government will again issue instructions to all provinces to give strict effect to this provision, as it is a matter of importance.

We trust that Your Excellencies will

Digitized by Google

comply with the request contained in this despatch and that you will favour us with a reply.

We have the honour to be, etc.

FROM CHINESE COMMISSIONERS TO JAPANESE COMMISSIONERS

Shanghai, August 18, 1903
(Chinese Calendar)

Gentlemen,

We have the honour to acknowledge the receipt of Your Excellencies' despatch of this date to the effect that, the provision contained in No. 9 of the Supplementary Rules governing steam navigation on Inland Waters published in the seventh moon of the twenty-fourth year of Kuang-hsü, regarding the appointment of an officer to collect dues and duties, not having in all cases been given effect to, you request that instructions be again issued to all provinces to give strict effect to this provision, as it is a matter of importance.

We have noted the above and have communicated with proper authorities in order that action may be taken, and have now the honour to write this reply for Your Excellencies' information.

We have the honour to be, etc.

ANNEXES 6 AND 7

EXCHANGE OF NOTES BETWEEN THE JAPANESE AND CHINESE COMMISSIONERS FOR TREATY REVISION REGARDING THE OPENING OF THE CITY OF PEKING

FROM CHINESE COMMISSIONERS TO JAPANESE COMMISSIONERS

Shanghai, August 10, 1903
(Chinese Calendar)

Gentlemen,

According to the provision of Article X of this Treaty, regarding the establishment in Peking of a place of international residence and trade, it is agreed that in case of and after the complete withdrawal of the foreign troops, now guarding the Legations and Communications, a place in Peking outside the Inner City, convenient to both parties and free from objections, shall be selected and set apart as a place where merchants of all nationalities may reside and carry on trade. Within the limits of this place merchants of all nationalities shall be at liberty to lease land, build houses and warehouses, and establish places of business; but as to the leasing of houses and land belonging to Chinese private individuals, there must be willingness on the part of the owners and the terms thereof must be equitably arranged without any force or compulsion. All roads and bridges in this place will be under the jurisdiction and control of China. Foreigners residing in this place are to observe the Municipal and Police Regulations on the same footing as Chinese residents, and they are not to be entitled to establish a Municipality and Police of their own within its limits except with the consent of the Chinese authorities. When such place of international residence and trade shall have been opened and its limits properly defined, the foreigners who have been residing scattered both within and without the city walls, shall all be required to remove their residence thereto and they shall not be allowed to remain in separate places and thereby cause inconvenience in the necessary supervision by the Chinese authorities. The value of the land and buildings held by such foreigners shall be agreed upon equitably and due compensation therefore shall be paid. The period for such removal shall be determined in due time, and those who do not remove before the expiry of this period shall not be entitled to compensation.

We have considered it to be to our mutual advantage to come to the present basis of understanding in order to avoid future unnecessary negotiations, and we beg that Your Excellencies will consider and agree to it and will favour us with a reply.

We have the honour to be, etc.

FROM JAPANESE COMMISSIONERS TO CHINESE COMMISSIONERS

Shanghai, October 8, 1903

Gentlemen,

We have the honour to acknowledge the receipt of Your Excellencies' despatch of this date in which you state that—

"According to the provision of Article

Digitized by Google

X of this Treaty, regarding the establishment in Peking of a place of international residence and trade, it is agreed that in case of and after the complete withdrawal of the foreign troops, now guarding the Legations and Communications, a place in Peking outside the Inner City, convenient to both parties and free from objections, shall be selected and set apart as a place where merchants of all nationalities may reside and carry on trade. Within the limits of this place merchants of all nationalities shall be at liberty to lease land, build houses and warehouses, and establish places of business; but as to the leasing of houses and land belonging to Chinese private individuals, there must be willingness on the part of the owners and the terms thereof must be equitably arranged without any force or compulsion. All roads and bridges in this place will be under the jurisdiction and control of China. Foreigners residing in this place are to observe the Municipal and Police Regulations on the same footing as Chinese residents, and they are not to be entitled to establish a Municipality and Police of their own within its limits except with the consent of the Chinese authorities. When such place of international residence and trade shall have been opened and its limits properly defined, the foreigners who have been residing scattered both within and without the city walls, shall all be required to remove their residence thereto and they shall not be allowed to remain in separate places and thereby cause inconvenience in the necessary supervision by the Chinese authorities. The value of the land and buildings held by such foreigners shall be agreed upon equitably and due compensation therefor shall be paid. The period for such removal shall be determined in due time, and those who do not remove before the expiry of this period shall not be entitled to compensation.

"We have considered it to be to our mutual advantage to come to the present basis of understanding in order to avoid future unnecessary negotiations, and we beg that Your Excellencies will consider and agree to it and will favour us with a reply."

In reply we beg to inform you that we agree generally to all the terms contained in the despatch under acknowledgement. As to the detailed regulations, these shall in due time be considered and satisfactorily settled in accordance with Article X of this Treaty; but it is understood that such regulations shall not differ in any respect to our prejudice from those which may be agreed upon between China and other Powers. We have the honour to send Your Excellencies this communication in reply and for your information.

We have the honour to be, etc.

AGREEMENT CONCLUDED BETWEEN THE EMPIRE OF JAPAN AND THE REPUBLIC OF CHINA

Signed at Nanking, May 6, 1930

The Government of Japan and the National Government of the Republic of China have, through their respective representatives, agreed upon and concluded the following Articles:—

ARTICLE I

The Japanese and the Chinese Governments agree that all matters relating to rates of duty on the import and export of articles, drawbacks, transit dues and tonnage dues in the territories of Japan and the territories of China shall be regulated exclusively by the laws of Japan and of China respectively.

ARTICLE II

The Governments of Japan and of China shall reciprocally grant to each other and to the nationals of the other country, in customs duties, drawbacks and transit dues and all other similar internal charges, applied to the import and export of articles, and in tonnage dues, as well as in all matters connected therewith, treatment not less favourable than that accorded or to be accorded to its own nationals or to the Government and nationals of any other foreign country.

Digitized by Google

Articles produced or manufactured in the territories of Japan or of China and imported into the territories of the other, from whatever place arriving, shall receive, in import duties, drawbacks and transit dues and all other similar internal charges, and in all matters connected therewith, treatment not to be accorded to the like articles produced or manufactured in any other foreign country.

Articles produced or manufactured in the territories of Japan or of China and exported to the territories of the other shall receive, in export duties, drawbacks and transit dues and all other similar internal charges, and in all matters connected therewith, treatment not less favourable than that accorded to the like articles produced or manufactured in the same territories and exported to any other foreign country.

In regard to tonnage dues and all matters connected therewith vessels of Japan and of China shall each receive in the territories of the other treatment not less favourable than that accorded or to be accorded to the vessels of any other foreign country.

ARTICLE III

The stipulations contained in the foregoing Articles as well as in the exchanged Notes annexed to the present Agreement shall be incorporated in, and form part of, a Treaty of Commerce and Navigation to be negotiated and concluded as soon as possible between the Empire of Japan and the Republic of China.

ARTICLE IV

The Japanese, Chinese and English texts of this Agreement have been carefully compared and verified; but in the event of there being any difference of meaning between them, the sense as expressed in the English text shall be held to prevail.

ARTICLE V

The present Agreement shall enter into force on the tenth day following the date of the signature thereof.

ANNEX I

Nanking, May 6th, 5 Showa (1930)

Monsieur le Ministre,

With reference to the Agreement which we signed to-day I have the honour to state that it is the understanding of the Japanese Government:

1. That, beginning from the date of the coming into force of the above-mentioned Agreement, the Chinese Government will maintain: for a period of three years the rates of duty leviable under Items 1, 2 and 3 in Part I of the Schedule attached hereto, and will also maintain for a period of one year the rates of duty leviable under Item 4 in Part I of the said Schedule, as the maximum rates of Import Duty leviable during the respective periods on articles falling within such Items produced or manufactured in the territories of Japan and imported into the territories of China, subject, however, to the reservation made in the said Schedule by the Chinese Government concerning the increase of rates; and

2. That the Japanese Government will maintain for a period of three years from the date of the coming into force of the above-mentioned Agreement, the rates of duty leviable under the three Items in Part II of the Schedule attached hereto, as the maximum rates of Import Duty leviable during the said period on articles falling within such items produced or manufactured in the territories of China and imported into the territories of Japan.

I shall be much obliged if Your Excellency will be good enough to confirm the foregoing understanding.

I avail myself of this opportunity to renew to Your Excellency the assurances of my highest consideration.

(Signed) M. Shigemitsu.

His Excellency

Dr. Chengting T. Wang

SCHEDULE

Part I

No. of Item	Description of articles	Nos. in Chinese Customs Import Tariff of 1929
1	Cotton goods	1 to 10, 12 to 14, 22 to 24, 26 to 32,

Digitized by Google

No. of Item	Description of articles	Nos. in Chinese Customs Import Tariff of 1929
		37, 38 40, 43, 46, 47, 51, 53 58, 59
2	Fishery and sea products	196 to 199, 202, 205, 206, 213, 216, 217, 218, 231
3	Wheat flour	289
4	Miscellaneous goods	362, 567, 568, 603 to 605 (a), 612, 647, 652 (b), 666 (b), 677 (c), 685, 706, 709 (f), 709 (g), 710, 715

The numbers which appear in Part I of this Schedule indicate the same articles as are mentioned under the corresponding numbers in the Chinese Customs Import Tariff of 1929, with the exception of the following numbers which cover only such articles as are enumerated thereunder :

652 (b)	Rubber shoes and boots, as also footgear made wholly or partly of rubber.
666 (b)	Clocks and movements assembled as a unit, value not over Hk. Tls. 40 per doz.
677 (c)	Hats and caps, of felt made with other materials than beaver or hair, value not over Hk. Tls. 15 per doz.
706	Thermostatic containers and parts thereof, value not over Hk. Tls. 15 per doz.
709 (f)	Electrical machinery and parts thereof
710	Toys and games.
715	Vehicles: velocipedes (e. g., bicycles, etc.), not otheriwise enumerated, value not over Hk. Tls. 40 per piece.

The rates of duty on articles mentioned in Part I of this Schedule shall remain the same as those stated under the corresponding numbers in the aforesaid Tariff, it being understood that, as regards the rates of duty on articles covered by the numbers not underlined, the Chinese Government reserves the right to increase the rates specified above by not more than two and a half per cent. ad valorem. In the case of specific rates of duty, the increase above provided for will be based either uniformly upon the original duty paying value by which the rates in the aforesaid Tariff were determined or uniformly upon the duty paying value which was adopted by the Tariff Valuation Commission in 1928.

The Chinese Government reserves the right to levy an excise on imported Cotton Yarn (No. 51) in addition to the Customs Import Duty.

Part II

No. of item	Description of articles	Nos. in existing Japanese Import Tariff
1	Grass cloth	299. 5, (over 48 centimetres in width excepted) C-1, a-1 to a-4, C-2, a-1 to a-4
2	Silk piece goods	303. 3, A, a, b.
3	Embroidered tissues	300 (Hand-work only)

Unless otherwise specified, the numbers which appear in Part II of this Schedule indicate the same articles as are mentioned under the corresponding numbers in the Japanese Import Tariff at present in force.

The rates of duty on articles mentioned in Item 1 in Part II of this Schedule shall remain the same as those stated under the corresponding numbers in the Japanese Import Tariff at present in force, and the rates of duty on articles mentioned in Items 2 and 3 in Part II of this Schedule shall be thirty per cent. less than those now levied under the Law relating to Import Duties on Luxuries and Similar Articles.

Nanking, May 6th, 19th Year R. C. (1930).

Monsieur le Chargé d'Affaires,

I have the honour to acknowledge the receipt of your Note of to-day's date which reads as follows :

" With reference to the Agreement which we signed to-day I have the honour to state that it is the understanding of the Japanese Government :

Digitized by Google

1. That, beginning from the date of the coming into force of the above-mentioned Agreement, the Chinese Government will maintain for a period of three years the rates of duty leviable under Items 1, 2 and 3 in Part I of the Schedule attached hereto, and will also maintain for a period of one year the rates of duty leviable under Item 4 in Part I of the said Schedule, as the maximum rates of Import Duty leviable during the respective periods on articles falling within such Items produced or manufactured in the territories of Japan and imported into the territories of China, subject, however, to the reservation made in the said Schedule by the Chinese Government concerning the increase of rates; and

2. The rates of duty on articles mentioned in Item 1 in Part II of this Schedule shall remain the same as those stated under the corresponding numbers in the Japanese Import Tariff at present in force, and the rates of duty on articles mentioned in Items 2 and 3 in Part II of this Schedule shall be thirty per cent. less than those now levied under the Law relating to Import Duties on Luxuries and Similar Articles.

ANNEX II

Nanking, May 6th, 19th Year R. C. (1930)

Monsieur le Chargé d'Affaires,

With reference to the Agreement signed this day between China and Japan, I have the honour to request that you will be good enough to confirm, on behalf of the Japanese Government, my understanding that on the expiration of four months after the coming into force of the said Agreement, the reduced rates of the Chinese Customs Tariff heretofore leviable on articles imported or exported across the land frontiers between China and Japan will be abolished and the Customs Tariff without reduction will apply to such articles.

I avail myself of this opportunity to renew to you, Monsieur le Chargé d'Affaires, the assurance of my high consideration.

(Signed) Chengting T. Wang.

Mr. M. Shigemitsu, etc.

Nanking, May 6th, 5 Showa (1930)

Monsieur le Ministre,

I have the honour to acknowledge the receipt of Your Excellency's Note of to-day's date which reads as follows :—

"With reference to the Agreement signed this day between China and Japan, I have the honour to request that you will be good enough to confirm, on behalf of the Japanese Government, my understanding that on the expiration of four months after the coming into force of the said Agreement, the reduced rates of the Chinese Customs Tariff heretofore leviable on articles imported or exported across the land frontiers between China and Japan will be abolished and the Customs Tariff without reduction will apply to such articles."

I have the honour to confirm, on behalf of the Japanese Government, that the above understanding is correct.

I avail myself of this opportunity to renew to Your Excellency the assurances of my highest consideration.

(Signed) M. Shigemitsu.

His Excellency

Dr. Chengting T. Wang, etc.

ANNEX III

Nanking, May 6th, 5 Showa (1930).

Monsieur le Ministre,

I have the honour to remind Your Excellency that in the course of our negotiations regarding the Customs Tariff question, it was stated that the Chinese Government entertained the intention of abolishing as soon as possible all such taxes and charges detrimental to the promotion of trade in China as likin, native customs duties, coast-trade duty and transit dues and other like charges.

I shall be much obliged if Your Excellency will be good enough to inform

Digitized by Google

me as to what measures have been or will be adopted by the Chinese Government with a view to carrying into effect the aforesaid intention of the Chinese Government.

I avail myself of this opportunity to renew to Your Excellency the assurances of my highest consideration.

(Signed) M. Shigemitsu.

His Excellency
Dr. Chengting T. Wang, etc.

Nanking, May 6th, 19th Year R. C. (1930).

Monsieur le Chargé d'Affaires,

I have the honour to acknowledge the receipt of your Note of to-day's date which reads as follows :—

"I have the honour to remind Your Excellency that in the course of our negotiations regarding the Customs Tariff question, it was stated that the Chinese Government entertained the intention of abolishing as soon as possible all such taxes and charges detrimental to the promotion of trade in China as likin, native customs duties, coast-trade duty and transit dues and other like charges.

"I shall be much obliged if Your Excellency will be good enough to inform me as to what measures have been or will be adopted by the Chinese Government with a view to carrying into effect the aforesaid intention of the Chinese Government."

I have the pleasure to inform you that the Chinese Government is endeavouring to abolish as soon and as far as possible all such duties and charges as are mentioned in your Note under acknowledgement.

The Chinese Government has already issued a Mandate ordering the abolition of likin as from the 10th of October, 1930, and instructed the Minister of Finance to take all necessary measures for carrying this order into effect.

I avail myself of this opportunity to renew to you, Monsieur le Chargé d'Affaires, the assurance of my high consideration.

(Signed) Chengting T. Wang.

Mr. M. Shigemitsu, etc.

ANNEX IV

Nanking, May 6th, 5 Showa (1930).

Monsieur le Ministre,

I have the honour to state that in view of the large number and amount of the unsecured and inadequately secured obligations of China due to Japanese creditors, a speedy consolidation thereof is considered highly desirable. It is suggested by my Government that for that purpose a conference of the representatives of creditors should be called by the Chinese Government at the earliest possible date.

I shall be much obliged if Your Excellency will be good enough to inform me as to what measures have been or will be adopted by the Chinese Government for effectuating the aforesaid consolidation.

I avail myself of this opportunity to renew to Your Excellency the assurances of my highest consideration.

(Signed) M. Shigemitsu.

His Excellency
Dr. Chengting T. Wang, etc.

Nanking, May 6th, 19th Year R. C. (1930).

Monsieur le Chargé d'Affaires,

I have the honour to acknowledge the receipt of your Note of to-day's date which reads as follows :—

"I have the honour to state that in view of the large number and amount of the unsecured and inadequately secured obligations of China due to Japanese creditors, a speedy consolidation thereof is considered highly desirable. It is suggested by my Government that for that purpose a conference of the representatives of creditors should be called by the Chinese Government at the earliest possible date.

"I shall be much obliged if Your Excellency will be good enough to inform me as to what measures have been or will be adopted by the Chinese Government for effectuating the aforesaid consolidation."

I have the pleasure to inform you that the Chinese Government has already commenced to set aside annually the sum of $5,000,000 from the Customs

Digitized by Google

revenues for the purpose of consolidating the domestic and foreign obligations of China and that it intends to call a conference of the representatives of creditors on or before October 1st of this year at which an adequate plan for consolidation will be presented and discussed with a view to devising means (including an increase of the sum above mentioned) for effectuating the consolidation in question.

I avail myself of this opportunity to renew to you, Monsieur le Chargé d'Affaires, the assurance of my high consideration.

(Signed) Chengting T. Wang.

Mr. M. Shigemitsu, etc.

TREATY OF COMMERCE AND NAVIGATION BETWEEN JAPAN AND THE UNITED STATES OF AMERICA

Signed at Washington, February 21, 1911

ARTICLE I The subjects or citizens of each of the High Contracting Parties shall have liberty to enter, travel and reside in the territories of the other to carry on trade, wholesale and retail, to own or lease and occupy houses, manufactories, warehouses and shops, to employ agents of their choice, to lease land for residential and commercial purposes, and generally to do anything incident to or necessary for trade upon the same terms as native subjects or citizens, submitting themselves to the laws and regulations there established.

They shall not be compelled, under any pretext whatever, to pay any charges or taxes other or higher than those that are or may be paid by native subjects or citizens.

The subjects or citizens of each of the High Contracting Parties shall receive, in the territories of the other, the most constant protection and security for their persons and property, and shall enjoy in this respect the same rights and privileges as are or may be granted to native subjects or citizens, on their submitting themselves to the conditions imposed upon the native subjects or citizens.

They shall, however, be exempt in the territories of the other from compulsory military service either on land or sea, in the regular forces, or in the national guard, or in the militia; from all contributions imposed in lieu of personal service, and from all forced loans or military exactions or contributions.

ARTICLE II The dwellings, warehouses, manufactories and shops of the subjects or citizens of each of the High Contracting Parties in the territories of the other, and all premises appertaining thereto used for purposes of residence or commerce, shall be respected. It shall not be allowable to proceed to make a domiciliary visit to, or a search of, any such buildings and premises, or to examine or inspect books, papers or accounts, except under the conditions and with the forms prescribed by the laws, ordinances and regulations for nationals.

ARTICLE III Each of the High Contracting Parties may appoint Consuls-General, Consuls, Vice-Consuls, Deputy Consuls and Consular Agents in all ports, cities and places of the other, except in those where it may not be convenient to recognize such officers. This exception, however, shall not be made in regard to one of the Contracting Parties without being made likewise in regard to all other Powers.

Such Consuls General, Consuls, Vice Consuls, Deputy Consuls and Consular Agents having received exequaturs or other sufficient authorizations from the Government of the country to which they are appointed, shall, on condition of reciprocity, have the right to exercise the functions and to enjoy the exemptions and immunities which are or may hereafter be granted to the consular officers of the same rank of the most favoured nation. The Government issuing exequaturs or other authorizations may in its discretion can-

Digitized by Google

cel the same on communicating the reasons for which it thought proper to do so.

ARTICLE IV There shall be between the territories of the two High Contracting Parties reciprocal freedom of commerce and navigation. The subjects or citizens of each of the Contracting Parties, equally with the subjects or citizens of the most favored nation, shall have liberty freely to come with their ships and cargoes to all places, ports and rivers in the territories of the other which are or may be opened to foreign commerce, subject always to the laws of the country to which they thus come.

ARTICLE V The import duties on articles, the produce or manufacture of the territories of one of the High Contracting Parties, upon importation into the territories of the other, shall henceforth be regulated either by special arrangements between the two countries or by the internal legislation of each.

Neither Contracting Party shall impose any other or higher duties or charges on the exportation of any article to the territories of the other than are or may be payable on the exportation of the like article to any other foreign country.

Nor shall any prohibition be imposed by either country on the importation or exportation of any article from or to the territories of the other which shall not equally extend to the like article imported from or exported to any other country. The last provision is not, however, applicable to prohibitions or restrictions maintained or imposed as sanitary measures or for purposes of protecting animals and useful plants.

ARTICLE VI The subjects or citizens of each of the High Contracting Parties shall enjoy in the territories of the other exemption from all transit duties and a perfect equality of treatment with native subjects or citizens in all that relates to warehousing, bounties, facilities and drawbacks.

ARTICLE VII Limited-liability and other companies and associations, commercial, industrial, and financial, already or hereafter to be organized in accordance with the laws of either High Contracting Party and domiciled in the territories of such Party, are authorized, in the territories of the other, to exercise their rights and appear in the courts either as plaintiffs or defendants, subject to the laws of such other Party.

The foregoing stipulation has no bearing upon the question whether a company or association organized in one of the two countries will or will not be permitted to transact its business or industry in the other, this permission remaining always subject to the laws and regulations enacted or established in the respective countries or in any part thereof.

ARTICLE VIII All articles which are or may be legally imported into the ports of either High Contracting Party from foreign countries in national vessels may likewise be imported into those in vessels of the other Contracting Party, without being liable to any other or higher duties or charges of whatever denomination than if such articles were imported in national vessels. Such reciprocal equality of treatment shall take effect without distinction, whether such articles come directly from the place of origin or from any other foreign place.

In the same manner, there shall be perfect equality of treatment in regard to exportation, so that the same export duties shall be paid, and the same bounties and drawbacks allowed, in the territories of each of the Contracting Parties on the exportation of any article which is or may be legally exported therefrom, whether such exportation shall take place in Japanese vessels or in vessels of the United States, and whatever may be the place of destination, whether a port of the other Party or of any third Power.

ARTICLE IX In all that the stationing, loading and unloading of vessels in the ports of the territories of the High Contracting Parties, no privileges shall be granted by either Party to national vessels which are not equally, in like cases, granted to the vessels of the other country; the intention of the Contracting Parties being that in these respects the respective vessels shall be treated on the footing of perfect equality.

ARTICLE X Merchant vessels navigating under the flag of Japan or that

Digitized by Google

of the United States and carrying the papers required by their national laws to prove their nationality shall in the United States and in Japan be deemed to be vessels of Japan or of the United States, respectively.

ARTICLE XI No duties of tonnage, harbour, pilotage, lighthouse, quarantine, or other similar or corresponding duties of whatever denomination, levied in the name or for the profit of Government, public functionaries, private individuals, corporations or establishments of any kind shall be imposed in the ports of the territories of either country upon the vessels of the other which shall not equally, under the same conditions, be imposed on national vessels in general, or on vessels of the most favoured nation. Such equality of treatment shall apply reciprocally to the respective vessels from whatever place they may arrive and whatever may be their place of destination.

ARTICLE XII Vessels charged with performance of regular scheduled postal service of one of the High Contracting Parties, whether belonging to the State or subsidized by it for the purpose, shall enjoy, in the ports of the territories of the other, the same facilities, privileges and immunities as are granted to like vessels of the most favoured nation.

ARTICLE XIII The coasting trade of the High Contracting Parties is excepted from the provisions of the present Treaty and shall be regulated according to the laws of Japan and the United States, respectively. It is, however, understood that the subjects or citizens of either Contracting Party shall enjoy in this respect most-favoured-nation treatment in the territories of the other.

A vessel of one of the Contracting Parties, laden in a foreign country with cargo destined for two or more ports of entry in the territories of the other, may discharge a portion of her cargo at one of the said ports, and, continuing her voyage to the other port or ports of destination, there discharge the remainder of her cargo, subject always to the laws, tariffs and customs regulations of the country of destination; and, in like manner and under the same reservation, the vessels of one of the Contracting Parties shall be permitted to load at several ports of the other for the same outward voyages.

ARTICLE XIV Except as otherwise expressly provided in this Treaty, the High Contracting Parties agree that, in all that concerns commerce and navigation, any privilege, favour or immunity which either Contracting Party has actually granted, or may hereafter grant, to the subjects or citizens of any other State shall be extended to the subjects or citizens of the other Contracting Party gratuitously, if the concession in favour of that other State shall have been gratuitous, and on the same or equivalent conditions, if the concession shall have been conditional.

ARTICLE XV The subjects or citizens of each of the High Contracting Parties shall enjoy in the territories of the other the same protection as native subjects or citizens in regard to patents, trade-marks and designs, upon fulfillment of the formalities prescribed by law.

ARTICLE XVI The present Treaty shall, from the date on which it enters into operation, supersede the Treaty of Commerce and Navigation dated the 22nd day of November, 1894; and from the same date the last-named Treaty shall cease to be binding.

ARTICLE XVII The present Treaty shall enter into operation on the 17th of July, 1911, and shall remain in force twelve years or until the expiration of six months from the date on which either of the Contracting Parties shall have given notice to the other of its intention to terminate the Treaty.

In case neither of the Contracting Parties shall have given notice to the other six months before the expiration of the said period of twelve years of its intention to terminate the Treaty, it shall continue operative until the expiration of six months from the date on which either Party shall have given such notice.

TREATY OF COMMERCE AND NAVIGATION BETWEEN JAPAN AND GREAT BRITAIN

Signed at London, April 3, 1911

ARTICLE I The subjects of each of the High Contracting Parties shall have full liberty to enter, travel, and reside in the territories of the other, and, conforming themselves to the laws of the country—

1. Shall, in all that relates to travel and residence, be placed in all respects on the same footing as native subjects.

2. They shall have the right, equally with native subjects, to carry on their commerce and manufacture, and to trade in all kinds of merchandise of lawful commerce, either in person or by agents, singly or in partnerships with foreign or native subjects.

3. They shall in all that relates to the pursuit of their industries, callings, professions, and educational studies be placed in all respects on the same footing as the subjects or citizens of the most favoured nation.

4. They shall be permitted to own or hire and occupy houses, manufactories, warehouses, shops, and premises which may be necessary for them, and to lease land for residential, commercial, industrial, and other lawful purposes, in the same manner as native subjects.

5. They shall, on condition of reciprocity, be at full liberty to acquire and possess every description of property, movable or immovable, which the laws of the country permit or shall permit the subjects or citizens of any other foreign country to acquire and possess, subject always to the conditions and limitations prescribed in such laws. They may dispose of the same by sale, exchange, gift, marriage, testaments, or in any other manner, under the same conditions which are or shall be established with regard to native subjects. They shall also be permitted, on compliance with the laws of the country, freely to export the proceeds of the sale of their property and their goods in general without being subjected as foreigners to other or higher duties than those to which subjects of the country would be liable under similar circumstances.

6. They shall enjoy constant and complete protection and security for their persons and property; shall have free and easy access to the Courts of Justice and other tribunals in pursuit and defence of their claims and rights; and shall have full liberty, equally with native subjects, to choose and employ lawyers and advocates to represent them before such Courts and tribunals; and generally shall have the same rights and privileges as native subjects in all that concerns the administration of justice.

7. They shall not be compelled to pay taxes, fees, charges, or contributions of any kind whatever, other or higher than those which are or may be paid by native subjects or the citizens of the most favoured nation.

8. And they shall enjoy a perfect equality of treatment with native subjects in all that relates to facilities for warehousing under bond, bounties, and drawbacks.

ARTICLE II The subjects of each of the High Contracting Parties in the territories of the other shall be exempted from all compulsory military services, whether in the army, navy, national guard, or militia; and from all forced loans and military requisitions or contributions unless imposed on them equally with native subjects as owners, lessees, or occupiers of immovable property.

In the above respects the subjects of each of the High Contracting Parties shall not be accorded in the territories of the other less favourable treatment than that which is or may be accorded to subjects or citizens of the most favoured nation.

ARTICLE III The dwellings, warehouses, manufactories, and shops of the subjects of each of the High Contracting Parties in the territories of the other, and all premises appertaining thereto used for lawful purposes, shall

Digitized by Google

be respected. It shall not be allowable to proceed to make a domiciliary visit to, or a search of, any such buildings and premises, or to examine or inspect books, papers, or accounts, except under the conditions and with the forms presented by the laws for native subjects.

ARTICLE IV Each of the High Contracting Parties may appoint Consuls-General, Consuls, Vice-Consuls, and Consular Agents in all the ports, cities, and places of the other, except in those where it may not be convenient to recognize such officers. This exception, however, shall not be made in regard to one of the High Contracting Parties without being made likewise in regard to all other Powers.

Such Consuls-General, Consuls, Vice-Consuls, and Consular Agents, having received exequaturs or other sufficient authorizations from the Government of the country to which they are appointed, shall have the right to exercise their functions, and to enjoy the privileges, exemptions, and immunities which are or may be granted to the Consular officers of the most favoured nation. The Government issuing exequaturs or other authorizations has the right in its discretion to cancel the same on explaining the reasons for which it thought proper to do so.

ARTICLE V In case of the death of a subject of one of the High Contracting Parties in the territories of the other, without leaving at the place of his decease any person entitled by the laws of his country to take charge of and administer the estate, the competent Consular officer of the State to which the deceased belonged shall, upon fulfilment of the necessary formalities, be empowered to take custody of and administer the estate in the manner and under the limitations prescribed by the law of the country in which the property of the deceased is situated.

The foregoing provision shall also apply in case of a subject of one of the High Contracting Parties dying outside the territories of the other, but possessing property therein, without leaving any person there entitled to take charge of and administer the estate.

It is understood that in all that concerns the administration of the estates of deceased persons, any right, privilege, favour, or immunity which either of the High Contracting Parties has actually granted, or may hereafter grant, to the Consular officers of any other foreign State shall be extended immediately and unconditionally to the Consular officers of the other High Contracting Party.

ARTICLE VI There shall be between the territories of the two High Contracting Parties reciprocal freedom of commerce and navigation. The subjects of each of the High Contracting Parties shall have liberty freely to come with their ships and cargoes to all places, ports, and rivers in the territories of the other, which are or may be opened to foreign commerce, and conforming themselves to the laws of the country to which they thus come, shall enjoy the same rights, privileges, liberties, favours, immunities, and exemptions in matters of commerce and navigation as are or may be enjoyed by native subjects.

ARTICLE VII Articles, the produce or manufacture of the territories of one High Contracting Party, upon importation into the territories of the other, from whatever place arriving, shall enjoy the lowest rates of customs duty applicable to similar articles of any other foreign origin.

No prohibition or restriction shall be maintained or imposed on the importation of any article, the produce or manufacture of the territories of either of the High Contracting Parties, into the territories of the other, from whatever place arriving, which shall not equally extend to the importation of the like articles, being the produce or manufacture of any other foreign country. This provision is not applicable to the sanitary or other prohibitions occasioned by the necessity of securing the safety of persons, or of cattle, or of plants useful to agriculture.

ARTICLE VIII The articles, the produce or manufacture of the United Kingdom, enumerated in Part 1 of the Schedule annexed to this Treaty, shall not, on importation into Japan, be subjected to higher customs duties than those specified in the Schedule.

Digitized by Google

The articles, the produce or manufacture of Japan, enumerated in Part 2 of the Schedule annexed to this Treaty, shall be free of duty on importation into the United Kingdom.

Provided that if at any time after the expiration of one year from the date this Treaty takes effect either of the High Contracting Parties desires to make a modification in the Schedule it may notify its desire to the other High Contracting Party, and thereupon negotiations for the purpose shall be entered into forthwith. If the negotiations are not brought to a satisfactory conclusion within six months from the date of notification, the High Contracting Party which gave the notification may, within one month, give six months' notice to abrogate the present Article, and on the expiration of such notice the present Article shall cease to have effect, without prejudice to the other stipulations of this Treaty.

ARTICLE IX Articles, the produce or manufacture of the territories of one of the High Contracting Parties, exported to the territories of the other, shall not be subjected on export to other or higher charges than those paid on the like articles exported to any other foreign country. Nor shall any prohibition or restriction be imposed on the exportation of any article from the territories of either of the two High Contracting Parties to the territories of the other which shall not equally extend to the exportation of the like article to any other foreign country.

ARTICLE X Articles, the produce or manufacture of the territories of one of the High Contracting Parties, passing in transit through the territories of the other, in conformity with the laws of the country, shall be reciprocally free from all transit duties, whether they pass direct, or whether during transit they are unloaded, warehoused, and reloaded.

ARTICLE XI No internal duties levied for the benefit of the State, local authorities, or corporations which affect, or may affect, the production, manufacture, or consumption of any article in the territories of either of the High Contracting Parties shall for any reason be a higher or more burdensome charge on articles, the produce or manufacture of the territories of the other, than on similar articles of native origin.

The produce or manufacture of the territories of either of the High Contracting Parties imported into the territories of the other, and intended for warehousing or transit, shall not be subjected to any internal duty.

ARTICLE XII Merchants and manufacturers, subjects of one of the High Contracting Parties, as well as merchants and manufacturers domiciled and exercising their commerce and industries in the territories of such party, may, in the territories of the other, either personally or by means of commercial travellers, make purchases or collect orders, with or without samples, and such merchants, manufacturers, and their commercial travellers, while so making purchases and collecting orders, shall, in the matter of taxation and facilities, enjoy the most-favoured-nation treatment.

Articles imported as samples for the purpose above mentioned shall, in each country, be temporarily admitted free of duty on compliance with the Customs regulations and formalities established to assure their re-exportation or the payment of the prescribed customs duties if not re-exported within the period allowed by law. But the foregoing privilege shall not extend to articles which, owing to their quantity or value, cannot be considered as samples, or which owing to their nature, could not be identified upon re-exportation. The determination of the question of the qualification of samples for duty-free admission rests in all cases exclusively with the competent authorities of the place where the importation is effected.

ARTICLE XIII The marks, stamps, or seals placed upon the samples mentioned in the preceding Article by the Customs authorities of one country at the time of exportation, and the officially attested list of such samples containing a full description thereof issued by them, shall be reciprocally accepted by the Customs officials of the other as establishing their character so far as may be necessary to establish that the samples produced are those enumerated in the list. The Customs authorities

Digitized by Google

of either country may, however, affix a supplementary mark to such samples in special cases where they may think this precaution necessary.

ARTICLE XIV The Chambers of Commerce, as well as such other Trade Associations and other recognized Commercial Associations in the territories of the High Contracting Parties as may be authorized in this behalf, shall be mutually accepted as competent authorities for issuing any certificates that may be required for commercial travellers.

ARTICLE XV Limited liability and other companies and associations, commercial, industrial, and financial, already or hereafter to be organized in accordance with the laws of either High Contracting Party, and registered in the territories of such Party, are authorized, in the territories of the other, to exercise their rights and appear in the Courts either as plaintiffs or defendants, subject to the laws of such other Party.

ARTICLE XVI Each of the High Contracting Parties shall permit the importation or exportation of all merchandise which may be legally imported or exported, and also the carriage of passengers from or to their respective territories, upon the vessels of the other; and such vessels, their cargoes and passengers shall enjoy the same privileges as, and shall not be subjected to any other or higher duties or charges than, national vessels and their cargoes and passengers.

ARTICLE XVII In all that regards the stationing, loading, and unloading of vessels in the ports, docks, roadsteads, and harbours of the High Contracting Parties, no privileges or facilities shall be granted by either Party to national vessels which are not equally, in like cases, granted to the vessels of the other country; the intention of the High Contracting Parties being that in these respects also the vessels of the two countries shall be treated on the footing of perfect equality.

ARTICLE XVIII All vessels which according to Japanese law are to be deemed Japanese vessels, and all vessels which according to British law are to be deemed British vessels, shall, for the purpose of this Treaty, be deemed Japanese and British vessels respectively.

ARTICLE XIX No duties of tonnage, harbour, pilotage, lighthouse, quarantine, or other analogous duties or charges of whatever nature, or under whatever denomination, levied in the name or for the profit of Government, public functionaries, private individuals, corporations, or establishments of any kind, shall be imposed in the ports of either country upon the vessels of the other which shall not equally, under the same conditions, be imposed in like cases on national vessels in general, or vessels of the most favoured nation. Such equality of treatment shall apply to the vessels of either country from whatever place they may arrive and whatever may be their destination.

ARTICLE XX Vessels charged with performance of regular scheduled postal service of one of the High Contracting Parties shall enjoy in the territorial waters of the other the same special facilities, privileges, and immunities as are granted to like vessels of the most favoured nation.

ARTICLE XXI The coasting trade of the High Contracting Parties is excepted from the provisions of the present Treaty, and shall be regulated according to the laws of Japan and the United Kingdom respectively. It is, however, understood that the subjects and vessels of either High Contracting Party shall enjoy in this respect most-favoured-nation treatment in the territories of the other.

Japanese and British vessels may, nevertheless, proceed from one port to another, either for the purpose of landing the whole or part of their passengers or cargoes brought from abroad, or of taking on board the whole or part of their passengers or cargoes for a foreign destination.

It is also understood that, in the event of the coasting trade of either country being exclusively reserved to national vessels, the vessels of the other country, if engaged in trade to or from places not within the limits of the coasting trade so reserved, shall not be prohibited from the carriage between two ports of the former country of passengers holding through tickets, or mer-

Digitized by Google

chandise consigned on through bills of lading to or from places not within the above-mentioned limits, and while engaged in such carriage these vessels and their cargoes shall enjoy the full privileges of this Treaty.

ARTICLE XXII If any seaman should desert from any ship belonging to either of the High Contracting Parties in the territorial waters of the other, the local authorities shall, within the limits of law, be bound to give every assistance in their power for the recovery of such deserter, on application to that effect being made to them by the competent Consular officer of the country to which the ship of the deserter may belong, accompanied by an assurance that all expenses connected therewith will be repaid.

It is understood that this stipulation shall not apply to the subjects of the country where the desertion takes place.

ARTICLE XXIII Any vessel of either of the High Contracting Parties which may be compelled, by stress of weather or by accident, to take shelter in a port of the other shall be at liberty to refit therein, to procure all necessary stores, and to put to sea again, without paying any dues other than such as would be payable in the like case by a national vessel. In case, however, the master of a merchant-vessel should be under the necessity of disposing of a part of his merchandise in order to defray the expenses, he shall be bound to conform to the Regulations and Tariffs of the place to which he may have come.

If any vessel of one of the High Contracting Parties should run aground or be wrecked upon the coasts of the other, such vessel, and all parts thereof, and all furniture and appurtenances belonging thereunto, and all goods and merchandise saved therefrom, including any which may have been cast into the sea, or the proceeds thereof, if sold, as well as all papers found on board such stranded or wrecked vessel, shall be given up to the owners or their agents when claimed by them. If there are no such owners or agents on the spot, then the same shall be delivered to the Japanese or British Consular officer in whose district the wreck or stranding may have taken place upon being claimed by him within the period fixed by the laws of the country, and such Consular officer, owners, or agents shall pay only the expenses incurred in the preservation of the property, together with the salvage or other expenses which would have been payable in the like case of a wreck or stranding of a national vessel.

The High Contracting Parties agree, moreover, that merchandise saved shall not be subjected to the payment of any customs duty unless cleared for internal consumption.

In the case either of a vessel being driven in by stress of weather, run aground, or wrecked, the respective Consular officers shall, if the owner or master or other agent of the owner is not present, or is present and requires it, be authorized to interpose in order to afford the necessary assistance to their fellow-country-men.

ARTICLE XXIV The High Contracting Parties agree that, in all that concerns commerce, navigation, and industry, any favour, privilege, or immunity which either High Contracting Party has actually granted, or may hereafter grant, to the ships, subjects, or citizens of any other foreign State shall be extended immediately and unconditionally to the ships or subjects of the other High Contracting Party, it being their intention that the commerce, navigation, and industry of each country shall be placed in all respects on the footing of the most favoured nation.

ARTICLE XXV The stipulations of this Treaty do not apply to tariff concessions granted by either of the High Contracting Parties to contiguous States solely to facilitate frontier traffic within a limited zone on each side of the frontier, or to the treatment accorded to the produce of the national fisheries of the High Contracting Parties, or to special tariff favours granted by Japan in regard to fish and other aquatic products taken in the foreign waters in the vicinity of Japan.

ARTICLE XXVI The stipulations of the present Treaty shall not be applicable to any of His Britannic Majesty's Dominions, Colonies, Possessions, or Protectorates, beyond the Seas, unless notice of adhesion shall have been given on behalf of any such Dominion, Colony,

Digitized by Google

Possession, or Protectrate by His Britannic Majesty's Representative at Tokio before the expiration of two years from the date of the exchange of the ratifications of the present Treaty.

ARTICLE XXVII The present Treaty shall be ratified, and the ratifications exchanged at Tokio as soon as possible. It shall enter into operation on the 17th July, 1911, and remain in force until the 16th July, 1923. In case neither of the High Contracting Parties shall have given notice to the other twelve months before the expiration of the said period, of its intention to terminate the Treaty, it shall continue operative until the expiration of one year from the date on which either of the High Contracting Parties shall have denounced it.

As regards the British Dominions, Colonies, Possessions, and Protectorates to which the present Treaty may have been made applicable in virtue of Article 26, however, either of the High Contracting Parties shall have the right to terminate it separately at any time on given twelve months' notice to that effect. It is undesrtood that the stipulations of the present and of the preceding Article referring to British Dominions, Colonies, Possessions, and Protectorates apply also to the island of Cyprus.

IMPERIAL ORDINANCE NO. 208, WHICH BECAME APPLICABLE TO CANADA, JULY 20, 1935

ARTICLE I An import duty of 50 per cent. *ad valorem*, in addition to the import duties enumerated in the Import Tariff annexed to the Customs Tariff Law, shall, in accordance with the provisions of Article I of Law No. 45, 1934, and for the duration of one year from the date of coming into force of the present Ordinance, be imposed on articles produced or manufactured in countries with which the trade balance of Japan in 1934 was in excess in imports and which, at the time of coming into force of the present Ordinance, employ, in respect of goods produced or manufactured in Japan, arbitrary standards of value for the assessments of import duties and impose on such goods special taxes or duties in addition to ordinary imports duties. The same shall apply to articles manufactured at bonded factories with the aforesaid articles as material.

The articles mentioned in the preceding Paragraph are restricted to those of the articles enumerated in the Import Tariff annexed to the Customs Tariff Law, which are set forth in the List appended to the present Ordinance.

The countries referred to in the first Paragraph hereof shall be proclaimed by the competent Minister of State.

ARTICLE II Any person who imports any of those of the articles enumerated in the Import Tarriff annexed to the Customs Tariff Law, which are set forth in the List appended to the present Ordinance, shall attach a Certificate of Origin to the Import Declaration; except when such article is mail matter or when the cost price of the same does not exceed ¥100.

The Certificate of Origin above referred to shall designate the marks, numbers, names, number and quantity of the article to be imported and also the locality where it was produced or manufactured, and shall be attested by the Imperial Consulate or, if it does not exist, by the Customs House, other Governmental or public office or the Chamber of Commerce and Industry, existing in the place where the said article was produced, manufactured, purchased or shipped; unless otherwise provided by treaty, in which case such treaty provisions shall prevail.

ARTICLE III The term "competent Minister of State", occurring in the present Ordinance, applies, in Chosen, to the Governor-General of Chosen, and, in Taiwan, to the Governor-General of Taiwan.

TRAITÉ DE PAIX ENTRE LE JAPON ET LA RUSSIE

Signé à Portsmouth, en français et anglais, le 5 septembre, 1905 (38éme année de Meiji)

ARTICLE I

Il y aura à l'avenir paix et amitié entre Leurs Majestés l'Empereur du Japon et l'Empereur de toutes les Russies, ainsi qu'entre Leurs Etats et sujets respectifs.

ARTICLE 2

Le Gouvernement Impérial de Russie, reconnaissant que le Japon possède en Corée des intérêts prédominants politiques, militaires et économiques, s'engage à ne point intervenir ni mettre d'obstacles aux mesures de direction, de protection et de controle que le Gouvernement Impérial du Japon pourrait considérer nécessaire de prendre en Corée.

Il est entendu que les sujets russes en Corée seront traités exactement de la même manière que les ressortissants des autres pays étrangers, à savoir qu'ils seront placés sur le même pied que les ressortissants de la nation la plus favorisée.

Il est de même convenu que pour éviter toute cause de malentendu, les deux Hautes Parties Contractantes s'abstiendront, sur la frontière russo-coréenne, de prendre toute mesure militaire qui pourrait menacer la sécurité du territoire russe ou coréen.

ARTICLE 3

Le Japon et la Russie s'engagent mutuellement :

1. A évacuer complètement et simultanément la Manchourie à l'exception du territoire sur lequel s'étend le bail de

Digitized by Google

la presqu'île de Liaotung, conformément aux dispositions de l'Article additionnel 1 annexé à ce Traité ; et

2. À restituer entièrement et complètement à l'administration exclusive de la Chine toutes les parties de la Manchourie qui sont occupées maintenant par les troupes japonaises ou russes ou qui sont sous leur controle, à l'exception du territoire susmentionné.

Le Gouvernement Impérial de Russie déclare qu'il n'a point en Manchourie d'avantages territoriaux ou concessions préférentielles ou exclusives de nature à porter atteinte à la souveraineté de la Chine ou incompatibles avec le principe d'opportunité égale.

ARTICLE 4

Le Japon et la Russie s'engagent réciproquement à ne mettre aucun obstacle aux mesures générales qui s'appliquent également à toutes les nations et que la Chine pourrait prendre pour le développement du commerce et de l'industrie en Manchourie.

ARTICLE 5

Le Gouvernement Impérial de Russie cède au Gouvernement Impérial du Japon, avec le consentement du Gouvernement de Chine, le bail de Port Arthur, de Talien et des territoires et eaux territoriales adjacents, ainsi que tous les droits, privilèges et concessions se rattachant à ce bail ou en faisant partie, et il cède, de même, au Gouvernement Impérial du Japon, tous les travaux et propriétés publics dans le territoire sur lequel s'étend le bail susmentionné.

Les deux Hautes Parties Contractantes s'engagent mutuellement à obtenir du Gouvernement de Chine le consentement mentionné dans la stipulation ci-dessus.

Le Gouvernement Impérial du Japon donne, de sa part, l'assurance que les droits de propriété des sujets russes dans le territoire susmentionné seront parfaitement respectés.

ARTICLE 6

Le Gouvernement Impérial de Russie s'engage à céder au Gouvernement Impérial du Japon, sans compensation, avec le consentement du Gouvernement de Chine, le chemin de fer entre Tchan-Tchoun (Kouan-Tchen-Tsy) et Port Arthur et tous ses embranchements avec tous les droits, privilèges et propriétés y appartenant dans cette région, ainsi que toutes les mines de charbon dans ladite région, appartenant à ce chemin de fer ou en exploitation pour son profit.

Les deux Hautes Parties Contractantes s'engagent mutuellement à obtenir du Gouvernement de Chine le consentement mentionné dans la stipulation ci-dessus.

ARTICLE 7

Le Japon et la Russie s'engagent à exploiter leurs chemins de fer respectifs en Manchourie exclusivement dans un but commercial et industriel, mais nullement dans un but stratégique.

Il est entendu que cette restriction ne s'applique pas aux chemins de fer dans le territoire sur lequel s'étend le bail de la presqu'île de Liaotung.

ARTICLE 8

Les Gouvernements Impériaux du Japon et de Russie, en vue de favoriser et de faciliter les relations et le traffic, concluront, aussitot que possible, une convention séparée pour le règlement de leurs services de raccordement de chemins de fer en Manchourie.

ARTICLE 9

Le Gouvernement Impérial de Russie cède au Gouvernement Impérial du Japon en perpétuité et en pleine souveraineté la partie sud de l'île de Sakhaline et toutes les îles qui y sont adjacentes, ainsi que tous les travaux et propriétés publics qui s'y trouvent. Le cinquantième parallèle de latitude nord est adopté comme la limite du territoire cédé. La ligne frontière exacte de ce territoire sera déterminée conformément aux dispositions de l'Article additionnel 2 annexé à ce Traité.

Le Japon et la Russie conviennent mutuellement de ne construire dans leurs possessions respectives sur l'île de Sakhaline et sur les îles qui y sont adjacentes aucune fortification ni travaux militaires semblables. De même, ils s'engagent respectivement à ne prendre aucune mesure militaire qui pourrait entraver la libre navigation des Détroits de La Pérpose et de Tartarie.

ARTICLE 10

Il est réservé aux sujets russes habitants du territoire cédé au Japon de

Digitized by Google

vendre leurs propriétés immobilières et de se retirer dans leur pays ; mais, s'ils, préfèrent rester dans le territoire cédé, ils seront maintenus et protégés dans le plein exercice de leurs industries et droits de propriété à la condition de se soumettre aux lois et à la jurisdiction japonaises. Le Japon aura la pleine liberté de retirer le droit de résidence dans ce territoire à tous les habitants se trouvant dans l'incapacité politique ou administrative, ou de les déporter de ce territoire. Il s'engage toutefois à ce que les droits de propriété de ces habitants soient pleinement respectés.

ARTICLE 11

La Russie s'engage à s'entendre avec le Japon pour concéder aux sujets japonais des droits de pêche le long des cotes des possessions russes dans les Mers du Japon, d'Okhotsk et de Behring.

Il est convenu que l'engagement susmentionné ne portera pas atteinte aux droits déjà appartenant aux sujets russes ou étrangers dans ces régions.

ARTICLE 12

Le Traité de Commerce et de Navigation entre le Japon et la Russie ayant été annulé par la guerre, les Gouvernements Impériaux du Japon et de Russie s'engagent à adopter comme base de leurs relations commerciales, jusqu'à la conclusion d'un nouveau traité de commerce et de navigation sur la base du Traité qui était en vigueur antérieurement à la guerre actuelle, le système du traitement réciproque sur le pied de la nation la plus favorisée, y compris les tarifs d'importation, et d'exportation, les formalités de douane, les droits de transit et de tonnage et l'admission et le traitement des agents, des sujets et des vaisseaux d'un pays dans le territoire de l'autre.

ARTICLE 13

Aussitôt que possible aprés la mise en vigueur du présent Traité, tous les prisonniers de guerre seront réciproquement restitués. Les Gouvernements Impériaux du Japon et de Russie nommeront, chacun de son coté, un Commissaire spécial qui se chargera des prisonniers. Tous les prisonniers se trouvant entre les mains de l'un des Gouvernements seront remis au Commissaire de l'autre Gouvernement, ou à son représentant dûment autorisé, qui les recevra en tel nombre et dans tels ports convenables de l'État remettant que ce dernier aurait notifié d'avance au Commissaire de l'État recevant.

Les Gouvernements du Japon et de Russie présenteront l'un à l'autre, le plus tôt possible après que la remise des prisonniers aura été achevée, un compte documenté des dépenses directes faites respectivement par eux pour le soin et l'entretien des prisonniers depuis la date de la capture ou de la reddition jusqu'à celle de la mort ou de la remise. La Russie s'engage à rembourser au Japon, aussitot que possible aprés L'échange de ces comptes comme il est stipulé ci-dessus, la différence entre le montant réel ainsi dépensé par le Japon et le montant réel également déboursé, par la Russie.

THE CONVENTION EMBODYING BASIC RULES OF THE RELATIONS BETWEEN JAPAN AND THE UNION OF SOVIET SOCIALIST REPUBLICS

Signed at Peking, January 20, 1925

ARTICLE I The High Contracting Parties agree that with the coming into force of the present Convention, diplomatic and consular relations shall be established between them.

ARTICLE II The Union of Soviet Socialist Republics agrees that the Treaty of September 5th, 1905, shall remain in full force.

It is agreed that the Treaties, Conventions and Agreements, other than the said Treaty of Portsmouth, which were concluded between Japan and Russia prior to November 7, 1917, shall be

Digitized by Google

re-examined at a Conference to be subsequently held between the Governments of the High Contracting Parties and are liable to revision or annulment as altered circumstances may require.

ARTICLE III The Governments of the High Contracting Parties agree that upon the coming into force of the present Convention, they shall proceed to the revision of the Fishery Convention of 1907, taking into consideration such changes as may have taken place in the general conditions since the conclusion of the said Fishery Convention.

Pending the conclusion of a convention so revised, the Government of the Union of Soviet Socialist Republics shall maintain the practices established in 1924 relating to the lease of fishery lots to Japanese subjects.

ARTICLE IV The Governments of the High Contracting Parties agree that upon the coming into force of the present Convention, they shall proceed to the conclusion of a treaty of commerce and navigation in conformity with the principles hereunder mentioned, and that pending the conclusion of such a treaty, the general intercourse between the two countries shall be regulated by those principles.

(1) The subjects or citizens of each of the High Contracting Parties shall in accordance with the laws of the country: a / have liberty to enter, travel and reside in the territories of the other, and b / enjoy constant and complete protection for the safety of their lives and property.

(2) Each of the High Contracting Parties shall in accordance with the laws of the country accord in its territories to the subjects or citizens of the other, to the widest possible extent and on condition of reciprocity, the right of private ownership and the liberty to engage in commerce, navigation, industries, and other peaceful pursuits.

(3) Without prejudice to the right of each Contracting Party to regulate by its own laws the system of international trade in that country, it is understood that neither Contracting Party shall apply in discrimination against the other Party any measures of prohibition, restriction or impost which may serve to hamper the growth of the intercourse, economic or otherwise, between the two countries, it being the intention of both Parties to place the commerce, navigation and industry of each country, as far as possible, on the footing of the most favoured nation.

The Governments of the High Contracting Parties further agree that they shall enter into negotiations, from time to time as circumstances may require, for the conclusion of special arrangements relative to commerce and navigation to adjust and to promote economic relations between the two countries.

ARTICLE V The High Contracting Parties solemnly affirm their desire and intention to live in peace and amity with each other, scrupulously to respect the undoubted right of a State to order its own life within its own jurisdiction in its own way, to refrain and restrain all persons in any governmental service for them, and all organizations in receipt of any financial assistance from them, from any act overt or covert liable in any way whatever to endanger the order and security in any part of the territories of Japan or the Union of Soviet Socialist Republics.

It is further agreed that neither Contracting Party shall permit the presence in the territories under its jurisdiction—(a) of organizations or groups pretending to be the Government for any part of the territories of the other Party, or (b) of alien subjects or citizens who may be found to be actually carrying on political activities for such organizations or groups.

ARTICLE VI In the interest of promoting economic relations between the two countries, and taking into consideration the needs of Japan with regard to natural resources, the Government of the Union of Soviet Socialist Republics is willing to grant to Japanese subjects, companies and associations concessions for the exploitation of minerals, forest and other natural resources in all the territories of the Union of Soviet Socialist Republics.

ARTICLE VII The present Convention shall be ratified.

Such ratification by each of the High Contracting Parties shall, with as little

Digitized by Google

delay as possible, be communicated, through its diplomatic representative at Peking, to the Government of the other Party, and from the date of the letter of such communications this Convention shall come into full force.

CONVENTION DE COMMERCE ET DE NAVIGATION ENTRE LE JAPON ET LA FRANCE

Signé à Paris, le 19 août, 1911

ARTICLE PREMIER

Les ressortissants de chacune des Hautes Parties Contractantes auront pleine liberté, avec leurs familles, d'entrer et de séjourner dans toute l'étendue des territoires de l'autre. Sous la condition de se conformer aux lois du pays, ils jouiront des droits ci-après spécifiés :

1 Ils seront, en ce qui concerne le voyage et la résidence, traités sous tous rapports comme les nationaux ;

2 Ils auront, comme les nationaux, le droit de se livrer au commerce ou à l'industrie manufacturière et de faire le trafic de tous articles de commerce licite, soit en personne, soit par des représentants, soit seuls, soit en association avec des étrangers on des nationaux ;

3 Ils seront, en ce qui concerne l'exercice de leur industrie, métier ou profession, la poursuite de leurs études ou investigations scientifiques, traités à tous égards, comme les ressortissants de la nation la plus favorisée ;

4 Ils pourront posséder ou louer et occuper les maisons, les manufactures, les magasins, les boutiques et les locaux qui peuvent leur être nécessaires et prendre à bail des terrains à l'effet d'y résider ou de les utiliser dans un but licite commercial, industriel, manufacturier ou autre ;

5 Ils pourront, sous la condition de la réciprocité, librement acquérir et posséder toute espèce de propriété mobilière ou immobilière, que la loi du pays permet ou permettra d'acquérir ou de posséder aux ressortissants de tout autre pays étranger.

Ils pourront en disposer par voie de vente, échange, donation, mariage, testament, ou de toute autre manière sous les mêmes conditions qui sont ou seront établies à l'égard des nationaux eux-mêmes. Ils pourront aussi exporter librement le produit des ventes de leurs propriétés et tout ce qui leur appartient en général, sans pouvoir être soumis en tant qu'étrangers, à des droits autres ou plus élevés que ceux auxquels seraient soumis les nationaux dans les mêmes circonstances :

6 Ils jouiront d'une protection et sécurité constantes et complètes, pour leurs personnes et leurs propriétés ; ils auront un accès libre et facile auprès des cours et tribunaux de justice pour la poursuite et la défense de leurs droits, et ils seront, en outre, comme les nationaux eux-mêmes, libres de choisir et d'employer des avocats, avoués et autres hommes de loi pour les représenter devant les cours et tribunaux, et d'une manière générale ils auront les mêmes droits et privilèges que les nationaux pour tout ce qui concerne l'administration de la justice ;

7 Ils seront exempts de tout service militaire obligatoire, soit dans l'armée de terre ou de mer, soit dans la garde nationale ou la milice, ainsi que de toutes les contributions imposées en lieu et place du service personnel. Ils seront exempts également de tous emprunts forcés et de toutes réquisitions ou contributions militaires, sauf ceux qui leur seront imposés, comme aux nationaux eux-mêmes, en leur qualité de possesseurs, locataires ou occupants de biens immeubles. Pour ce qui précède, les ressortissants de chacune des Hautes Parties Contractantes ne seront pas traités sur les territoires de l'autre moins bien que ne le sont ou ne le seront les ressortissants de la nation la plus favorisée ;

8 Ils ne seront contraints à subir des charges ou à payer des impôts, taxes ou contributions, de quelque nature que

Digitized by Google

ce soit, autres ou plus élevés que ceux qui sont ou pourront être imposés aux nationaux ou ressortissants de la nation la plus favorisée.

ARTICLE 2

Les habitations, magasins, manufactures et boutiques des ressortissants de chacune des Hautes Parties Contractantes dans les territoires de l'autre, ainsi que tous les locaux qui en dépendent, employés pour des buts licites, seront respectés. Il ne sera point permis d'y procéder à des visites domiciliaires ou perquisitions, non plus que d'examiner ou d'inspecter les livres, papiers ou comptes, sauf dans les conditions et formes prescrites par les lois à l'égard des nationaux eux-mêmes.

ARTICLE 3

Les ressortissants des Parties Contractantes jouiront de la liberté réciproque de commerce, et de navigation ; ils auront, de la même façon que les ressortissants de la nation la plus favorisée, pleine liberté de se rendre avec leurs navires et leurs cargaisons dans les lieux, ports et rivières des territoires de l'autre, qui sont ou pourront être ouverts au commerce extérieur ; ils bénéficieront, en se conformant toujours aux lois du pays où ils arrivent, des mêmes droits, faveurs, libertés, immunités et exemptions en matière de commerce et de navigation, dont bénéficient ou bénéficieraient les nationaux eux-mêmes.

ARTICLE 4.

Les sociétés anonymes ou autres et les associations commerciales, industrielles et financières qui sont ou seront constituées conformément aux lois de l'une des Parties Contractantes et qui ont leur domicile dans les territoires de cette Partie, sont autorisées, dans les territoires de l'autre, en se conformant aux lois de celle-ci, à exercer leurs droits et à ester en justice devant les tribunaux, soit pour intenter une action, soit pour y défendre.

ARTICLE 5

Les droits de douane perçus à l'entrée au Japon et en France sur les produits de l'autre pays ne pourront être autres ou plus élevés que ceux imposés aux produits similaires originaires du pays le plus favorisé.

Les droits perçus à la sortie du Japon et de France sur les produits destinés à l'autre pays ne pourront également être autres ou plus élevés que ceux imposés aux mêmes produits destinés au pays le plus favorisé.

ARTICLE 6.

Les Parties Contractantes s'engagent à n'entraver nullement le commerce réciproque des deux pays par des prohibitions ou restrictions à l'importation, à l'exportation ou au transit.

Des exceptions à cette règle, en tant qu'elles seront applicables à tous les pays ou aux pays se trouvant dans les mêmes conditions, ne pourront avoir lieu que dans les cas suivants :

1 Pour les approvisionnements et munitions de guerre, dans des circonstances extraordinaires ;

2 Pour des raisons de sûreté publique ;

3 Par égard à la police sanitaire ou en vue de la protection des animaux ou des plantes utiles contre les maladies ou les insectes et parasites nuisibles ;

4 En vue de l'application aux marchandises étrangères des prohibitions ou restrictions édictées par des lois intérieures à l'égard de la production intérieure des marchandises similaires ou de la vente ou du transport à l'intérieur des marchandises similaires de la production nationale ;

5 Pour les marchandises qui sont ou seront l'objet d'un monopole d'Etat.

ARTICLE 7

Les marchandises de toute nature originaires du territoire de l'une des deux Parties Contractantes et importées sur le territoire de l'autre Partie ne pourront être assujetties à des droits d'accise, d'octroi ou de consommation perçus pour le compte de l'Etat, des communes ou corporations, supérieurs à ceux qui grèvent ou grèveraient les produits similaires de la production nationale ou, à défaut de ces produits, ceux de la nation la plus favorisée.

Les produits du sol et de l'industrie de l'un des deux pays importés dans le territoires de l'autre, et destinés à l'entreposage ou au transit, ne seront soumis à aucun droit intérieur.

Digitized by Google

ARTICLE 8

Les importateurs de marchandises japonaises ou françaises seront réciproquement dispensés de l'obligation de produire des certificats d'origine.

Toutefois, dans le cas où un pays tiers ne serait pas lié avec l'une ou l'autre des Parties Contractantes par la clause de la nation la plus favorisée, la production de certificats d'origine pourra être exceptionnellement exigée.

Dans ce cas, les certificats seront délivrés dans les lieux d'expédition, sièges d'un consulat, par le consul de carrière du pays dans lequel l'importation doit être faite, et, dans les autres lieux, par l'autorité douanière, et, à défaut de cette autorité, par les Chambres de commerce ou les autorités locales.

Lorsque la délivrance des certificats d'origine entraînera la perception de taxes quelconques dans l'un des pays, des taxes équivalentes pourront être établies par l'autre pays à l'occasion des certificats d'origine qu'il délivrera. Il en sera de même, le cas échéant, pour les factures consulaires.

ARTICLE 9

Les négociants et les industriels, ressortissants de l'une des Parties Contractantes, ainsi que les négociants et les industriels domiciliés et exerçant leur commerce et industrie dans les territoires de cette Partie, pourront, dans les territoires de l'autre, soit en personne, soit par des commis voyageurs, faire des achats ou recueillir des commandes, avec ou sans échantillons et modèles. Ces négociants, industriels et leurs commis voyageurs, en faisant ainsi des achats et en recueillant des commandes, jouiront, en toute manière, du traitement de la nation la plus favorisée. Toutefois dans le cas où les voyageurs de commerce japonais en France ou francais au Japon viendraient à être assujettis à un droit de patente, les voyageurs de commerce français au Japon ou japonais en France pourront être soumis à des impôts équivalents.

Les articles importés comme échantillons et modèles dans les buts susmentionnés, seront, dans chacun des deux Pays, admis temporairement en franchise de droits, en conformité des règlements et formalités de douane établis pour assurer leur réexportation ou le payment des droits de douane prescrits en cas de nonréexportation dans le délai prévu par la loi. Toutefois, ledit privilège ne s'étendra pas aux articles qui, à cause de leur quantité ou valeur, ne peuvent pas être considérés comme échantillons et modèles ou qui, à cause de leur nature, ne sauraient être identifiés lors de leur réexportation. Le droit de décider si un échantillon ou modèle est susceptible d'admission en franchise, appartient exclusivement, dans tous les cas, aux autorités douanières compétentes du lieu où l'importation a été effectuée.

Les Chambres de commerce existant sur les territoires des deux Parties Contractantes seront réciproquement reconnues comme les autorités compétentes pour délivrer tous certificats qui pourraient être requis par les voyageurs de commerce, en vue notamment d'affirmer leur identité.

ARTICLE 10

Tous les articles qui sont où pourront être légalement importés dans les ports de l'une des Parties Contractantes, par des navires nationaux, pourront de même, être importés dans ces ports par des navires de l'autre Partie Contractante, sans être soumis à aucun droit ou charge, de quelque dénomination que ce soit, autres où plus élevés que ceux auxquels les mêmes articles seraient soumis s'ils étaient importés par des navires nationaux. Cette égalité réciproque de traitement sera appliquée sans distinction, que ces articles viennent directement du lieu d'origine où de tout autre pays étranger.

Il y aura de même parfaite égalité de traitement pour l'exportation, de façon que les mêmes droits de sortie seront payés et les mêmes primes où drawbacks seront accordés, dans les territoires de chacune des Parties Contractantes, à l'exportation d'un article quelconque qui peut où pourra en être légalement exporté, que cette exportation se fasse par des navires japonais où par des navires français et quel que soit le lieu de destination, soit un port de l'autre Partie, soit un port d'une tierce Puissance.

Digitized by Google

ARTICLE 11

En tout ce qui concerne le placement des navires, leur chargement, leur déchargement dans les eaux territoriales des Parties Contractantes, il ne sera accordé, par l'une des Parties, aux navires nationaux, aucun privilège, ni aucune facilité qui ne le soit également, en pareil cas, aux navires de l'autre Pays, la volonté des Parties Contractantes étant que, sous ces rapports, leurs bâtiments respectifs jouissent d'une parfaite égalité.

ARTICLE 12

Les navires marchands naviguant sous pavillon japonais et français et ayant à bord les documents requis par leurs lois nationales pour établir leur nationalité, seront respectivement considérés, en France et au Japon, comme navires japonais et français.

ARTICLE 13

Aucun droit de tonnage, de transit, de canal, de port, de pilotage, de phare, de quarantaine ou autres droits ou charges similaires ou analogues, de quelque dénomination que ce soit, levés-au nom ou au profit du gouvernement, de fonctionnaires publics, de particuliers, de corporations ou d'établissements quelconques, ne seront imposés dans les eaux territoriales de l'un des deux Pays sur les navires de l'autre sans qu'ils soient également imposés, dans les mêmes conditions, sur les navires nationaux en général, ou sur les navires de la nation la plus favorisée. Cette égalité de traitement sera appliquée réciproquement à leurs navires respectifs, de quelque endroit qu'ils arrivent et quel que soit le lieu de destination.

ARTICLE 14.

Les navires chargés d'un service postal régulier de l'une des Parties Contractantes, qu'ils appartiennent à l'État ou à une compagnie subventionnée par lui à cet effet, jouiront dans les eaux territoriales de l'autre, des mêmes facilités, privilèges et immunités que ceux qui sont accordés aux navires similaires de la nation la plus favorisée.

ARTICLE 15

Il est fait exception aux dispositions de la présente Convention pour le cabotage dont le régime reste soumis à la législation du Japon et de la France respectivement; il est entendu toutefois, que les Japonais en France et les Français au Japon, jouiront pour tout ce qui concerne le cabotage, des droits et privilèges qui sont ou seront accordés par cette même législation aux ressortissants de la nation la plus favorisée.

Tout navire de l'une des Parties Contractantes, chargé à l'étranger d'une cargaison destinée à deux ou plusieurs ports d'entrée des territoires de l'autre, pourra décharger une partie de sa cargaison dans l'un desdits ports, et en continuant son voyage pour l'autre ou les autres ports de destination, y décharger le reste de sa cargaison, toujours en se conformant aux lois, aux tarifs et aux règlements de douane du pays de destination. De la même manière et sous la même restriction, tout navire de l'une des Parties Contractantes pourra charger dans les divers ports de l'autre, au cours du même voyage pour l'étranger.

ARTICLE 16

Les deux Hautes Parties Contractantes déclarent qu'elles sont adhérentes à la Convention d'Union de Paris du 20 mars 1883 pour la protection de la propriété industrielle; dans le cas où l'une d'entre elles cesserait d'adhérer à la Convention précitée, elles conviennent des stipulations suivantes:

Les ressortissants de chacune des Parties Contractantes jouiront, dans les territoires de l'autre Partie, des mêmes droits que les nationaux eux-mêmes, pour tout ce qui concerne la protection des brevets d'invention, des marques de fabrique ou de commerce, des dessins et modèles industriels et de fabrication de toute espèce, et noms commerciaux, et des indications de provenance, et pour tout ce qui concerne la répression de la concurrence déloyale, sous réserve de l'accomplissement des formalités et des conditions imposées par la loi.

Tout produit portant une fausse indication de provenance dans laquelle un des Pays Contractants, ou un lieu situé sur les territoires de l'un d'eux, serait directement ou indirectement indiqué comme pays ou comme lieu d'origine, sera saisi à l'importation à la requête

Digitized by Google

des autorités douanières ou ministère public où d'une partie intéresée, si la législation de chaque Pays Contractant l'admet, où bien, à défaut, sera soumis aux actions et moyens assurés en pareil cas par la loi aux nationaux.

ARTICLE 17

Les Hautes Parties Contractantes conviennent que, pour tout ce qui concerne le commerce, l'industrie et la navigation, tout privilège, faveur ou immunité quelconque, que l'une d'elles a déjà accordés ou accorderait à l'avenir au commerce, à l'industrie et à la navigation de tout autre État, seront étendus immédiatement et sans condition, au commerce, à l'industrie et à la navigation de l'autre Partie Contractante, leur intention étant que le commerce, l'industrie et la navigation de chaque pays jouissent sous tous rapports du traitement de la nation la plus favorisée.

ARTICLE 18

Les stipulations de la présente Convention ne sont pas applicables :

1 Aux avantages particuliers actuellement accordés ou qui pourraient être ultérieurement accordés par l'une des Parties Contractantes à des États limitrophes pour faciliter le trafic frontière;

2 Aux faveurs spéciales résultant d'une union douanière ;

3 Aux pêches assimilées à la pêche nationale ;

4 Aux encouragements accordés ou qui pourraient être accordés à la marine marchande nationale.

ARTICLE 19

Les dispositions de la présente Convention sont applicables à l'Algérie. Elles pourront être ultérieurement étendues en tout ou partie aux colonies, possessions françaises et pays de protectorat par une déclaration concertée entre les deux gouvernments.

Il est entendu en outre que la présente Convention est applicable à toutes les colonies et possessions du Japon.

ARTICLE 20

La présente Convention sera ratifiée et l'échange des ratifications aura lieu à Tokyo ; les ratifications seront notifiées dans le plus bref délai possible aux Gouvernements du Japon et de la France par leurs Représentants respectifs ; à partir de la date de la dernière de ces deux notifications, la présente Convention entrera en vigueur et demeurera exécutoire pendant une période de dix années.

Toutefois, l'article 5 en vertu duquel les droits de douane perçus en France sur les produits d'origine japonaise et au Japon sur les produits d'origine française ne seront autres ou plus élevés que ceux perçus sur les produits similaires originaires du pays le plus favorisé, pourra être dénoncé à toute époque par chacune des deux Parties Contractantes, et dans ce cas, il cessera d'être exécutoire un an après cette dénonciation.

Au cas où douze mois avant la date d'expiration de la présente Convention aucune des deux Parties Contractantes n'aurait notifié son intention d'en faire cesser les effets, cet acte demeurera obligatoire jusqu'à l'expiration d'une année à partir du jour où l'une ou l'autre Partie Contractante l'aura dénoncé.

TRAITÉ DE COMMERCE ET DE NAVIGATION ENTER LE JAPON ET L'ALLEMAGNE

Signé à Berlin, le 24 Juin, 1911

ARTICLE 1

Les ressortissants de chacune des Hautes Parties Contractantes auront pleine liberté d'entrer et de séjourner en tout lieu des territoires de l'autre.

A condition de se conformer aux lois du Pays, ils jouiront des droits spécifiés ci-dessous :

1 Ils seront, pour tout ce qui concerne la résidence, les études et investigations, l'exercice de leurs métiers et professions et l'exécution de leurs entreprises industrielles et manufac-

Digitized by Google

turières, placés, à tous égards, sur le même pied que les ressortissants de la nation la plus favorisée ;

2 Ils auront, comme les nationaux eux-mêmes, le droit de voyager dans toute l'étendue des territoires de l'autre et le droit de faire le trafic de tous articles de commerce licite ;

3 Ils pourront posséder ou louer et occuper des maisons, fabriques, magasins, boutiques et les locaux qui en dépendent. De même ils pourront louer des terrains à l'effet d'y résider ou de les utiliser dans un but licite commercial, industriel, manufacturier ou autre ;

4 En ce qui concerne la possession de biens mobiliers de quelque espèce que ce soit, la transmission, par succession testamentaire ou autre, des biens mobiliers de toute sorte qu'ils peuvent légalement acquérir entre vivants et en ce qui concerne le droit de disposer, de quelque manière que ce soit, des biens de toute sorte qu'ils auront acquis légalement, ils jouiront des mêmes privilèges, libertés et droits et ne seront soumis, sous ce rapport, à aucuns impôts ou charges plus élevés que les nationaux ou les ressortissants de la nation la plus favorisée ;

5 Ils pourront, sons la réserve de la réciprocité, acquérir et posséder toute sorte d'immeubles qui, d'après les lois du Pays, peuvent ou pourront être acquis ou possédés par les ressortissants d'une autre nation étrangère quelconque, en se conformant toujours aux conditions et restrictions prescrites par lesdites lois ;

6 Ils seront exempts de tout service militaire obligatoire, soit dans l'armée ou la marine, la garde nationale ou la milice, de même que de toutes taxes imposées en lieu et place du service personnel et de tous emprunts forcés. Ils ne pourront être assujettis à des réquisitions ou contributions militaires, quelles qu'elles soient, autrement que dans les mêmes conditions et sur le même pied que les nationaux ou les ressortissants de la nation la plus favorisée ;

7 Ils ne seront contraints, sous aucun prétexte, à subir des charges on à payer des taxes autres ou plus élevées que celles qui sont ou seront imposées aux nationaux ou aux ressortissants de la nation la plus favorisée.

ARTICLE 2

Les habitations, magasins, fabriques et boutiques des ressortissants de chacune des Hautes Parties Contractantes dans les territoires de l'autre ainsi que tous les locaux qui en dépendent, seront respectés. Il ne sera point permis d'y procéder à des visites domiciliaires ou perquisitions ou d'examiner ou d'inspecter les livres, papiers ou comptes, sauf dans les conditions et formes prescrites par les lois à l'égard des nationaux.

ARTICLE 3

Il y aura entre les territoires des deux Hautes Parties Contractantes liberté réciproque de commerce et de navigation.

Les ressortissants de chacune des Hautes Parties Contractantes auront pleine liberté de se rendre avec leurs navires et leurs cargaisons dans les lieux, ports et rivières des territoires de l'autre qui sont ou pourront être ouverts au commerce extérieur ; ils sont, toutefois, tenus de se conformer toujours aux lois du Pays où ils arrivent.

ARTICLE 4

Les droits de douane perçus sur les articles, produits naturels ou fabriqués des territoires de l'une des Hautes Parties Contractantes, à leur importation dans les territoires de l'autre, seront réglés, soit par des arrangements spéciaux entre les deux Pays, soit par la législation intérieure de chacun d'eux.

Aucune des Parties Contractantes n'imposera à l'exportation d'un article quelconque à destination des territoires de l'autre des droits ou charges quelconques autres ou plus élevés que ceux qui sont ou pourront être imposés à l'exportation des articles similaires à destination de tout autre pays étranger.

ARTICLE 5

Les Hautes Parties Contractantes s'engagent à n'entraver leurs relations commerciales réciproques par aucune prohibition d'importation, d'exportation ni de transit.

Des exception pourront toutefois être faites dans les cas suivants, en tant qu'elles sont appliquées à tous les autres pays on du moins à tous les pays

Digitized by Google

qui se trouvent dans les mêmes conditions :

1 Relativement aux approvisionnements de guerre, dans des circonstances exceptionnelles ;

2 Pour des considérations affectant la sécurité publique ;

3 Pour cause de salubrité publique et en vue d'assurer la protection des animaux et des plantes utiles contre les maladies et les parasites ;

4 Dans le but d'appliquer à des marchandises étrangères des interdictions ou des restrictions établies par la législation intérieure à l'égard de la production, du placement ou du trafic de marchandises indigènes de même nature.

ARTICLE 6

Les ressortissants de chacune des Hautes Parties Contractantes jouiront, dans les territoires de l'autre, d'une parfaite égalité de traitement avec les nationaux, quant à l'exemption de droits de transit et pour tout ce qui concerne le magasinage, les primes, les drawbacks ains que les facilités touchant l'importation ou l'exportation des marchandises.

ARTICLE 7

Les négociants et les industriels que, par l'exhibition d'une carte de légitimation industrielle, délivrée par les autorités de l'une des Parties Contractantes, prouvent qu'ils sont autorisés à exercer leur commerce ou industrie dans les territoires de cette Partie, pourront, dans les territoires de l'autre, soit en personne, soit par des commis voyageurs, faire des achats ou recueillir des commandes, avec ou sans échantillons. Ces négociants, industriels et leurs commis voyageurs, en faisant ainsi des achats et en recueillant des commandes, jouiront, en matière d'impositions et de facilités, du traitement de la nation la plus favorisée.

Les Parties Contractantes se donneront réciproquement connaissance des autorités chargées de délivrer les cartes de légitimation.

Les articles importés comme échantillons dans les buts mentionnés dans l'alinéa 1 seront, dans chacun des deux Pays, admis temporairement en franchise de droit, en conformité des règlements et formalités de douane, établis pour assurer leur réexportation ou le payement des droits de douane prescrits en cas de non-réexportation dans le délai prévu par la loi. Toutefois, ledit privilège ne s'étendra pas aux articles qui, à cause de leur quantité ou valeur, ne peuvent pas être considérés comme échantillons, ou qui, à cause de leur nature, ne sauraient être identifiés lors de leur réexportation. Le droit de décider si un échantillon est susceptible d'admission en franchise, appartient exclusivement dans tous les cas, aux autorités compétentes du lieu ou l'importation a été effectuée.

ARTICLE 8

Les marques de reconnaissance, estampilles ou cachets apposés au moment de l'exportation par les autorités douanières de l'une des Parties Contractantes aux échantillons mentionnés dans l'article précédent ainsi que la liste de ces échantillons qui est officiellement attestée par elles et en contient la description détaillée, seront réciproquement acceptés par les autorités douanières de l'autre pour établir leur caractère d'échantillons et leur assurer l'exemption de toute inspection, sauf en tant que cette dernière est nécessaire pour constater que les échantillons présentés sont identiques avec ceux énumérés dans la liste. Les autorités douanières de chacune des Parties Contractantes pourront toutefois apposer une marque supplémentaire aux échantillons dans les cas spéciaux où elles jugent nécessaire de prendre cette précaution.

ARTICLE 9

Les sociétés par actions (anonymes) et autres sociétés et associations commerciales, industrielles ou financières, y compris les compagnies d'assurance, domiciliées dans les territoires de l'une des Parties Contractantes et ayant l'existence légale d'après les lois qui y sont en vigueur, seront reconnues comme ayant l'existence légale dans les territoires de l'autre et autorisées à y ester en justice devant les tribunaux, soit pour intenter une action, soit pour y défendre d'après les lois de cette autre Partie.

Leur admission à l'exercice de leur industrie ou de leur commerce ainsi

Digitized by Google

qu'à l'acquisition de biens dans les territoires de l'autre Partie se règle d'après les prescriptions qui y sont en vigueur. En tout cas, lesdites sociétés, associations et compagnies jouiront, dans ces territoires, des mêmes droits que ceux qui sont ou pourront être accordés à des sociétés, associations et compagnies similaires de la nation la plus favorisée.

ARTICLE 10

Tous les articles qui sont on pourront être légalement importés, dans les ports de l'une des Hautes Parties Contractantes, par des navires nationaux, pourront, de même, être importés dans ces ports par des navires de l'autre Partie Contractante, sans être soumis à aucuns droits ou charges, de quelque dénomination que ce soit, autres ou plus élevés que ceux auxquels les mêmes articles seraient soumis s'ils étaient importés par des navires nationaux. Cette égalité réciproque de traitement sera appliquée sans distinction, que ces articles viennent directement du lieu d'origine, ou de tout autre pays étranger.

Il y aura, de même, parfaite égalité de traitement pour l'exportation, de façon que les mêmes droits de sortie seront payés, et les mêmes primes et drawbacks seront accordés, dans les territoires de chacune des Parties Contractantes, à l'exportation d'un article quelconque qui peut ou pourra en être légalement exporté, que cette exportation se fasse par des navires japonais ou par des navires allemands et quel que soit le lieu de destination, soit un port de l'autre Partie, soit un port d'une tierce Puissance.

ARTICLE 11

En tout ce qui concerne le placement des navires, leur chargement, leur déchargement, dans les eaux territoriales des Hautes Parties Contractantes, il ne sera accordé par l'une des Parties aux navires nationaux aucun privilège ni aucune facilité qui ne le soit également, en pareils cas, aux navires de l'autre Pays, la volonté des Parties Contractantes étant que, sous ces rapports, les bâtiments respectifs soient traités sur le pied d'une parfaite égalité.

ARTICLE 12

Tous les navires qui, conformément aux lois allemandes, sont considérés comme navires allemands et tous les navires qui, conformément aux lois japonaises, sont considérés comme navires japonais seront considérés respectivement en tout ce qui concerne l'application de ce Traité comme navires allemands et japonais.

ARTICLE 13

Aucuns droits de tonnage, de transit, de canal, de port, de pilotage, de phare, de quarantaine ou autres droits ou charges similaires ou analogues, de quelque dénomination que ce soit, levés au nom ou au profit du Gouvernment, de fonctionnaires publics, de particuliers, de corporations ou d'établissements quelconques, ne seront imposés dans les eaux territoriales de l'un des deux Pays aux navires de l'autre, sans qu'ils soient également imposés, sous les mêmes conditions, aux navires nationaux en général ou aux navires de la nation la plus favorisée. Cette égalité de traitement sera appliquée réciproquement aux navires respectifs, de quelque endroit qu'ils arrivent et quel que soit le lieu de destination.

ARTICLE 14

Les navires chargés d'un service postal régulier de l'une des Haute Parties Contractantes jouiront, dans les eaux territoriales de l'autre, des mêmes facilités, privilèges et immunités que ceux qui sont accordées aux navires similaires de la nation la plus favorisée.

ARTICLE 15

Les cabotage est excepté des dispositions du présent Traité et reste réservé au pavillon national. Il est toutefois entendu que, sous ce rapport, chacune des deux Parties peut réclamer pour ses navires les mêmes droits ou privilèges qui sont ou seront accordés par l'autre Partie aux navires de tout autre pays en tant qu'elle accorde aux navires de l'autre Partie les mêmes droits ou privilèges.

Ne sera pas considéré comme cabotage :

1. Le trafic des navires passant d'un port dans un autre, soit pour y débarquer des passagers ou décharger tout ou partie de leur cargaison apportés de l'étranger, soit pour y em-

Digitized by Google

barquer des passagers ou charger tout ou partie de leur cargaison à destination étrangère,

2. Le transport, d'un port à l'autre, de passagers munis de billets directs, ou de marchandises expédiées avec connaissements directs délivrés à ou destinés pour l'étranger.

ARTICLE 16

En cas de naufrage, avaries en mer ou relâche forcée, chacune des Hautes Parties Contractantes devra donner aux navires de l'autre, qu'ils appartiennent à l'État ou à des particuliers, la même assistance et protection et les mêmes immunités que celles qui seront accordées en pareils cas aux navires nationaux. Les articles sauvés de ces vaisseaux naufragés ou avariés seront exempts de tous droits de douane, à moins qu'ils n'entrent dans la consommation intérieure, auquel cas ils seront tenus de payer les droits prescrits.

Les autorités locales devront, dès que faire se pourra, informer du naufrage ou des avaries le plus proche Consul de l'État du pavillon. Les Consuls des Pays Contractants sont autorisés à prêter l'aide nécessaire à leurs nationaux.

ARTICLE 17

Réserve faite des cas où ce Traité en dispose autrement d'une manière expresse, les Hautes Parties Contractantes conviennent qu'en tout ce qui concerne le commerce, la navigation et l'industrie toutes sortes de privilèges, faveurs ou immunités que l'une ou l'autre des Parties Contractantes a déjà accordés ou accordera à l'avenir aux navires ou aux ressortissants de tout autre État, seront tention étant que, sauf les cas exception aux navires ou aux ressortissants de l'autre Partie Contractante, leur intention étant que, sauf les cas exceptionnels précités, le commerce, la navigation et l'industrie de chaque Pays soient placés, à tous égards, par l'autre sur le pied de la nation la plus favorisée.

ARTICLE 18

Les dispositions du présent Traité s'appliquent de même aux pays et territoires qui appartiennent à présent ou appartiendront à l'avenir au territoire douanier de l'une ou l'autre des Parties Contractantes.

ARTICLE 19.

Le présent Traité entrera en vigueur le 17 juillet 1911 avec la Convention speciale et réciproque de Douane, signée en date de ce jour. Il restera obligatoire jusqu'au 16 juillet 1923.

Dans le cas où aucune des Parties Contractantes n'aurait notifié douze mois avant l'échéance de ce dernier terme, son intention de faire cesser les effets du Traité, celui-ci continuera à être exécutoire jusqu'à l'expiration d'une année à partir du jour où l'une ou l'autre des Parties Contractantes l'aura dénoncé.

Les Parties Contractantes se réservent cependant la faculté de dénoncer, jusqu'au 31 mars 1912, le présent Traité. Ledit Traité cessera dans ce cas ses effets le 31 décembre 1912. Il est entendu que les Parties Contractantes ne feront pas usage de la faculté mentionnée sans dénoncer simultanément la Convention de Douane citée dans l'alinéa I du présent article.

ARTICLE 20

Le présent Traité sera ratifié et les ratifications en seront echangées à Tokio, aussitôt que faire se pourra.

SUMMARY OF TRADE AGREEMENT BETWEEN JAPAN AND INDIA,

January, 1934

1. Most favoured nation treatment: In respect of customs duties, Japan and India shall reciprocally accord the most favoured nation treatment to any articles, produce or manufacture of the other country.

2. Negotiations to be held concerning modification of customs tariff: Subject to reservation by both countries of the right to make such changes in their customs tariffs as may be necessary for the protection of their own interests,

Digitized by Google

Japan and India agree that, should any modification of customs tariffs by either country result in trade interests being adversely affected in any appreciable measure, they shall upon request of the country so affected enter into negotiations with the object of reconciling so far as possible trade interests of the two countries.

8. Measures to correct effects of exchange fluctuation: Nothing in this agreement shall be held to prohibit the imposition or the variation from time to time by the Government of India of special rates of customs duty on articles, the produce or manufacture of Japan, other or higher than those levied on similar articles produced or manufactured by any other country, at such rates as the Government of India may consider to be necessary to correct the effects of any variation of the exchange value of the yen relative to the rupee subsequent to December 31, 1933.

Imposing or varying, or on being requested by the Government of Japan to vary, such special rates of customs duty, the Government of India undertakes to give full consideration to relevant factors which tend to raise the export prices of Japanese goods, such as the purchase by Japan of raw materials in markets outside Japan and the adjustment of internal Japanese prices, and to limit such rates to what is necessary to correct the effect of the depreciation of the exchange value of the yen relative to the rupee on the duty-paid value of Japanese goods imported into India. Provided, that no charge in such rate shall be made until it has been in force for at least five weeks.

Reciprocally, the Government of Japan shall have the right of imposing or varying special rates of customs similar to those for which provision is made in paragraph 1 of this article (3), on articles, the produce or manufacture of India, under similar circumstances, and subject to conditions similar to those provided for in paragraphs 2 and 3 of this article (3). Provided, that the said right shall not accrue to the Government of Japan unless the exchange value of the rupee relative to the yen shall be depreciated below the value of .732 yen.

4. Customs duties on Japanese cotton piece-goods imported into India: Without prejudice to agreements concerning the most favoured nation treatment, and the measures to correct the effects of exchange fluctuation, customs duties to be imposed by the Government of India on Japanese cotton piece-goods should not exceed the following rates:

Duty on plain greys.....50 per cent. ad. valorem or 5.25 annas per pound.

Duty on others.....50 per cent. ad. valorem.

It is understood that the Government of India shall not impose on Japanese cotton piece-goods other than plain greys a specific duty exceeding 5.25 annas per pound subject to agreement concerning the most favoured nation treatment.

5. Importation of Japanese cotton piece-goods into India:

(a) Calculation of the quota of Japanese cotton piece-goods to be exported to India in a period of one year beginning April 1 shall be fixed in accordance with quantity of Indian raw cotton exported to Japan in a period of one year beginning January 1 of the same year.

(b) It is to be noted that the period of one year for the purpose of fixing the quota of Japanese cotton piece-goods (or piece-goods year) shall be from April 1 to March 31 of the following year, while the period of one year for the purpose of calculating the quantity of Indian raw cotton to be exported to Japan (or cotton year) shall be from January 1 to December 31.

6. Basic quota and its modification: The basic quota of Japanese cotton piece-goods to be exported to India in a piece-goods year shall be 325,000,000 yards and it shall be linked with 1,000,000 bales of Indian raw cotton exported to Japan in the corresponding cotton year.

(a) In case the export of Indian raw cotton to Japan in any cotton year should fall below the 1,000,000 bales quota, the Japanese cotton piece-goods for the corresponding piece-goods year shall be determined by reducing the above basic quota at the rate of 2,000,000 yards for every 10,000 bales of deficit.

(b) In case, however, such export in any cotton year should exceed the 1,000,000 bales quota, the Japanese cotton piece-goods for the corresponding piece-goods year shall be determined by increasing the above basic quota at the

Digitized by Google

rate of 1,500,000 yards for every additional 10,000 bales, provided that quota should in no case exceed 400,000,000 yards.

(c) In case the export of Indian raw cotton to Japan in any cotton year should exceed 1,500,000 bales, the quantity thus exported in excess of 1,500,000 bales shall be for the purpose of determining the relevant quota of Japanese cotton piece-goods added to the quantity of raw cotton exported to Japan in the following cotton year.

(d) In respect of both cotton piece-goods and raw cotton re-exported the quantity shall be deducted from imported quantity.

(e) The year shall be divided into two half-yearly periods, the first half-yearly period running from April 1 to September 30 and the second half-yearly period from October 1 to March 31 of the following year.

(f) The quota for the second half-yearly period shall be provisionally fixed at the quantity which will be derived by deducting 200,000,000 yards from the yearly quota, calculated on the basis of estimated export of Indian raw cotton to Japan in the corresponding cotton year.

7. Adjustment: The adjustment of export of Japanese cotton piece-goods to India shall be made by the end of the said period on basis of exact quantity of Indian raw cotton exported to Japan in the corresponding cotton year, subject to rules of allowances between periods.

A transfer from the quota of the first half-yearly period to the quota of the second half-yearly period shall be permitted up to a maximum of 20,000,000 yards.

From the second half-yearly period to the first half-yearly period of the succeeding piece-goods year and vice versa, transfer up to a maximum of 20,000,000 yards shall be permitted.

8. Classification of quota into categories:

The quota of cotton piece-goods shall be classified into the following categories in conformity with the following percentages:

Plain greys..	45 per cent.
Bordered greys	13 per cent.
Bleached	8 per cent.
Coloured and other ..	34 per cent.

The percentage allotted to each of the above categories may be modified subject to the following conditions:

Increase in category either of bordered greys or bleached shall not exceed 20 per cent. of quantity allotted to that category, and an increase in any other category shall not exceed 10 per cent. of quantity allotted to that category.

9. Transfer: The quantity transferable from category either of bordered greys or bleached shall not exceed 20 per cent. of quantity allotted to that category and the quantity transferable from any other category shall not exceed 10 per cent. of quantity allotted to that category: and

The total quota of cotton piece-goods for any piece-goods year shall not be increased by the above modification of quantity allotted to each category.

10. The quota for the period intervening the enforcement of the arrangement and the commencement of the first piece-goods year:

(a) The quota of cotton piece-goods for the period between the date on which the present Indian customs on cotton piece-goods year begins shall be the proportionate fraction of the quantity that would have been allotted to the whole piece-goods year from April 11, 1933 to March 31, 1934, on the basis of the quantity of Indian raw cotton imported into Japan in the cotton year of 1933 (From January 1 to December 31).

(b) The quota for this period and the first half-yearly instalment of the first piece-goods year quota should be consolidated into one for the period of approximately nine months, ending at the end of September, 1934.

The treaty shall come into force immediately after an exchange of ratifications, and shall remain in force until March 31, 1937.

TREATY BETWEEN THE FIVE POWERS CONCERNING THE LIMITATION OF NAVAL ARMAMENT

Signed at Washington, February 6, 1922

CHAPTER I

General Provisions Relating to the Limitation of Naval Armament.

ARTICLE I The Contracting Powers agree to limit their respective naval armaments as provided in the present Treaty.

ARTICLE II The Contracting Powers may retain respectively the capital ships which are specified in Chapter II, Part 1. On the coming into force of the present Treaty, but subject to the following provisions of this Article, all other capital ships, built or building, of the United States, the British Empire and Japan shall be dsposed of as prescribed in Chapter II, Part 2.

In addition to the capital ships specified in Chapter II, Part 1, the United States may complete and retain two ships of the West Virginia class now under construction. On the completion of these two ships the North Dakota and Delaware shall be disposed of as prescribed in Chapter II, Part 2.

The British Empire may, in accordance with the replacement table in Chapter II, Part 3, construct two new capital ships not exceeding 35,000 tons (35,560 metric tons) standard displacement each. On the completion of the said two ships the Thunderer, King George V, Ajax and Centurion shall be disposed of as prescribed in Chapter II, Part 2.

ARTICLE III Subject to the provisions of Article II, the Contracting Powers shall abandon their respective capital ship building programmes, and no new capital ships shall be constructed or acquired by any of the Contracting Powers except replacement tonnage which may be constructed or acquired as specified in Chapter II, Part 3.

Ships which are replaced in accordance with Chapter II, Part 3, shall be disposed of as prescribed in Part 2 of that Chapter.

ARTICLE IV The total capital ship replacement tonnage of each of the Contracting Powers shall not exceed in standard displacement, for the United States 525,000 tons(533,400 metric tons); for the British Empire 525,000 tons (533,400 metric tons); for France 175,000 tons (177,800 metric tons); for Italy 175,000 tons (177,800 metric tons); for Japan 315,000 tons (320,010 metric tons).

ARTICLE V No capital ship exceeding 35,000 tons (35,560 metric tons) standard displacement shall be acquired by, or constructed by, for, or within the jurisdiction of, any of the Contracting Powers.

ARTICLE VI No capital ship of any of the Contracting Powers shall carry a gun with a calibre in excess of 16 inches (406 millimetres).

ARTICLE VII The total tonnage for aircraft carriers of each of the Contracting Powers shall not exceed in standard displacement, for the United States 135,000 tons (137,160 metric tons); for the British Empire 135,000 tons (137,160 metric tons); for France 60,000 tons (60,960 metric tons); for Italy 60,000 tons (60,960 metric tons); for Japan 81,000 tons (82,296 metric tons).

ARTICLE VIII The replacement of aircraft shall be effected only as prescribed in Chapter II, Part 3, provided, however, that all aircraft carrier tonnage in existence or building on November 12, 1921, shall be considered experimental, and may be replaced, within the total tonnage limit prescribed in Article VII, without regard to its age.

ARTICLE IX No aircraft carrier exceeding 27,000 tons (27,432 metric tons) standard displacement shall be acquired by, or constructed by, for, or within the jurisdiction of, any of the Contracting Powers.

Digitized by Google

However, any of the Contracting Powers may, provided that its total tonnage allowance of aircraft carriers is not thereby exceeded, build not more than two aircraft carriers, each of a tonnage of not more than 33,000 tons (33,528 metric tons) standard displacement, and in order to effect economy any of the Contracting Powers may use for this purpose any two of their ships, whether constructed or in course of construction, which would otherwise be scrapped under the provisions of Article II. The armament of any aircraft carriers exceeding 27,000 tons (27,432 metric tons) standard displacement shall be in accordance with the requirements of Article X, except that the total number of guns to be carried in case any of such guns be of a calibre exceeding 6 inches (152 millimetres), except anti-aircraft guns and guns not exceeding 5 inches (127 millimetres), shall not exceed eight.

ARTICLE X No aircraft carrier of any of the Contracting Powers shall carry a gun with a calibre in excess of 8 inches (203 millimetres). Without prejudice to the provisions of Article IX, if the armament carried includes guns exceeding 6 inches (152 millimetres) in calibre the total number of guns carried, except anti-aircraft guns and guns not exceeding 5 inches (127 millimetres), shall not exceed ten. If alternatively the armament contains no guns exceeding 6 inches (152 millimetres) in calibre, the number of guns is not limited. In either case the number of anti-aircraft guns and of guns not exceeding 5 inches (127 millimetres) is not limited.

ARTICLE XI No vessel of war exceeding 10,000 tons (10,160 metric tons) standard displacement, other than a capital ship or aircraft carrier, shall be acquired by, or constructed by, for, or within the jurisdiction of, any of the Contracting Powers. Vessels not specifically built as fighting ships nor taken in time of peace under government control for fighting purpose, which are employed on fleet duties or as troop transports or in some other way for the purpose of assisting in the prosecution of hostilities otherwise than as fighting ships, shall not be within the limitations of this Article.

ARTICLE XII No vessel of war of any of the Contracting Powers, hereafter laid down, other than a capital ship, shall carry a gun with a calibre in excess of 8 inches (203 millimetres).

ARTICLE XIII Except as provided in Article IX, no ship designated in the present Treaty to be scrapped may be reconverted into a vessel of war.

ARTICLE XIV No preparations shall be made in merchant ships in time of peace for the installation of warlike armaments for the purpose of converting such ships into vessels of war, other than the necessary stiffening of decks for the mounting of guns not exceeding 6 inches (152 millimetres) calibre.

ARTICLE XV No vessel of war constructed within the jurisdiction of any of the Contracting Powers for a non-Contracting Power shall exceed the limitations as to displacement and armament prescribed by the present Treaty for vessels of a similar type which may be constructed by or for any of the Contracting Powers; provided however, that the displacement for aircraft carriers constructed for a non-Contracting Power shall in no case exceed 27,000 tons (27,432 metric tons) standard displacement.

ARTICLE XVI If the construction of any vessel of war for a non-Contracting Power is undertaken within the jurisdiction of any of the Contracting Powers such Power shall promptly inform the other Contracting Powers of the date of the signing of the contract and the date on which the keel of the ship is laid; and shall also communicate to them the particulars relating to the ship prescribed in Chapter II, Part 3, Section 1 (b), (4) and (5).

ARTICLE XVII In the event of a Contracting Power being engaged in war, such Power shall not use as a vessel of war any vessel of war which may be under construction within its jurisdiction for any other Power, or which may have been constructed within its jurisdiction for another Power and not delivered.

ARTICLE XVIII Each of the Contracting Powers undertakes not to dispose by gift, sale or any mode of transfer of any vessel of war in such a manner that such vessel may become a

Digitized by Google

vessel of war in the Navy of any foreign Power.

ARTICLE XIX The United States, the British Empire and Japan agree that the status quo at the time of the signing of the present Treaty, with regard to fortifications and naval bases, shall be maintained in their respective territories and possessions specified hereunder:

(1) The insular possessions which the United States now holds or may hereafter acquire in the Pacific Ocean, except (a) those adjacent to the coast of the United States, Alaska and the Panama Canal Zone, not including the Aleutian Islands, and (b) the Hawaiian Islands;

(2) Hongkong and the insular possessions which the British Empire now holds or may hereafter acquire in the Pacific Ocean, east of the meridian of 110° east longitude, except (a) those adjacent to the coast of Canada, (b) the Commonwealth of Australia and its Territories, and (c) New Zealand;

(3) The following insular territories and possessions of Japan in the Pacific Ocean, to wit: the Kurile Islands, the Bonin Islands, Amami-Oshima, the Loochoo Islands, Formosa and the Pescadores, and any insular territories or possessions in the Pacific Ocean which Japan may hereafter acquire.

The maintenance of the status quo under the foregoing provisions implies that no new fortifications or naval bases shall be established in the territories and possessions specified; that no measures shall be taken to increase the existing naval facilities for the repair and maintenance of naval forces, and that no increase shall be made in the coast defences of the territories and possessions above specified. This restriction, however, does not preclude such repair and replacement of worn-out weapons and equipment as is customary in naval and military establishments in time of peace.

ARTICLE XX The rules for determining tonnage displacement prescribed in Chapter II, Part 4, shall apply to the ships of each of the Contracting Powers.

CHAPTER II
Rules Relating to the Execution of the Treaty—Definition of Terms

PART 1
Capital Ships Which may be Retained by the Contracting Powers

In accordance with Article II ships may be retained by each of the Contracting Powers as specified in this Part.

Ships which may be retained by the United states.

Name:	Tonnage
Maryland	32,600
California	32,300
Tennessee	32,300
Idaho	32,000
New Mexico	32,000
Mississippi	32,000
Arizona	31,400
Pennsylvania	31,400
Oklahoma	27,500
Nevada	27,500
New York	27,000
Texas	27,000
Arkansas	26,000
Wyoming	26,000
Florida	21,825
Utah	21,825
North Dakota	20,000
Delaware	20,000
Total tonnage	500,650

On the completion of the two ships of the West Virginia class and the scrapping of the North Dakota and Delaware, as provided in Article II, the total tonnage to be retained by the United States will be 525,850 tons.

Ships which may be retained by the British Empire.

Name:	Tonnage
Royal Sovereign	25,750
Royal Oak	25,750
Revenge	25,750
Resolution	25,750
Ramillies	25,750
Malaya	27,500
Valiant	27,500
Barham	27,500
Queen Elizabeth	27,500
Warspite	27,000
Benbow	25,000

Digitized by Google

Name:	Tonnage
Emperor of India	25,000
Iron Duke	25,000
Marlborough	25,000
Hood	41,200
Renown	26,500
Repulse	26,500
Tiger	28,500
Thunderer	22,500
King George V	23,000
Ajax	23,000
Centurion	23,000
Total tonnage	580,450

On the completion of the two new ships to be constructed and the scrapping of the Thunderer, King George V, Ajax, and Centurion, as provided in Article II, the total tonnage to be retained by the British Empire will be 558,950 tons.

Ships which may be retained by France.

Name:	Tonnage (metric tons)
Bretagne	23,500
Lorraine	23,500
Provence	23,500
Paris	23,500
France	23,500
Jean Bart	23,500
Courtbet	23,500
Condorcet	18,890
Diderot	18,890
Voltaire	18,890
Total tonnage	221,170

France may lay down new tonnage in the years 1927, 1929, and 1931, as provided in Part 3, Section 2.

Ships which may be retained by Italy.

Name:	Tonnage (metric tons)
Andrea Doria	22,700
Caio Duilio	22,700
Conte Di Cavour	22,500
Giulio Cesare	22,500
Leonardo Da Vinci	22,500
Dante Alighieri	19,500
Roma	12,600
Napoli	12,600
Vittorio Emanuele	12,600
Regina Elena	12,600
Total tonnage	182,800

Italy may lay down new tonnage in the years 1927, 1929, and 1931, as provided in Part 3, Section 2.

Ships which may be retained by Japan.

Name:	Tonnage
Mutsu	33,800
Nagato	33,800
Hiuga	31,260
Ise	31,260
Yamashiro	30,600
Fu-so	30,600
Kirishima	27,500
Haruna	27,500
Hiyei	27,500
Kongo	27,500
Total tonnage	301,320

PART 2

Rules for Scrapping Vessels of War

The following rules shall be observed for the scrapping of vessels of war which are to be disposed of in accordance with Articles II and III.

I. A vessel to be scrapped must be placed in such condition that it cannot be put to combatant use.

II. This result must be finally effected in any one of the following ways:

(a) Permanent sinking of the vessel.

(b) Breaking the vessel up. This shall always involve the destruction or removal of all machinery, boilers and armour, and all deck, side and bottom plating.

(c) Converting the vessel to target use exclusively. In such case all the provisions of paragraph III of this Part, except sub-paragraph (6), in so far as may be necessary to enable the ship to be used as a mobile target, and except sub-paragraph (7), must be previously complied with. Not more than one capital ship may be retained for this purpose at one time by any of the Contracting Powers.

(d) Of the capital ships which would otherwise be scrapped under the present Treaty in or after the year 1931, France and Italy may each retain two sea-going vessels for training purposes exclusively, that is, as gunnery or torpedo schools. The two vessels retained by France shall be of the Jean Bart class, and of those retained by Italy one shall be the Dante Alighieri, the other of the Giulio Cesare class. On retaining these ships for the purpose

Digitized by Google

above stated, France and Italy respectively undertake to remove and destroy their conning-towers, and not use the said ships as vessels of war.

III. (a) Subject to the special exceptions contained in Article IX, when a vessel is due for scrapping, the first stage of scrapping, which consists in rendering a ship incapable of further warlike service, shall be immediately undertaken.

(b) A vessel shall be considered incapable of further warlike service when there shall have been removed and landed, or else destroyed in the ship :

(1) All guns and essential portions of guns, fire-control tops and revolving parts of all barbettes and turrets ;

(2) All machinery for working hydraulic or electric mountings ;

(3) All fire-control instruments and range-finders ;

(4) All ammunition, explosives and mines ;

(5) All torpedoes, warheads and torpedo tubes ;

(6) All wireless telegraphy installations ;

(7) The conning tower and all side armour, or alternatively all main propelling machinery ; and

(8) All landing and flying-off platforms and all other aviation accessories.

IV. The periods in which scrapping of vessels is to be effected are as follows :

(a) In the case of vessels to be scrapped under the first paragraph of Article II, the work of rendering the vessels incapable of further warlike service, in accordance with paragraph III of this Part, shall be completed within six months from the coming into force of the present Treaty, and the scrapping shall be finally effected within eighteen months from such coming into force.

(b) In the case of vessels to be scrapped under the second and third paragraphs of Article II, or under Article III, the work of rendering the vessel incapable of further warlike service in accordance with paragraph III of this Part shall be commenced not later than the date of completion of its successor, and shall be finished within six months from the date of such completion. The vessel shall be finally scrapped, in accordance with paragraph II of this Part, within eighteen months from the date of completion of its successor. If, however, the completion of the new vessel be delayed, then the work of rendering the old vessel incapable of further warlike service in accordance with paragraph III of this Part shall be commenced within four years from the laying of the keel of the new vessel, and shall be finished within six months from the date on which such work was commenced, and the old vessel shall be finally scrapped in accordance with paragraph II of this Part within eighteen months from the date when the work of rendering it incapable of further warlike service was commenced.

PART 3

Replacement

The replacement of capital ships and aircraft carriers shall take place according to the rules in Section I and the tables in Section II of this Part.

SECTION I

Rules for Replacement

(a) Capital ships and aircraft carriers twenty years after the date of their completion may, except as otherwise provided in Article VIII and in the tables in Section II of this Part, be replaced by new construction, but within the limits prescribed in Article IV and Article VII. The keels of such new construction may, except as otherwise provided in Article VIII and in the tables in Section II of this Part, be laid down not earlier than seventeen years from the date of completion of the tonnage to be replaced, provided, however, that no capital ship tonnage, with the exception of the ships referred to in the third paragraph of Article II, and the replacement tonnage specifically mentioned in Section II of this Part, shall be laid down until ten years from November 12, 1921.

(b) Each of the Contracting Powers shall communicate promptly to each of the other Contracting Powers the following information :

Digitized by Google

(1) The names of the capital ships and aircraft carriers to be replaced by new construction;

(2) The date of governmental authorization of replacement tonnage;

(3) The date of laying the keels of replacement tonnage;

(4) The standard displacement in tons and metric tons of each new ship to be laid down, and the principal dimensions, namely, length at waterline, extreme beam at or below waterline, mean draft at standard displacement;

(5) The date of completion of each new ship and its standard displacement in tons and metric tons, and the principal dimensions, namely, length at water-line, extreme beam at or below waterline, mean draft at standard displacement, at time of completion.

(c) In case of loss or accidental destruction of capital ships or aircraft carriers, they may immediately be replaced by new construction subject to the tonnage limits prescribed in Articles IV and VII and in conformity with the other provisions of the present Treaty, the regular replacement programme being deemed to be advanced to that extent.

(d) No retained capital ships or aircraft carriers shall be reconstructed except for the purpose of providing means of defence against air and submarine attack, and subject to the following rules: The Contracting Powers may, for that purpose, equip existing tonnage with bulge or blister or anti-air attack deck protection, providing the increase of displacement thus effected does not exceed 3,000 tons (3,048 metric tons) displacement for each ship. No alterations in side armour, in calibre, number or general type of mounting of main armament shall be permitted except:

(1) in the case of France and Italy, which countries within the limits allowed for bulge may increase their armour protection and the calibre of the guns now carried on their existing capital ships so as not to exceed 16 inches (406 millimetres) and

(2) the British Empire shall be permitted to complete, in the case of the Renown, the alterations to armour that have already been commenced but temporarily suspended.

1942	—	I	Mutsu (22)	0	9

* Japan may retain the Shikishima and Asahi for non-combatant purposes, after complying with the provisions of Part 2, III, (b).

Note.—A, B, C, D, etc., represent individual capital ships of 35,000 tons standard displacement, laid down and completed in the years specified.

Note Applicable to All the Tables in Section II

The order above prescribed in which ships are to be scrapped is in accordance with their age. It is understood that when replacements begin according to the above tables the order of scrapping in the case of the ships of each of the Contracting Powers may be varied at its option; provided, however, that such Power shall scrap in each year the number of ships above stated.

PART 4

Definitions

For the purpose of the present Treaty, the following expressions are to be understood in the sense defined in this Part.

Capital Ship

A capital ship, in the case of ships hereafter built, is defined as a vessel of war, not an aircraft carrier, whose displacement exceeds 10,000 tons (10,160 metric tons) standard displacement, or which carries a gun with a calibre exceeding 8 inches (203 millimetres).

Aircraft Carrier

An aircraft carrier is defined as a vessel of war with a displacement in excess of 10,000 tons (10,160 metric tons) standard displacement designed for the specific and exclusive purpose of carrying aircraft. It must be so constructed that aircraft can be launched therefrom and landed thereon, and not designed and constructed for carrying a more powerful armament than that allowed to it under Article IX or Article X as the case may be.

Standard Displacement

The standard displacement of a ship

Digitized by Google

is the displacement of the ship complete, fully manned, engined, and equipped ready for sea, including all armament and ammunition, equipment, outfit, provisions and fresh water for crew, miscellaneous stores and implements of every description that are intended to be carried in war, but without fuel or reserve feed water on board.

The word "ton" in the present Treaty, except in the expression "metric tons", shall be understood to mean the ton of 2,240 pounds (1,016 kilos).

Vessels now completed shall retain their present ratings of displacement tonnage in accordance with their national system of measurement. However, a Power expressing displacement in metric tons shall be considered for the application of the present Treaty as owning only the equivalent displacement in tons of 2,240 pounds.

A vessel completed hereafter shall be rated at its displacement tonnage when in the standard condition defined herein.

CHAPTER III

Miscellaneous Provisions

ARTICLE XXI If during the term of the present Treaty the requirements of the national security of any Contracting Power in respect of naval defence are, in the opinion of that Power, materially affected by any change of circumstances the Contracting Powers will, at the request of such Power, meet in conference with a view to the reconsideration of the provisions of the Treaty and its amendment by mutual agreement.

In view of possible technical and scientific developments, the United States, after consultation with the other Contracting Powers shall arrange for a conference of all the Contracting Powers which shall convene as soon as possible after the expiration of eight years from the coming into force of the present Treaty to consider what changes, if any, in the Treaty may be necessary to meet such developments.

ARTICLE XXII Whenever any Contracting Power shall become engaged in a war which in its opinion affects the naval defence of its national security, such Power may after notice to the other Contracting Powers suspend for the period of hostilities its obligations under the present Treaty other than those under Articles XIII and XVII, provided that such Power shall notify the other Contracting Powers that the emergency is of such a character as to require such suspension.

The remaining Contracting Powers shall in such case consult together with a view to agreement as to what temporary modifications, if any, should be made in the Treaty as between themselves. Should such consultation not produce agreement, duly made in accordance with the constitutional methods of the respective Powers, any one of said Contracting Powers may, by giving notice to the other Contracting Powers, suspend for the period of hostilities its obligations under the present Treaty, other than those under Articles XIII and XVII.

On the cessation of hostilities the Contracting Powers will meet in conference to consider what modifications, if any, should be made in the provisions of the present Treaty.

ARTICLE XXIII The present Treaty shall remain in force until December 31st, 1936, and in case none of the Contracting Powers shall have given notice two years before that date of its intention to terminate the Treaty, it shall continue in force until the expiration of two years from the date on which notice of termination shall be given by one of the Contracting Powers, whereupon the Treaty shall terminate as regards all the Contracting Powers. Such notice shall be communicated in writing to the Government of the United States, which shall immediately transmit a certified copy of the notification to the other Powers and inform them of the date on which it was received. The notice shall be deemed to have been given and shall take effect on that date. In the event of notice of termination being given by the Government of the United States, such notice shall be given to the diplomatic representatives at Washington of the other Contracting Powers, and the notice shall be deemed to have been given and shall take on the date of the communication made to the said diplomatic representatives.

Within one year of the date on which

Digitized by Google

notice of termination by any Power has taken effect, all the Contracting Powers shall meet in conference.

ARTICLE XXIV The present Treaty shall be ratified by the Contracting Powers in accordance with their respective constitutional methods and shall take effect on the date of the deposit of all the ratifications, which shall take place at Washington as soon as possible. The Government of the United States will transmit to the other Contracting Powers a certified copy of the procès-verbal of the deposit of ratifications.

The present Treaty, of which the French and English texts are both authentic, shall remain deposited in the archives of the Government of the United States, and duly certified copies thereof shall be transmitted by that Government to the other Contracting Powers.

THE LONDON NAVAL TREATY OF 1930

PART 1

ARTICLE I The High Contracting Parties agree not to exercise their rights to lay down the keels of capital ship replacement tonnage during the years 1931-1936 inclusive as provided in Chapter II, Part 3 of the Treaty for the Limitation of Naval Armament signed between them at Washington on the 6th February, 1922, and referred to in the present Treaty as the Washington Treaty.

This provision is without prejudice to the disposition relating to the replacement of ships accidentally lost or destroyed contained in Chapter II, Part 3, Section 1, paragraph (c) of the said Treaty.

France and Italy may, however, build the replacement tonnage which they were entitled to lay down in 1927 and 1929 in accordance with the provisions of the said Treaty.

ARTICLE II 1. The United States, the United Kingdom of Great Britain and Northern Ireland and Japan shall dispose of the following capital ships as provided in this Article:

United States:
"Florida".
"Utah".
"Arkansas" or "Wyoming".

United Kingdom:
"Benbow".
"Iron Duke".
"Marlborough".
"Emperor of India".
"Tiger".

Japan:
"Hiyei".

(a) Subject to the provisions of subparagraph (b), the above ships, unless converted to target use exclusively in accordance with Chapter II, Part 2, paragraph II (c) of the Washington Treaty, shall be scrapped in the following manner:

One of the ships to be scrapped by the United States, and two of those to be scrapped by the United Kingdom shall be rendered unfit for warlike service, in accordance with Chapter II, Part 2, paragraph III (b) of the Washington Treaty, within twelve months from the coming into force of the present Treaty. These ships shall be finally scrapped, in accordance with paragraph II (a) or (b) of the said Part 2, within twenty-four months from the said coming into force. In the case of the second of the ships to be scrapped by the United States, and of the third and fourth of the ships to be scrapped by the United Kingdom, the said periods shall be eighteen and thirty months respectively from the coming into force of the present Treaty.

(b) Of the ships to be disposed of under this Article, the following may be retained for training purposes:

by the United States:
"Arkansas" or "Wyoming".
by the United Kingdom:
"Iron Duke".
by Japan:
"Hiyei".

These ships shall be reduced to the condition prescribed in Section V of Annex II to Part 2 of the present Treaty. The work of reducing these vessels to the required condition shall begin, in the case of the United States and the United Kingdom, within twelve months, and in the case of Japan within eighteen months from the coming

Digitized by Google

into force of the present Treaty; the work shall be completed within six months of the expiration of the above-mentioned periods.

Any of these ships which are not retained for training purposes shall be rendered unfit for warlike service within eighteen months, and finally scrapped within thirty months, of the coming into force of the present Treaty.

2. Subject to any disposal of capital ships which might be necessitated, in accordance with the Washington Treaty, in the building by France or Italy of the replacement tonnage referred to in Article I of the present Treaty, all existing capital ships mentioned in Chapter II, Part 3, Section II of the Washington Treaty and not designated above to be disposed of may be retained during the term of the present Treaty.

3. The right of replacement is not lost by delay in laying down replacement tonnage, and the old vessel may be retained until replaced even though due for scrapping under Chapter II, Part 3, Section II of the Washington Treaty.

ARTICLE III 1. For the purposes of the Washington Treaty, the definition of an aircraft carrier given in Chapter II, Part 4 of the said Treaty is hereby replaced by the following definition:

> The expression "aircraft carrier" includes any surface vessel of war, whatever its displacement, designed for the specific and exclusive purpose of carrying aircraft and so constructed that aircraft can be launched therefrom and landed thereon.

2. The fitting of a landing-on or flying-off platform or deck on a capital ship, cruiser or destroyer, provided such vessel was not designed or adapted exclusively as an aircraft carrier, shall not cause any vessel so fitted to be charged against or classified in the category of aircraft carriers.

3. No capital ship in existence on the 1st April, 1930, shall be fitted with a landing-on platform or deck.

ARTICLE IV 1. No aircraft carrier of 10,000 tons (10,160 metric tons) or less standard displacement mounting a gun above 6.1-inch (155 mm.) calibre shall be acquired by or constructed by or for any of the High Contracting Parties.

2. As from the coming into force of the present Treaty in respect of all the High Contracting Parties, no aircraft carrier of 10,000 tons (10,160 metric tons) or less standard displacement mounting a gun above 6.1-inch (155 mm.) calibre shall be constructed within the jurisdiction of any of the High Contracting Parties.

ARTICLE V An aircraft carrier must not be designed and constructed for carrying a more powerful armament than that authorized by Article IX or Article X of the Washington Treaty, or by Article IV of the present Treaty, as the case may be.

Wherever in the said Articles IX and X the calibre of 6 inches (152 mm.) is mentioned, the calibre of 6.1 inches (155 mm.) is substituted therefor.

PART II

ARTICLE VI 1. The rules for determining standard displacement prescribed in Chapter II, Part 4 of the Washington Treaty shall apply to all surface vessels of war of each of the High Contracting Parties.

2. The standard displacement of a submarine is the surface displacement of the vessel complete (exclusive of the water in non-watertight structure) fully manned, engined, and equipped ready for sea, including all armament and ammunition, equipment, outfit, provisions for crew, miscellaneous stores, and implements of every description that are intended to be carried in war, but without fuel, lubricating oil, fresh water or ballast water of any kind on board.

3. Each naval combatant vessel shall be rated at its displacement tonnage when in the standard condition. The word "ton", except in the expression "metric tons", shall be understood to be the ton of 2,240 pounds (1,016 kilos).

ARTICLE VII 1. No submarine the standard displacement of which exceeds 2,000 tons (2,032 metric tons) or with a gun above 5.1-inch (130 mm.) calibre shall be acquired by or constructed by or for any of the High Contracting Parties.

2. Each of the High Contracting Parties may, however, retain to build or acquire a maximum number of three

Digitized by Google

submarines of a standard displacement not exceeding 2,800 tons (2,845 metric tons); these submarines may carry guns not above 6.1-inch (155 mm.) calibre. Within this number, France may retain one unit, already launched, of 2,880 tons (2,926 metric tons), with guns the calibre of which is 8 inches (203 mm.).

3. The High Contracting Parties may retain the submarines which they possessed on the 1st April, 1930, having a standard displacement not in excess of 2,000 tons (2,032 metric tons) and armed with guns above 5.1-inch (130 mm.) calibre.

4. As from the coming into force of the present Treaty in respect of all the High Contracting Parties, no submarine the standard displacement of which exceeds 2,000 tons (2,032 metric tons) or with a gun above 5.1-inch (130 mm.) calibre shall be constructed within the jurisdiction of any of the High Contracting Parties, except as provided in paragraph 2 of this Article.

ARTICLE VIII Subject to any special agreements which may submit them to limitation, the following vessels are exempt from limitation:

(a) naval surface combatant vessels of 600 tons (610 metric tons) standard displacement and under;

(b) naval surface combatant vessels exceeding 600 tons (610 metric tons), but not exceeding 2,000 tons, (2,032 metric tons) standard displacement, provided they have none of the following characteristics:

(1) mount a gun above 6.1-inch (155 mm.) calibre;

(2) mount more than four guns above 3-inch (76 mm.) calibre;

(3) are designed or fitted to launch torpedoes;

(4) are designed for a speed greater than twenty knots.

(c) naval surface vessels not specifically built as fighting ships which are employed on fleet duties or as troop transports or in some other way than as fighting ships, provided they have none of the following characteristics:

(1) mount a gun above 6.1-inch (155 mm.) calibre;

(2) mount more than four guns above 3-inch (76 mm.) calibre;

(3) are designed or fitted to launch torpedoes;

(4) are designed for a speed greater than twenty knots;

(5) are protected by armour plate;

(6) are designed or fitted to launch mines;

(7) are fitted to receive aircraft on board from the air;

(8) mount more than one aircraft-launching apparatus on the centre line; or two, one on each broadside;

(9) if fitted with any means of launching aircraft into the air, are designed or adapted to operate at sea more than three aircraft.

ARTICLE IX The rules as to replacement contained in Annex I to this Part II are applicable to vessels of war not exceeding 10,000 tons (10,160 metric tons) standard displacement, with the exception of aircraft carriers, whose replacement is governed by the provisions of the Washington Treaty.

ARTICLE X Within one month after the date of laying down and the date of completion respectively of each vessel of war, other than capital ships, aircraft carriers and the vessels exempt from limitation under Article 8, laid down or completed by or for them after the coming into force of the present Treaty, the High Conracting Parties shall communicate to each of the other High Contracting Parties the information detailed below:

(a) the date of laying the keel and the following particulars:

classification of the vessel;
standard displacement in tons and metric tons;
principal dimensions, namely:
length at water-line, extreme beam at or below water-line;
mean draft at standard displacement;
calibre of the largest gun.

(b) the date of completion together with the foregoing particulars relating to the vessel at that date.

The information to be given in the case of capital ships and aircraft carriers is governed by the Washington Treaty.

ARTICLE XI Subject to the provisions of Article 2 of the present Treaty, the rules for disposal contained in Annex II to this Part II shall be applied to all vessels of war to be disposed of under the said Treaty, and to aircraft carriers as defined in Article 3.

Digitized by Google

ARTICLE XII 1. Subject to any supplementary agreements which may modify, as between the High Contracting Parties concerned, the lists in Annex III to this Part II, the special vessels shown therein may be retained and their tonnage shall not be included in the tonnage subject to limitation.

2. Any other vessel constructed, adapted or acquired to serve the purposes for which these special vessels are retained shall be charged against the tonnage of the appropriate combatant category, according to the characteristics of the vessels, unless such vessel conforms to the characteristics of vessels exempt from limitation under Article 8.

3. Japan may, however, replace the minelayers "Aso" and "Tokiwa" by two new minelayers before the 31st December, 1936. The standard displacement of each of the new vessels shall not exceed 5,000 tons (5,080 metric tons); their speed shall not exceed twenty knots, and their other characteristics shall conform to the provisions of paragraph (b) of Article 8. The new vessels shall be regarded as special vessels and their tonnage shall not be chargeable to the tonnage of any combatant category. The "Aso" and "Tokiwa" shall be disposed of in accordance with Section I or II of Annex II to this Part II, on completion of the replacement vessels.

4. The "Asama", "Yakumo", "Izumo", "Iwaté" and "Kasuga" shall be disposed of in accordance with Section I or II of Annex II to this Part II when the first three vessels of the "Kuma" class have been replaced by new vessels. These three vessels of the "Kuma" class shall be reduced to the condition prescribed in Section V, sub-paragraph (b) 2 of Annex II to this Part II, and are to be used for training ships, and their tonnage shall not thereafter be included in the tonnage subject to limitation.

ARTICLE XIII Existing ships of various types, which, prior to the 1st April, 1930, have been used as stationary training establishments or hulks, may be retained in a non-seagoing condition.

ANNEX I

Rules for Replacement

Section I Except as provided in Section III of this Annex and Part III of the present Treaty, a vessel shall not be replaced before it becomes "over-age". A vessel shall be deemed to be "over-age" when the following number of years have elapsed since the date of its completion :

(a) For a surface vessel exceeding 3,000 tons (3,048 metric tons) but not exceeding 10,000 tons (10,160 metric tons) standard displacement :

(i) if laid down before the 1st January, 1920 : 16 years ;

(ii) if laid down after the 31st December, 1919 : 20 years.

(b) For a surface vessel not exceeding 3,000 tons (3,048 metric tons) standard displacement :

(i) if laid down before the 1st January, 1921 : 12 years ;

(ii) if laid down after the 31st December, 1920 : 16 years.

(c) For a submarine : 13 years.

The keels of replacement tonnage shall not be laid down more than three years before the year in which the vessel to be replaced becomes "over-age"; but this period is reduced to two years in the case of any replacement surface vessel not exceeding 3,000 tons (3,048 metric tons) standard displacement.

The right of replacement is not lost by delay in laying down replacement tonnage.

Section II Except as otherwise provided in the present Treaty, the vessel or vessels, whose retention would cause the maximum tonnage permitted in the category to be exceeded, shall, on the completion or acquisition of replacement tonnage, be disposed of in accordance with Annex II to this part II.

Section III In the event of loss or accidental destruction a vessel may be immediately replaced.

ANNEX II

Rules for Disposal of Vessels of War

The present Treaty provides for the disposal of vessels of war in the following ways :

(i) by scrapping (sinking or breaking up);

Digitized by Google

(ii) by converting the vessel to a hulk;

(iii) by converting the vessel to target use exclusively;

(iv) by retaining the vessel exclusively for experimental purposes;

(v) by retaining the vessel exclusively for training purposes.

Any vessel of war to be disposed of, other than a capital ship, may either be scrapped or converted to a hulk at the option of the High Contracting Party concerned.

Vessels, other than capital ships, which have been retained for target, experimental or training purposes, shall finally be scrapped or converted to hulks.

Section I Vessels to be scrapped.

(a) A vessel to be disposed of by scrapping, by reason of its replacement, must be rendered incapable of warlike service within six months of the date of the completion of its successor, or of the first of its successors if there are more than one. If, however, the completion of the new vessel or vessels be delayed, the work of rendering the old vessel incapable of warlike service shall, nevertheless, be completed within four and a half years from the date of laying the keel of the new vessel, or of the first of the new vessels; but should the new vessel, or any of the new vessels, be a surface vessel not exceeding 3,000 tons (3,048 metric tons) standard displacement, this period is reduced to three and a half years.

(b) A vessel to be scrapped shall be considered incapable of warlike service when there shall have been removed and landed or else destroyed in the ship:

(1) all guns and essential parts of guns, fire control tops and revolving parts of all barbettes and turrets;

(2) all hydraulic or electric machinery for operating turrets;

(3) all fire control instruments and rangefinders;

(4) all ammunition, explosives, mines and mine rails;

(5) all torpedoes, war heads, torpedo tubes and training racks;

(6) all wireless telegraphy installations;

(7) all main propelling machinery, or alternatively the armoured conning tower and all side armour plate;

(8) all aircraft cranes, derricks, lifts and launching apparatus. All landing-on or flying-off platforms and decks, or alternatively all main propelling machinery;

(9) in addition, in the case of submarines, all main storage batteries, air compressor plants and ballast pumps.

(c) Scrapping shall be finally effected in either of the following ways within twelve months of the date on which the work of rendering the vessel incapable of warlike service is due for completion:

(1) permanent sinking of the vessel;

(2) breaking the vessel up; this shall always include the destruction or removal of all machinery, boilers and armour, and all deck, side and bottom plating.

Section II Vessels to be converted to hulks.

A vessel to be disposed of by conversion to a hulk shall be considered finally disposed of when the conditions prescribed in Section I, paragraph (b), have been complied with, omitting subparagraphs (6), (7) and (8), and when the following have been effected:

(1) mutilation beyond repair of all propeller shafts, thrust blocks, turbine gearing or main propelling motors, and turbines or cylinders of main engines;

(2) removal of propeller brackets;

(3) removal and breaking up of all aircraft lifts, and the removal of all aircraft cranes, derricks and launching apparatus.

The vessel must be put in the above condition within the same limits of time as provided in Section I for rendering a vessel incapable of warlike service.

Section III Vessels to be converted to target use.

(a) A vessel to be disposed of by conversion to target use exclusively shall be considered incapable of warlike service when there have been removed and landed, or rendered unserviceable on board, the following:

(1) all guns;

(2) all fire control tops and instruments and main fire control communication wiring;

(3) all machinery for operating gun mountings or turrets;

(4) all ammunition, explosives, mines, torpedoes and torpedo tubes;

Digitized by Google

(5) all aviation facilities and accessories.

The vessel must be put into the above condition within the same limits of time as provided in Section I for rendering a vessel incapable of warlike service.

(b) In addition to the rights already possessed by each High Contracting Party under the Washington Treaty, each High Contracting Party is permitted to retain, for target use exclusively, at any one time:

(1) not more than three vessels (cruisers or destroyers), but of these three vessels only one may exceed 3,000 tons (3,048 metric tons) standard displacement;

(2) one submarine.

(c) On retaining a vessel for target use, the High Contracting Party concerned undertakes not to recondition it for warlike service.

Section IV Vessels retained for experimental purposes.

(a) A vessel to be disposed of by conversion to experimental purposes exclusively shall be dealt with in accordance with the provisions of Section III (a) of this Annex.

(b) Without prejudice to the general rules, and provided that due notice be given to the other High Contracting Parties, reasonable variation from the conditions prescribed in Section III (a) of this Annex, in so far as may be necessary for the purposes of special experiment, may be permitted as a temporary measure.

Any High Contracting Party taking advantage of this provision is required to furnish full details of any such variations and the period for which they will be required.

(c) Each High Contracting Party is permitted to retain for experimental purposes exclusively at any one time:

(1) not more than two vessels (cruisers or destroyers), but of these two vessels only one may exceed 3,000 tons (3,048 metric tons) standard displacement;

(2) one submarine.

(d) The United Kingdom is allowed to retain, in their present conditions, the monitor "Roberts", the main armament guns and mountings of which have been mutilated, and the seaplane carrier "Ark Royal", until no longer required for experimental purposes. The retention of these two vessels is without prejudice to the retention of vessels permitted under (c) above.

(e) On retaining a vessel for experimental purposes the High Contracting Party concerned undertakes not to recondition it for warlike service.

Section V Vessels retained for training purposes.

(a) In addition to the rights already possessed by any High Contracting Party under the Washington Treaty, each High Contracting Party is permitted to retain for training purposes exclusively the following vessels:

United States: 1 capital ship ("Arkansas" or "Wyoming");

France: 2 surface vessels, one of which may exceed 3,000 tons (3,048 metric tons) standard displacement;

United Kingdom: 1 capital ship ("Iron Duke");

Italy: 2 surface vessels, one of which may exceed 3,000 tons (3,048 metric tons) standard displacement;

Japan: 1 capital ship ("Hiyei"), 3 cruisers ("Kuma" class).

(b) Vessels retained for training purposes under the provisions of paragraph (a) shall, within six months of the date on which they are required to be disposed of, be dealt with as follows:

1. Capital Ships.

The following is to be carried out:

(1) removal of main armament guns, revolving parts of all barbettes and turrets; machinery for operating turrets; but three turrets with their armament may be retained in each ship;

(2) removed of all ammunition and explosives in excess of the quantity required for target practice training for the guns remaining on board;

(3) removal of conning tower and the side armour belt between the foremost and aftermost barbettes;

(4) removal or mutilation of all torpedo tubes;

(5) removal or mutilation on board of all boilers in excess of the number required for a maximum speed of eighteen knots.

2. Other surface vessels retained by France, Italy and Japan.

The following is to be carried out:

(1) removal of one half of the guns, but four guns of main calibre may be

Digitized by Google

retained on each vessel;

(2) removal of all torpedo tubes;

(3) removal of all aviation facilities and accessories;

(4) removal of one half of the boilers.

(c) The High Contracting Party concerned undertakes that vessels retained in accordance with the provisions of this Section shall not be used for any combatant purpose.

PART III

The President of the United States of America, His Majesty the King of Great Britain, Ireland and the British Dominions beyond the Seas, Emperor of India, and His Majesty the Emperor of Japan, have agreed as between themselves to the provisions of this Part III:

ARTICLE XIV The naval combatant vessels of the United States, the British Commonwealth of Nations and Japan, other than capital ships, aircraft car-

Digitized by Google

riers and all vessels exempt from limitation under Article 8, shall be limited during the term of the present Treaty as provided in this Part III, and, in the case of special vessels, as provided in Article 12.

ARTICLE XV For the purpose of this Part III the definition of the cruiser and destroyer categories shall be as follows :

Cruisers.

Surface vessels of war, other than capital ships or aircraft carriers, the standard displacement of which exceeds 1,850 tons (1,880 metric tons), or with a gun above 5.1-inch (130 mm.) calibre.

The cruiser category is divided into two sub-categories, as follows :

(a) cruisers carrying a gun above 6.1-inch (155 mm.) calibre ;

(b) cruisers carrying a gun not above 6.1-inch (155 mm.) calibre.

Destroyers.

Surface vessels of war the standard displacement of which does not exceed 1,850 tons (1,880 metric tons), and with a gun not above 5.1-inch (130 mm.) calibre.

ARTICLE XVI 1. The completed tonnage in the cruiser, destroyer and submarine categories which is not to be exceeded on the 31st December, 1936, is given in the following table :

Categories	United States	British Commonwealth of Nations	Japan
Cruisers :			
(a) with guns of more than 6'1-inch (155 mm.) calibre.	180,000 tons (182,880 metric tons)	146,800 tons (149,149 metric tons)	108,400 tons (110,134 metric tons)
(b) with guns of 6'1-inch (155 mm.) calibre or less.	143,500 tons (145,796 metric tons)	192,200 tons (195,275 metric tons)	100,450 tons (102,057 metric tons)
Destroyers	150,000 tons (152,400 metric tons)	150,000 tons (152,400 metric tons)	105,500 tons (107,188 metric tons)
Submarines	52,700 tons (53,543 metric tons)	52,700 tons (53,543 metric tons)	52,700 tons (53,543 metric tons)

2. Vessels which cause the total tonnage in any category to exceed the figures given in the foregoing table shall be disposed of gradually during the period ending on the 31st December, 1936.

3. The maximum number of cruisers of sub-category (a) shall be as follows: for the United States, eighteen ; for the British Commonwealth of Nations, fifteen ; for Japan twelve.

4. In the destroyer category not more than sixteen per cent. of the allowed total tonnage shall be employed in vessels of over 1,500 tons (1,524 metric tons) standard displacement. Destroyers completed or under construction on the 1st April, 1930, in excess of this percentage may be retained, but no other destroyers exceeding 1,500 tons (1,524 metric tons) standard displacement shall be constructed or acquired until a reduction to such sixteen per cent. has been effected.

5. Not more than twenty-five per cent. of the allowed total tonnage in the cruiser category may be fitted with a landing-on platform or deck for aircraft.

6. It is understood that the submarines referred to in paragraphs 2 and 3 of Article VII will be counted as part of the total submarine tonnage of the High Contracting Party concerned.

7. The tonnage of any vessels retained under Article XIII or disposed of in accordance with Annex II to Part II of the present Treaty shall not be included in the tonnage subject to limitation.

ARTICLE XVII A transfer not exceeding ten per cent. of the allowed total tonnage of the category or sub-category into which the transfer is to be made shall be permitted between cruisers of sub-category (b) and destroyers.

ARTICLE XVIII The United States contemplates the completion by 1935 of fifteen cruisers of sub-category (a) of an aggregate tonnage of 150,000 tons (152,400 metric tons). For each of the three remaining cruisers of sub-category (a) which it is entitled to construct the United States may elect to substitute 15,166 tons (15,409 metric tons) of cruisers of sub-category (b). In case the United States shall construct one or more of such three remaining

Digitized by Google

on business of various kinds—commercial, industrial and otherwise.

ARTICLE IV The Government of China shall permit joint undertakings, in Eastern Inner Mongolia, of the subjects of Japan and citizens of China, in agriculture and industries auxiliary thereto.

ARTICLE V With respect to the three preceding Articles, the subjects of Japan shall produce before the local authorities the passports duly issued for the purpose of registration, and shall also submit themselves to the police laws and regulations and taxes of China.

In civil and criminal suit, the Japanese consular officer, where a Japanese subject is the defendant, and the Chinese official, where a Chinese citizen is the defendant, shall respectively try and decide the case, both the Japanese consular official and the Chinese official being permitted each to send his agent to attend the trial of the other to watch the proceeding; provided that in civil suits arising out of land disputes between Japanese subjects and Chinese citizens, the cases shall be tried and decided by the joint tribunal composed of the property authorized official of the two countries, in accordance with the laws and local usages of China.

In the future when the judicial system in the said regions shall have been completely reformed, all civil and criminal suits involving Japanese subjects shall be wholly tried and decided by the law-courts of China.

ARTICLE VI The Government of China engage to open of their own accord, as early as possible, cities and towns in Eastern Inner Mongolia, for the residence and trade of foreigners.

ARTICLE VII The Government of China agree to a speedy fundamental revision of various agreements and contracts relating to the Kirin-Changchun Railway, on the basis of the terms embodied in railway loan agreements which China has heretofore entered into with various foreign capitalists.

If, in future, the Chinese Government grant to foreign capitalists, in matters that relate to railway loans, more advantageous terms than those in the various existing railway loan agreements, the above-mentioned Kirin-Changchun Railway Loan Agreement shall, if so desired by Japan, be further revised.

ARTICLE VIII Except as otherwise provided in this Treaty, all existing treaties between Japan and China with respect to Manchuria shall remain in force.

ARTICLE IX The present Treaty shall take effect on the day of its signature.

DECLARATION CONCERNING THE NON-ALIENATION OF THE PROVINCE OF FUKIEN

The Tsung-Li Yamên to the Japanese Minister

Peking, April 26, 1898.

Prince Ch'ing and the Ministers of the Tsung-li Yamên have the honour to reply to a communication from the Minister of Japan dated 2nd day, 3rd intercalary month, 24th year Kuang-Hsü (April 22, 1898), which reads as follows:

"A telegram has just been received from the Minister of Foreign Affairs, which reads as follows:

"'The Government of Japan has viewed with constant deep concern the difficulties which the Government of China has recently been confronted. The declaration made at the time of the evacuation of Weihaiwei is evidence of this. It is to be apprehended that trouble may arise with consequences disastrous to China. In all this there is no mistaking what our real purpose is.

"'In view of the present state of affairs, the Government of Japan, mindful of its own interests, cannot act as if entirely in ignorance of passing events, but must take proper measures to meet any situation that may arise. You will ask the Government of China to make a declaration that it will not cede or lease to any other Power any portion of its territory within the Province of Fu-kien.'"

Referring to his oral statements made in a personal interview, the Minister of Japan requests that a reply be given to his communication.

The Princes and the Ministers have

Digitized by Google

the honour to state that the Province of Fu-kien, with all the territory in the interior and along the sea-coast within its limits, which is an important part of China, China will never cede or lease to any other Power whatsoever; and to request that this reply be communicated to the Government of Japan.

The Princes and the Ministers avail themselves of this opportunity to renew to the Minister of Japan the assurances of their most distinguished consideration.

EXCHANGE OF NOTES*

From the Japanese Minister

Peking, the 25th day of May of the 4th year of Taisho.

Excellency,

A report has reached me to the effect that the Chinese Government has the intention of permitting foreign nations to establish, on the coast of Fukien Province, dockyards, coaling stations for military use, naval bases, or to set up other military establishments; and also of borrowing foreign capital for the purpose of setting up the abovementioned establishments.

I have the honour to request that Your Excellency will be good enough to give me reply stating whether or not the Chinese Government really entertains such an intention.

I avail, etc.

From Chinese Minister of Foreign Affairs

Peking, the 25th day of May of the 4th year of Republic of China.

Monsieur le Ministre,

I have the honour to acknowledge the receipt of Your Excellency's note of this day's date which I have noted.

In reply I beg to inform you that the Chinese Government hereby declares that it has given no permission to foreign nations to construct, on the coast of Fukien Province, dockyards, coaling stations for military use, naval bases, or to set up other military establishments; nor does it entertain an intention of borrowing foreign capital for the purpose of setting up the abovementioned establishments.

I avail, etc.,

* Translation from Chinese text as printed in Rockhill, p. 181. Printed also in Hertslet, p. 1154

SINO-JAPANESE UNDERSTANDING ENTERED INTO IN 1905

Made Public, January 14, 1932

In 1905, when the Treaty concerning Manchuria and the supplementary agreement to it were concluded, the Japanese Government insisted on the insertion in the text of the Treaty definite engagements on certain matters. Since, however, the Chinese Government found it difficult for internal political reasons to consent to the publication of such engagements, it was agreed that these should be merely recorded in the Minutes of the Conference, which were drawn up both in Japanese and Chinese and signed by the Japanese and Chinese Plenipotentiaries. These unpublished understandings totalled sixteen in number. An English version summarising these provisions was submitted, in February, 1906, to the British and the United States Governments in strict confidence by the Japanese Government.

Inasmuch as there seems to be some doubt as to the existence of these understandings in the Minutes of the Conference, and as people even in positions of influence in China have openly denied it, the Government think the present a fit occasion to publish the abovementioned communication made to the Governments of Great Britain and the United States.

Whereas the protocols of the Conference recently held between the Plenipotentiaries of Japan and China with regard to Manchuria are to be kept strictly secret in deference to the desire of the Chinese Government, only such portions of those Protocols as

Digitized by Google

cruisers of sub-category (a), the sixteenth unit will not be laid down before 1933 and will not be completed before 1936; the seventeenth will not be laid down before 1934 and will not be completed before 1937; the eighteenth will not be laid down before 1935 and will not be completed before 1938.

ARTICLE XIX Except as provided in Article XX, the tonnage laid down in any category subject to limitation in accordance with Article XVI shall not exceed the amount necessary to reach the maximum allowed tonnage of the category, or to replace vessels that become "over-age" before the 31st December, 1936. Nevertheless, replacement tonnage may be laid down for cruisers and submarines that become "over-age" in 1937, 1938 and 1939, and for destroyers that become "over-age" in 1937 and 1938.

ARTICLE XX Notwithstanding the rules for replacement contained in Annex I to Part II:

(a) The "Frobisher" and "Effingham" (United Kingdom) may be disposed of during the year 1936. Apart from the cruisers under construction on the 1st April, 1930, the total replacement tonnage of cruisers to be completed, in the case of the British Commonwealth of Nations, prior to the 31st December, 1936, shall not exceed 91,000 tons (92,456 metric tons).

(b) Japan may replace the "Tama" by new construction to be completed during the year 1936.

(c) In addition to replacing destroyers becoming "over-age" before the 31st December, 1936, Japan may lay down, in each of the years 1935 and 1936, not more than 5,200 tons (5,283 metric tons) to replace part of the vessels that become "over-age" in 1938 and 1939.

(d) Japan may anticipate replacement during the term of the present Treaty by laying down not more than 19,200 tons (19,507 metric tons) of submarine tonnage, of which not more than 12,000 tons (12,192 metric tons) shall be completed by the 31st December, 1936.

ARTICLE XXI If, during the term of the present Treaty, the requirements of the national security of any High Contracting Party in respect of vessels of war limited by Part III of the present Treaty are in the opinion of that Party materially affected by new construction of any Power other than those who have joined in Part III of this Treaty, that High Contracting Party will notify the other Parties to Part III as to the increase required to be made in its own tonnages within one or more of the categories of such vessels of war, specifying particularly the proposed increases and the reasons therefor, and shall be entitled to make such increase. Thereupon the other Parties to Part III of this Treaty proportionate increase in the category or categories specified; and the said other Parties shall promptly advise with each other through diplomatic channels as to the situation thus presented.

PART IV

ARTICLE XXII The following are accepted as established rules of International Law:

(1) In their action with regard to merchant ships, submarines must conform to the rules of International Law to which surface vessels are subject.

(2) In particular, except in the case of persistent refusal to stop on being duly summoned, or of active resistance to visit or search, a warship, whether surface vessel or submarine, may not sink or render incapable of navigation a merchant vessel without having first placed passengers, crew and ship's papers in a place of safety. For this purpose the ship's boats are not regarded as a place of safety unless the safety of the passengers and crew is assured, in the existing sea and weather conditions, by the proximity of land, or the presence of another vessel which is in a position to take them on board.

The High Contracting Parties invite all other Powers to express their assent to the above rules.

PART V

ARTICLE XXIII The present Treaty shall remain in force until the 31st December, 1936, subject to the following exceptions:

(1) Part IV shall remain in force without limit of time;

(2) the provisions of Articles III, IV and V, and of Article XI and Annex II to Part II so far as they relate to aircraft

Digitized by Google

carriers, shall remain in force for the same period as the Washington Treaty.

Unless the High Contracting Parties should agree otherwise by reason of a more general agreement limiting naval armaments, to which they all become parties, they shall meet in conference in 1935 to frame a new treaty to replace and to carry out the purposes of the present Treaty, it being understood that none of the provisions of the present Treaty shall prejudice the attitude of any of the High Contracting Parties at the conference agreed to.

ARTICLE XXIV 1. The present Treaty shall be ratified by the High Contracting Parties in accordance with their respective constitutional methods and the ratifications shall be deposited at London as soon as possible. Certified copies of all the procès-verbaux of the deposit of ratifications will be transmitted to the Governments of all the High Contracting Parties.

2. As soon as the ratifications of the United States of America, of His Majesty the King of Great Britain, Ireland and the British Dominions beyond the Seas, the Emperor of India, in respect of each and all of the Members of the British Commonwealth of Nations as enumerated in the preamble of the present Treaty, and of His Majesty the Emperor of Japan have been deposited, the Treaty shall come into force in respect of the said High Contracting Parties.

3. On the date of the coming into force referred to in the preceding paragraph, Parts I, II, IV and V of the present Treaty will come into force in respect of the French Republic and the Kingdom of Italy if their ratifications have been deposited at that date; otherwise these Parts will come into force in respect of each of those Powers on the deposit of its ratification.

4. The rights and obligations resulting from Part III of the present Treaty are limited to the High Contracting Parties mentioned in paragraph 2 of this Article. The High Contracting Parties will agree as to the date on which, and the conditions under which, the obligations assumed under the said Part III by the High Contracting Parties mentioned in paragraph 2 of this Article will bind them in relation to France and Italy; such agreement will determine at the same time the corresponding obligations of France and Italy in relation to the other High Contracting Parties.

ARTICLE XXV After the deposit of the ratifications of all the High Contracting Parties, His Majesty's Government in the United Kingdom of Great Britain and Northern Ireland will communicate the provisions inserted in Part IV of the present Treaty to all Powers which are not signatories of the said Treaty, inviting them to accede thereto definitely and without limit of time.

Such accession shall be effected by a declaration addressed to His Majesty's Government in the United Kingdom of Great Britain and Northern Ireland.

ARTICLE XXVI The present Treaty, of which the French and English texts are both authentic, shall remain deposited in the archives of His Majesty's Government in the United Kingdom of Great Britain and Northern Ireland. Duly certified copies thereof shall be transmitted to the Governments of all the High Contracting Parties.

TREATY RESPECTING SOUTH MANCHURIA AND EASTERN INNER MONGOLIA

Signed at Peking, May 25, 1915

ARTICLE I The High Contracting Parties mutually agree to extend the term of the lease of Port Arthur and Dairen, and the term relating to the South Manchuria Railway and to the Antung-Mukden Railway, to a period of ninety-nine years respectively.

ARTICLE II The subjects of Japan shall be permitted in South Manchuria to lease land necessary either for erecting buildings for various commercial and industrial uses or for agricultural purposes.

ARTICLE III The subjects of Japan shall have liberty to enter, travel and reside in South Manchuria and to carry

Digitized by Google

on business of various kinds—commercial, industrial and otherwise.

ARTICLE IV The Government of China shall permit joint undertakings, in Eastern Inner Mongolia, of the subjects of Japan and citizens of China, in agriculture and industries auxiliary thereto.

ARTICLE V With respect to the three preceding Articles, the subjects of Japan shall produce before the local authorities the passports duly issued for the purpose of registration, and shall also submit themselves to the police laws and regulations and taxes of China.

In civil and criminal suit, the Japanese consular officer, where a Japanese subject is the defendant, and the Chinese official, where a Chinese citizen is the defendant, shall respectively try and decide the case, both the Japanese consular official and the Chinese official being permitted each to send his agent to attend the trial of the other to watch the proceeding; provided that in civil suits arising out of land disputes between Japanese subjects and Chinese citizens, the cases shall be tried and decided by the joint tribunal composed of the property authorized official of the two countries, in accordance with the laws and local usages of China.

In the future when the judicial system in the said regions shall have been completely reformed, all civil and criminal suits involving Japanese subjects shall be wholly tried and decided by the law-courts of China.

ARTICLE VI The Government of China engage to open of their own accord, as early as possible, cities and towns in Eastern Inner Mongolia, for the residence and trade of foreigners.

ARTICLE VII The Government of China agree to a speedy fundamental revision of various agreements and contracts relating to the Kirin-Changchun Railway, on the basis of the terms embodied in railway loan agreements which China has heretofore entered into with various foreign capitalists.

If, in future, the Chinese Government grant to foreign capitalists, in matters that relate to railway loans, more advantageous terms than those in the various existing railway loan agreements, the above-mentioned Kirin-Changchun Railway Loan Agreement shall, if so desired by Japan, be further revised.

ARTICLE VIII Except as otherwise provided in this Treaty, all existing treaties between Japan and China with respect to Manchuria shall remain in force.

ARTICLE IX The present Treaty shall take effect on the day of its signature.

DECLARATION CONCERNING THE NON-ALIENATION OF THE PROVINCE OF FUKIEN

The Tsung-Li Yamên to the Japanese Minister

Peking, April 26, 1898.

Prince Ch'ing and the Ministers of the Tsung-li Yamên have the honour to reply to a communication from the Minister of Japan dated 2nd day, 3rd intercalary month, 24th year Kuang-Hsü (April 22, 1898), which reads as follows:

"A telegram has just been received from the Minister of Foreign Affairs, which reads as follows:

"'The Government of Japan has viewed with constant deep concern the difficulties which the Government of China has recently been confronted. The declaration made at the time of the evacuation of Weihaiwei is evidence of this. It is to be apprehended that trouble may arise with consequences disastrous to China. In all this there is no mistaking what our real purpose is.

"'In view of the present state of affairs, the Government of Japan, mindful of its own interests, cannot act as if entirely in ignorance of passing events, but must take proper measures to meet any situation that may arise. You will ask the Government of China to make a declaration that it will not cede or lease to any other Power any portion of its territory within the Province of Fu-kien.'"

Referring to his oral statements made in a personal interview, the Minister of Japan requests that a reply be given to his communication.

The Princes and the Ministers have

SINO-JAPANESE UNDERSTANDING ENTERED INTO IN 1905

Made Public, January 14, 1932

In 1905, when the Treaty concerning Manchuria and the supplementary agreement to it were concluded, the Japanese Government insisted on the insertion in the text of the Treaty definite engagements on certain matters. Since, however, the Chinese Government found it difficult for internal political reasons to consent to the publication of such engagements, it was agreed that these should be merely recorded in the Minutes of the Conference, which were drawn up both in Japanese and Chinese and signed by the Japanese and Chinese Plenipotentiaries. These unpublished understandings totalled sixteen in number. An English version summarising these provisions was submitted, in February, 1906, to the British and the United States Governments in strict confidence by the Japanese Government.

Inasmuch as there seems to be some doubt as to the existence of these understandings in the Minutes of the Conference, and as people even in positions of influence in China have openly denied it, the Government think the present a fit occasion to publish the above-mentioned communication made to the Governments of Great Britain and the United States.

Whereas the protocols of the Conference recently held between the Plenipotentiaries of Japan and China with regard to Manchuria are to be kept strictly secret in deference to the desire of the Chinese Government, only such portions of those Protocols as

Digitized by Google

possess the character of executory agreements are given in the following summary :

1. The railway between Changchun and Kirin will be constructed by China with capital to be raised by herself. She, however, agrees to borrow from Japan the insufficient amount of capital, which amount being about one-half of the total sum required. The contract concerning the loan shall, in due time, be concluded, following, mutatis mutandis, the loan contract entered into between the board of the Imperial Railways of North China and the Anglo-Chinese Syndicate. The term of the loan shall be twenty-five years, redeemable in yearly instalments.

2. The military railway constructed by Japan between Mukden and Hsinmintun shall be sold to China at a price to be fairly determined in consultation by Commissioners appointed for the purpose by the two Governments. China engages to reconstruct the line, making it her own railway, and to borrow from a Japanese corporation or corporations one half of the capital required for the portion of the line east of Liao-ho for a term of eighteen years repayable in yearly instalments, and a contract shall be concluded, for the purpose following, mutatis mutandis, the loan contract entered into between the Board of the Imperial Railways of North China and the Anglo-Chinese Syndicate.

All the other military railways in different localities shall be removed with the evacuation of the regions.

3. The Chinese Government engage, for the purpose of protecting the interest of the South Manchuria Railway, not to construct, prior to the recovery by them of the said railway, any main line in the neighbourhood of and parallel to that railway, or any branch line which might be prejudicial to the interest of the above-mentioned railway.

4. China declares that she will adopt sufficient measures for securing Russia's faithful observance of the Russo-Chinese treaties with regard to the railways which Russia continues to possess in the northern part of Manchuria, and that it is her intention, in case Russia acts in contravention of such treaty stipulations, to approach her strongly with a view to have such action fully rectified.

5. When in the future, negotiations are to be opened between Japan and Russia for regulation of the connecting railway services (Article VIII of the Treaty of Peace between Japan and Russia), Japan shall give China previous notice. China shall communicate to Russia her desire to take part in the negotiations through commissioners to be despatched by her on the occasion, and Russia consenting, shall participate in such negotiations.

6. With regard to the mines in the Province of Fengtien, appertaining to the railway, whether already worked or not, fair and detailed arrangements shall be agreed upon for mutual observance.

7. The affairs relating to the connecting services as well as those of common concern in respect of the telegraph lines in the Province of Fengtien and the cables between Port Arthur and Yentai shall be arranged from time to time as necessity may arise in consultation between the two countries.

8. The regulations respecting the places to be opened in Manchuria, shall be made by China herself, but the Japanese Minister at Peking must be previously consulted regarding the matter.

9. If no objection be offered on the part of Russia respecting the navigation of the Sungari (by Japanese vessels), China shall consent to such navigation after negotiations.

10. The Chinese Plenipotentiaries declare that immediately after the withdrawal of the Japanese and Russian troops from Manchuria, China will proceed to take, in virtue of her sovereign right, full administrative measures to guarantee peace in that region and endeavour, by the same right, to promote good and remove evil as well as steadily to restore order, so that the residents of that region, natives and foreigners, may equally enjoy the security of life and occupation under the perfect protection of the Chinese Government. As to the means of restoring order, the Chinese Government are to take by themselves all adequate measures.

11. While relations of intimate friendship subsisted as at the present time between China and Japan, Japan and Russia had unfortunately engaged

Digitized by Google

in war and fought in the territory of China. But peace has now been re-established and hostilities in Manchuria have ceased. And while it is undeniable that Japanese troops, before their withdrawal, have the power of exercising the rights occurring from military occupation, the Chinese Government declare that certain Japanese subjects in Manchuria have recently been observed to sometimes interfere with the local Chinese administration and to inflict damage to public and private property of China.

The Japanese Plenipotentiaries, considering that, should such interference and infliction of damage have been carried beyond military necessity, they are not proper acts, declare that they will communicate the purport of the above declaration of the Chinese Government to the Government of Japan, so that proper steps may be taken for controlling Japanese subjects in the Province of Fengtien and promote the friendly relations between the two nations, and also for preventing them in future, from interfering with the Chinese administration or inflicting damage to public or private property without military necessity.

12. In regard to any public or private property of China which may have been purposely destroyed or used by Japanese subjects without any military necessity, the Governments of the two countries shall respectively make investigations and cause fair reparation to be made.

13. When the Chinese local authorities intend to despatch troops for the purpose of subduing native bandits in the regions not yet completely evacuated by Japanese troops, they shall not fail to previously consult with the Commander of the Japanese troops stationed in those regions so that all misunderstandings may be avoided.

14. The Japanese Plenipotentiaries declare that the Railway Guards stationed between Changchun and the boundary line of the leased territory of Port Arthur and Talien, shall not be allowed, before their withdrawal, to unreasonably interfere with the local administration of China or to proceed without permission beyond the limits of the railway.

15. Chinese local authorities, who are to reside at Yingkou, shall be allowed, even before the withdrawal of the Japanese troops, to proceed to that place and transact their official business. The date of their departure is to be determined, as soon as possible after the definite conclusion of this Treaty, by the Japanese Minister to China in consultation with the Waiwupu. As there is still in that place a considerable number of Japanese troops, quarantine regulations as well as regulations for the prevention of contagious diseases, shall be established by the authorities of the two countries in consultation with each other so that epidemics may be avoided.

16. The revenue of the Maritime Customs at Yingkou shall be deposited with the Yokohama Specie Bank and delivered to the Chinese local authorities at the time of evacuation. As to the revenue of the native Customs at that place and the taxes and imposts at all other places, which are to be appropriated for local expenditures, a statement of receipts and expenditures shall be delivered to the Chinese local authorities at the time of evacuation.

DECLARATION ON THE ABOLITION OF EXTRATERRITORIALITY IN MANCHOUKUO, AUGUST 9, 1935

1. It was made clear in the Imperial Rescript issued in March, 1933, in connection with our decision to withdraw from the League of Nations, and also in the Japan-Manchoukuo Protocol signed on September 15, 1932, that Japan's policy toward Manchoukuo is based on the principle of enabling that country to make wholesome progress as an independent state, while maintaining an inseparable and interdependent relationship with this country, thus

Digitized by Google

advancing our national policy: to preserve the stability of Eastern Asia and to make known throughout the world our devotion to justice and righteousness.

Now, Manchoukuo has made steady and brilliant progress ever since its establishment. Internally, it has pursued constructive programmes along all lines—political, economic, administrative,—while externally it has striven to win the respect and confidence of the Powers. In the matter of extraterritoriality, Manchoukuo, following Japan's example, has been preparing for its abolition by setting up a judicial system and by effecting reforms in various departments, such as police and taxation. In fact, more than ¥8,000,000 is set aside in the budget of the Empire for the fiscal year 1934 for such purposes.

2. Japan has for many years enjoyed the privileges of extraterritoriality in Manchuria. Prior to the establishment of Manchoukuo, extraterritoriality was essential to the developmnt of Japanese interests there. But extraterritoriality is gradually losing its importance which diminishes with the progress of the above-mentioned Japan's policy toward Manchoukuo. Indeed, it is now necessary to abolish extraterritoriality in Manchoukuo if we are to afford that Empire free scope for development, establish a closer union and co-operation between our two peoples, make possible the general advancement of Japanese interests in all directions, and, finally, strengthen permanently the inseparable and friendly relations between the two countries. The South Manchuria Railway zone, acquired by us in consequence of a war with Russia on which we staked our national fortunes, has for the past thirty years been under our assiduous administration. It has served as the base of operations for Japanese activities in Manchuria. But it is now deemed necessary to adjust and transfer our administrative rights in that area for reasons involved in the abolition of extraterritoriality, in order to meet the new situation arising from the establishment of Manchoukuo.

3. For these reasons, at the Cabinet meeting of August 9th, the Japanese Government decided on the following general principles concerning the abolition of extraterritoriality and the adjustment and transfer of administrative rights in the South Manchuria Railway zone, according to which the authorities concerned will be instructed to devise concrete measures and to put these gradually into effect.

a. Concerning extraterritoriality in Manchoukuo, its abolition should be effected in keeping with the spirit of the treaties in force, in gradual stages, and to accord with the degree of completion of the governmental systems and organs of Manchoukuo, but especially with a view to avoid any sudden and violent changes in the life of Japanese communities in Manchoukuo, to insure more securely for Japanese throughout that Empire facilities for residence and safety and free development, and, in particular, to facilitate the smooth operation of Japan's policy toward the Empire.

b. The South Manchuria Railway zone will, of course, be retained by Japan as heretofore. But the administrative rights exercised by Japan in the zone will be adjusted and transferred, according to circumstances, keeping step with the gradual abolition of extraterritoriality, under similar considerations as above.

4. It should be added that Japan's rights in the leased territory of Kwantung are quite different from those in the South Manchuria Railway zone in their legal origin, their character, and various other respects. Thus it goes without saying that the adjustment and transfer of administrative rights in the South Manchuria Railway zone has no connection with Japan's rights in the Kwantung Leased Territory.

AGREEMENT CONCERNING THE TRANSFER OF THE NORTH MANCHURIA RAILWAY

Signed in Tokyo, March 23, 1935

ARTICLE I

The Government of the Union of Soviet Socialist Republics shall cede to the Government of Manchoukuo all the rights they possess concerning the North Manchuria Railway (Chinese Eastern Railway), in consideration of which the Government of Manchoukuo shall pay to the Government of the Union of Soviet Socialist Republics the sum of one hundred and forty million (140,000,000) yen in Japanese currency.

ARTICLE II

All the rights of the Government of the Union of Soviet Socialist Republics concerning the North Manchuria Railway (Chinese Eastern Railway) shall pass to the Government of Manchoukuo upon the coming into force of the present Agreement, and at the same time the North Manchuria Railway (Chinese Eastern Railway) shall be placed under the complete occupation and the sole management of the Government of Manchoukuo.

ARTICLE III

1 Upon the coming into force of the present Agreement, the senior members of the administration of the North Manchuria Railway (Chinese Eastern Railway) who are citizens of the Union of Soviet Socialist Republics shall be released from their duties. The said senior members of the administration of the Railway shall hand over all the archives, records, papers and documents of whatever description in their charge to their respective successors in the new administration of the Railway.

It is understood that the term the "senior members of the administration of the North Manchuria Railway (Chinese Eastern Railway)" employed in the present Article indicates :

(A) All the members of the Board of Directors and of the Audit Committee.

(B) The general manager and assistant manager of the Administration.

(C) The assistant chief controller.

(D) All the managers and submanagers of the Departments of the Board of Directors, the Audit Committee, the Control and the Administration. All agents for commission, engineers for commission. All the senior agents, advisers and chiefs of the sections and sub-sections.

2 With the aim of ensuring the normal functioning of the Railway, the Government of the Union of Soviet Socialist Republics agree to place at the disposal of the new administration the following persons from among the senior members of the administration of the Railway who are citizens of the Union of Soviet Socialist Republics as advisers for one month from the date of the coming into force of the present Agreement :

(A) The general manager of the Administration.

(B) The manager of General Affairs Office of the Administration.

(C) The manager of the Motive Power Department of the Administration.

(D) The chief of the Financial Department of the Administration.

(E) The manager of the Commercial Department of the Administration.

3 At any time after the coming into force of the present Agreement, the Government of Manchoukuo may dismiss any or all of the following persons :

(A) All the chiefs of railway sections, stations and depots.

(B) The chiefs of all the following auxiliary enterprises of the Railway :

a Forest concessions and lumbering.
b Coalmines.
c Power stations.
d Printing plant.
e Auxiliary enterprises of the Commercial Department.
f Nursery and green-houses in Harbin.

Digitized by Google

g Main workshops of the Ways Department.
h Wool-washing works and hydro-loading works.
i Water works in Harbin.
j Soft-drinks factory.
k Saw-mill.
l Gradations of beans.
m Waste-cleaning works.
n Grand Hotel.
o Health resorts and sanatoria.
p Hospitals and clinics.
q Library.
r Economic Bureau.

4 The persons referred to in Section 1 of the present Article shall have the right to remain in Manchoukuo and to retain their railway lodgings for one month after the coming into force of the present Agreement.

The persons referred to in Section 2 of the present Article shall have the right to remain in Manchoukuo and to retain their railway lodgings for two months after the coming into force of the present Agreement.

Those persons who have been dismissed by virtue of Section 3 of the present Article shall have the right to receive their regular salary for one month from the date of their dismissal. They shall have the right to remain in Manchoukuo and to retain their railway lodgings for two months from the date of their dismissal.

ARTICLE IV

The Government of Manchoukuo shall succeed to the assets and liabilities of the North Manchuria Railway (Chinese Eastern Railway) in accordance with the list of assets and liabilities of the Railway as on December 31st, 1933, presented by the Delegation of the Government of the Union of Soviet Socialist Republics on March 22nd, 1934, to the Delegation of the Government of Manchoukuo through the Minister for Foreign Affairs of Japan, as supplemented by the lists which were made on March 17th and March 21st, 1935, in order to show the changes sustained by the assets and liabilities included in the first list from the date of the first list up to the date of the last list and also to show the new assets and liabilities which have arisen on and after January 1st, 1934.

It is agreed that the provisions of Section 4, Article IX of the Agreement on General Principles for the Settlement of the Questions between the Union of Soviet Socialist Republics and the Republic of China signed at Peking on May 31st, 1924, and those of Section 3, Article I of the Agreement between the Government of the Union of Soviet Socialist Republics and the Government of the Autonomous Three Eastern Provinces of the Republic of China signed at Mukden on September 20th, 1924, shall remain in force.

ARTICLE V

The Government of the Union of Soviet Socialist Republics shall have the right to maintain the following property for the use of their Consulate General in Harbin in the form of a permanent and rent-free lease :

a The land and buildings now occupied by the said Consulate General :
Locality : Yio-Ching-Kai, Chin-Chia-Kang.
Area : 14,873.68 square metres.
Buildings :
Office, No. 1049 ; 2,174.90 square metres.
Residence, No. 1047 ; 685.37 square metres.
Residence, No. 1048 ; 1,447.61 square metres.
Garage and its annex, No. 1051 ; 245.88 square metres.
Guard-room, No. 1052 ; 38.90 square metres.

b The land and building now occupied by the officials of the said Consulate General :
Locality : Hai-Cheng-Kai, Chin-Chia-Kang.
Area : 2,530 square metres.
Building : No. 934 ; 258.51 square metres.

The following property shall be leased rent-free and sine die to the Consul General of the Union of Soviet Socialist Republics in Harbin on the day of the coming into force of the present Agreement, and shall immediately thereafter be placed and remain under the occupation and management of the community

Digitized by Google

of the citizens of the Union of Soviet Socialist Republics in Harbin to be used solely for the purposes prescribed hereunder:

a The IVth School of the North Manchuria Railway (Chinese Eastern Railway), situated at No. 35, Shang-Wu-Kai, Tao-Li, Harbin, with all the buildings and property to be found there, to be used for the elementary and secondary education of the said community.

b The land known under No. 949, at the corner of Kao-Shi-Kai and Ching-Cha-Kai, Tao-Li, Harbin, with all the buildings on it, which are to be used in the future as a hospital.

Within one month from the date of the coming into force of the present Agreement, a library shall be selected, for the use of the above-mentioned IVth School, from the books of the North Manchuria Railway (Chinese Eastern Railway) Library in Harbin, by mutual agreement between the local authorities of Manchoukuo and the Consul General of the Union of Soviet Socialist Republics in Harbin. The books so selected shall be transferred to the said School.

ARTICLE VI

The properties occupied by the North Manchuria Railway (Chinese Eastern Railway) which are claimed by the Government of the Union of Soviet Socialist Republics as belonging to them and not to the Railway, and the properties existing in the territory of the Union of Soviet Socialist Republics which are claimed by the Government of Manchoukuo as belonging to the North Manchuria Railway (Chinese Eastern Railway), are regarded as having been mutually renounced by respective Governments in favour of the other Government, and neither Government shall in future raise against the other Government any demand concerning the said properties.

The above provisions shall not apply to the properties (buildings and their sites and other railway properties) of the Transbaikal Railway now existing at Manchuli, and the properties of the Ussuri Railway now existing at Suifenho, which are actually occupied respectively by the said two Railways and shall remain their property under their management.

ARTICLE VII

Out of the sum of one hundred and forty million (140,000,000) yen in Japanese currency referred to in Article I of the present Agreement, the sum of forty-six million seven hundred thousand (46,700,000) yen shall be paid in cash in accordance with the provisions of Article VIII of the present Agreement, and the settlement for the remaining sum of ninety-three million three hundred thousand (93,300,000) yen shall be effected in the form of payments made by the Government of Manchoukuo for goods delivered to the Government of the Union of Soviet Socialist Republics in accordance with the provisions of Article IX of the present Agreement.

ARTICLE VIII

Out of the sum of forty-six million seven hundred thousand (46,700,000) yen to be paid in cash in accordance with the provisions of Article VII of the present Agreement, the sum of twenty-three million three hundred thousand (23,300,000) yen shall be paid simultaneously with the signing of the present Agreement.

The remaining sum of twenty-three million four hundred thousand (23,400,000) yen as well as the simple interest at the rate of three per cent. per annum is to be paid by the Government of Manchoukuo to the Government of the Union of Soviet Socialist Republics in the form of the Treasury Bonds of the Government of Manchoukuo. The said Treasury Bonds are to be issued of the following amounts and mature on the dates indicated hereunder: six million three hundred and seventy-six thousand five hundred (6,376,500) yen maturing on December 23rd, 1935; six million two hundred and forty-four thousand eight hundred and seventy-five (6,244,875) yen maturing on September 23rd, 1936; six million one hundred and thirteen thousand two hundred and fifty (6,113,250) yen maturing on June 23rd, 1937; five million nine hundred and eighty-one thousand six hundred and twenty-five (5,981,625) yen maturing on March 23rd,

Digitized by Google

1938. The Treasury Bonds of the Government of Manchoukuo mentioned above are to be issued in favour of the Government of the Union of Soviet Socialist Republics and are to be delivered by the Representative of the Government of Manchoukuo to the Representative of the Government of the Union of Soviet Socialist Republics simultaneously with the signing of the present Agreement, and shall be paid at the Industrial Bank of Japan, Ltd.

In case the exchange rate of the yen in terms of the Swiss franc calculated on the basis of the respective exchange rates of the yen and the Swiss franc in London on the day before the date of payment of any of the second and subsequent instalments provided for in the present Article should be lower or higher by eight per cent. or more in comparison with the exchange rate of the yen in terms of the Swiss franc as calculated on the basis of the respective exchange rates of the yen and the Swiss franc in London on the date of the coming into force of the present Agreement, the amount of the said instalment shall be increased or decreased, as the case may be, so that the value in Swiss francs of the instalment shall be the same as it is on the date of the coming into force of the present Agreement.

In case the present gold parity of the Swiss franc (one Swiss franc being equivalent to nine thirty-firsts of one gramme of fine gold) should be altered or in case the convertibility of the Swiss franc into gold should be suspended, the following method shall be adopted in place of the method provided for in the preceding paragraph.

In case the weight of fine gold whose value, when calculated on the basis of the price of gold and the exchange rate of the yen in London on the day before the date of payment of any of the second and subsequent instalments provided for in the present Article, is equal to the amount of the instalment, should be less or more by eight per cent. or more in comparison with the weight of fine gold whose value, when calculated on the basis of the price of gold and the exchange rate of the yen in London on the date of the coming into force of the present Agreement, is equal to the said instalment, the amount of the instalment shall be increased or reduced, as the case may be, so that the value in fine gold of the instalment shall be the same as it is on the date of the coming into force of the present Agreement.

ARTICLE IX

The settlement for the sum of ninety-three million three hundred thousand (93,300,000) yen, to be effected in the form of payments made by the Government of Manchoukuo for the goods delivered to the Government of the Union of Soviet Socialist Republics, as provided for in Article VII of the present Agreement, shall be executed in the following manner :

1 The Trade Representation of the Union of Soviet Socialist Republics in Japan will make contracts for the purchase of goods produced or manufactured in Manchoukuo or Japan, with the subjects or juridical persons of either of these two countries, up to the sum of ninety-three million three hundred thousand (93,300,000) yen indicated in Article VII within the period of six months from the date of the coming into force of the present Agreement. The delivery of the goods thus purchased shall be effected to the Trade Representation in Japan by the above-mentioned subjects or juridical persons within the period of three years from the date of the coming into force of the present Agreement in accordance with the terms of the contracts concerned, it being understood that the goods so delivered in the course of each of the six equal periods of six months constituting the said three years shall not exceed in value the sum of thirty-one million one hundred thousand (31,100,000) yen and that the total amount of the goods delivered in the course of each of the three equal periods of one year constituting the said three years shall not exceed in value the sum of thirty-one million one hundred thousand (31,100,000) yen.

2 The terms of payment for the goods shall be arranged in such a way that for each such period of six months in the course of the said three years the Government of Manchoukuo shall make payment not exceeding the sum of

Digitized by Google

fifteen million five hundred and fifty thousand (15,550,000) yen for the delivery of the goods mentioned in the foregoing Section and in case any balance of that sum shall for any reason remain unpaid at the end of any such period of six months, such balance shall be paid off during the next six months and so on, so that the whole sum of ninety-three million three hundred thousand (93,300,000) yen shall be paid off by the end of the said three years.

3 It is agreed that should the above-mentioned contracts not be concluded within the period of six months after the coming into force of the present Agreement, the Trade Representation shall have the right to make such contracts after the expiration of the said period of six months, and further that, should any of the parties other than the Trade Representation to the contracts concluded in accordance with the forgoing provisions of the present Article fail to carry out such contracts or to fulfil such contracts in a proper manner for which reason these contracts are abrogated, the Trade Representation shall in each case have the right to conclude fresh contracts with other subjects or juridical persons of Manchoukuo or Japan, in which case the latter contracts may provide for the payment for and the delivery of the goods to be effected after the three years' term above mentioned.

4 The contracts in the present Article shall be concluded either c.i.f. or f.o.b. at the choice of the Trade Representation and shall provide for payments in cash for goods by the Government of Manchoukuo.

5 When the Trade Representation have concluded a contract for the purchase of goods with the subjects or juridical persons of Manchoukuo or Japan, the Trade Representation shall give the Financial Attaché to the Legation of Manchoukuo in Japan a résumé of the contract, mentioning the names of the parties to the contract, the description, place of origin and quantity of the goods, to be paid, the date and place of delivery of the goods and of the payment therefor, as well as any other terms of the payment and delivery, including any provisions for payment in advance. The said résumé shall be attested by both parties to the contract. Besides this, so far as circumstances permit, certificates of origin issued by any chamber of commerce and industry in Manchoukuo or Japan in respect of the goods, or by any other organization authorized to issue such certificates by the Government of either of these two countries, shall be presented to the Financial Attaché by the seller of the goods.

The Financial Attaché, upon receipt of the résumé of the contract, provided its contents do not conflict with the provisions of the present Article, shall notify, not later than within seven days thereafter, the Trade Representation and the seller of the goods concerned to the effect that the Government of Manchoukuo undertake to effect payment for the goods in conformity with the said résumé of the contract.

For the purpose of obtaining a settlement of his accounts the seller of the goods shall hand to the Trade Representation the document entitling the Trade Representation to dispose of the said goods (bill of lading, invoice etc.).

The Financial Attaché, upon receipt of the notification given by the Trade Representation to the effect that the delivery of the goods referred to in the résumé of the contract has been accomplished, shall issue a cheque to order drawn with the Industrial Bank of Japan, Ltd. as payer, the seller of the goods as payee and the price of the goods as its face amount, and shall deliver it to the seller on the date of payment, and, in case the presentation of the certificates of origin of the goods above referred to shall have been prevented at the time of presentation of the résumé of the contract, against such certificates. The seller of the goods shall give a receipt for the said cheque. Payment in advance to the seller of the goods may be effected in a similar manner by the Financial Attaché in conformity with the résumé of the contract against the advice of the Trade Representation to the effect that such payment shall be made.

6 It is understood that in the present Article the term "goods manufactured in Manchoukuo or Japan" indicates goods manufactured within either of the said

Digitized by Google

two countries from raw materials imported from any other countries as well as from raw materials produced in either and that the term "juridical persons of Manchoukuo or Japan" indicates the juridical persons which are or may be incorporated in accordance with the law of Manchoukuo or Japan respectively.

ARTICLE X

1 Three month's notice shall be given to each of the employees of the North Manchuria Railway (Chinese Eastern Railway), other than those included in the provisions of Article III of the present Agreement, who are citizens of the Union of Soviet Socialist Republics and whom the Government of Manchoukuo may desire to dismiss from reasons of convenience on the part of the Government of Manchoukuo after the coming into force of the present Agreement.

2 Employees of the North Manchuria Railway (Chinese Eastern Railway) who are citizens of the Union of Soviet Socialist Republics and who may be dismissed shall have the right to remain in Manchoukuo for two months after their dismissal in order to dispose of their personal affairs.

3 Employees of the North Manchuria Railway (Chinese Eastern Railway) who are citizens of the Union of Soviet Socialist Republics shall continue in the full enjoyment of their rights in movable and immovable property in accordance with the laws of Manchoukuo.

4 Employees of the North Manchuria Railway (Chinese Eastern Railway) who are citizens of the Union of Soviet Socialist Republics shall enjoy the full right to dispose of their property in accordance with the laws of Manchoukuo and to carry their property out of Manchoukuo either in its original form or in its money equivalent in any foreign currency.

5 Employees of the North Manchuria Railway (Chinese Eastern Railway), who are citizens of the Union of Soviet Socialist Republics and who have retired through dismissal or of their own accord and who leave for the territory of the Union of Soviet Socialist Republics within two months after their retirement, shall be granted the privilege of free transport over the North Manchuria Railway (Chinese Eastern Railway) for themselves, their families, and their personal and household effects either to the station of Manchuli or to the station of Suifenho, at their own option.

ARTICLE XI

1 The various descriptions of retiring allowances and payments—(discharge allowances and other sums due to employees in respect of service on the Railway, employees' savings in the Relief Savings Association and the payments additional thereto on the part of the Railway including interest, pensions and block grants in accordance with the regulations of the Relief Savings Association, as well as pensions and compensations for personal injuries according to the "Regulations of 1912 relating to the indemnification of persons who have met with accidents")—to employees of the North Manchuria Railway (Chinese Eastern Railway) who are citizens of the Union of Soviet Socialist Republics and who may be dismissed or may retire of their own accord after the coming into force of the present Agreement, so far as such allowances and payments are in respect of the period before the coming into force of the present Agreement, shall be individually reckoned and paid out in accordance with the regulations of the North Manchuria Railway (Chinese Eastern Railway) in force up to the date of the coming into force of the present Agreement, as modified by the provisions of the present Article.

Note. Discharge allowances for the period up to November 11th, 1930, are to be paid according to the rates existing up to November 11th, 1930.

2 Employees who are citizens of the Union of Soviet Socialist Republics and who are dismissed or retire of their own accord after the coming into force of the present Agreement shall be considered as employees who have been dismissed as the result of the abolition of offices, so far as concerns the calculation of the various descriptions of retiring allowances and payments.

3 Discharge allowances and other

Digitized by Google

payments relative to service concerning the Railway, and compensations for injuries sustained in such service, as well as savings and the prescribed interest thereon, shall be paid within a fortnight from the day of dismissal or retirement, provided that in respect of persons who shall be dismissed, half the amount of such savings shall be paid within two months from the date of the notice of such dismissal.

The block grants to persons who have been in the service of the Railway for less than ten years as well as payments additional to savings together with the prescribed interest thereon shall be paid in four equal instalments within two years from the date of dismissal or retirement. The first instalment shall be paid within a fortnight, and the second instalment at the end of a year after the date of dismissal or retirement, and the third and the fourth instalments shall be paid at the end respectively of six and twelve months after the payment of the second instalment. As regards the last three of these instalments, the Government of Manchoukuo shall issue bonds for the amounts due drawn up in the name of the respective persons and maturing on the dates prescribed above. These bonds shall be delivered to the respective recipients simultaneously with the payment of the first instalment above referred to and shall not be transferred thereafter to any other person.

Persons who have been in the service of the Railway for ten years or more shall be deemed entitled to pensions without undergoing the examination of their working efficiency, and the said pensions, instead of being paid annually, shall be paid in a block grant, that is to say, a sum eight and a half times the sum payable annually in respect of a pension shall be paid to the recipient in four equal instalments in the course of two years, in accordance with the provisions of the preceding paragraph.

Note. 1 The examination of the working efficiency of employees who have been in the service of the Railway for less than ten years will be effected according to the regulations of the North Manchuria Railway (Chinese Eastern Railway) in force up to the date of the coming into force of the present Agreement.

Note. 2 Pensions for personal injuries, instead of being paid annually, shall be paid in block grants, that is to say, a sum eight and a half times the sum payable annually shall be paid to the recipients in the same manner as for persons who have been in the service of the Railway for ten years or more.

4 Employees of the North Manchuria Railway (Chinese Eastern Railway) who are in debt to the Railway shall have the sum of their indebtedness deducted from the various descriptions of retiring allowances and other payments due to them.

5 The various descriptions of retiring allowances and payments shall be paid in the currency of Manchoukuo at the exchange rate against the rouble of the North Manchuria Railway (Chinese Eastern Railway) existing at the date of the coming into force of the present Agreement and applied by the said Railway for settlements with their employees. The recipients of these retiring allowances and payments shall be allowed to remit the money they have received to other countries after having converted it into foreign currency.

6 The various descriptions of retiring allowances and payments and the bonds of the Government of Manchoukuo shall be paid or delivered to the legal recipients direct, but persons who have returned to the territory of the Union of Soviet Socialist Republics can empower the Consul General of the Union of Soviet Socialist Republics in Harbin or any other person to receive them. Persons who have given such authority shall at the same time inform the North Manchuria Railway (Chinese Eastern Railway) to that effect.

7 Those persons who have retired before the coming into force of the present Agreement and are now being paid pensions shall continue to receive the pensions as previously in accordance with the regulations of the North Manchuria Railway (Chinese Eastern Railway) in force up to the date of the coming into force of the present Agreement, irrespective of whether the said regulations shall remain in force, be

Digitized by Google

modified or abrogated thereafter. In this case Section 5 of the present Article shall be applied as regards the exchange rate against the rouble of the North Manchuria Railway (Chinese Eastern Railway), and, in case the legal recipients should be returning or should have returned to the territory of the Union of Soviet Socialist Republics, as regards remittances to other countries.

8 The sums which are to be paid out by the Administration or the Relief Savings Association of the North Manchuria Railway (Chinese Eastern Railway) to employees who are citizens of the Union of Soviet Socialist Republics and of which neither the legal recipients nor their proxies or successors have demanded payment up to the date of the coming into force of the present Agreement, shall be disposed of in accordance with the regulations of the North Manchuria Railway (Chinese Eastern Railway) in force up to the date of the coming into force of the present Agreement.

9 Employees who have been dismissed or have retired after the coming into force of the present Agreement shall, during a period of one month from the date of their dismissal or retirement, retain their full rights with regard to their railway lodgings under the same conditions as before.

ARTICLE XII

It is understood that the term "North Manchuria Railway (Chinese Eastern Railway)" includes all the rights, enterprises and properties appurtenant thereto.

ARTICLE XIII

The Governments of Manchoukuo and the Union of Soviet Socialist Republics, with a view to promote and facilitate the intercourse and traffic between the two countries, shall conclude, within three months from the date of the coming into force of the present Agreement, a separate agreement, which will provide for the settlement of questions concerning the conveyance of passengers, luggage and goods in transit, direct service for passengers, luggage and goods between railway stations of the Union of Soviet Socialist Republics and those of the North Manchuria Railway (Chinese Eastern Railway), and also, technical conditions permitting, direct services without reloading of goods between the Ussuri Railway and the North Manchuria Railway (Chinese Eastern Railway) via the station of Suifenho.

Within the period of the said three months, the two Governments shall conclude another separate agreement which will provide for telegraphic connection between the telegraphic lines hitherto operated by the North Manchuria Railway (Chinese Eastern Railway) and those of the Union of Soviet Socialist Republics.

ARTICLE XIV

The present Agreement shall come into force on the date of its signature.

NOTE GIVEN BY KOKI HIROTA, JAPANESE FOREIGN MINISTER, TO CONSTANTIN YOURENEFF, THE RUSSIAN AMBASSADOR TO JAPAN

Tokyo, March 23, 10 Showa (1935)

Monsieur l'Ambassadeur,

As the result of the guarantee given this day by the Japanese Government to the Government of the Union of Soviet Socialist Republics regarding the fulfilment by the Government of Manchoukuo of all the obligations of payment which the latter are under in favour of the Government of the Union of Soviet Socialist Republics in accordance with the provisions of the Agreement for the Cession to Manchoukuo of the Rights of the Union of Soviet Socialist Republics concerning the North Manchuria Railway (Chinese Eastern Railway),

Digitized by Google

signed this day by the Plenipotentiaries of the Union of Soviet Socialist Republics and Manchoukuo, I have the honour to inform Your Excellency as follows :

In case any difficulties should arise in connection with the execution of payments on the part of the Government of Manchoukuo, the Japanese Government will make every effort necessary under the given circumstances in order that the Government of the Union of Soviet Socialist Republics may receive all the payments due to them from the Government of Manchoukuo wholly and within the respective limits of time prescribed by the said Agreement, so that the Government of the Union of Soviet Socialist Republics may suffer absolutely no loss in connection with the said difficulties.

I avail myself, etc.

Koki Hirota

His Excellency Monsieur Constantin Youreneff.

CUSTOMS TARIFF LAW AMENDED AND REVISED TO JUNE, 1933

Article I Customs duties shall be levied upon articles imported from foreign countries in accordance with the annexed Tariff.

Article II Duties upon articles charged with ad valorem duty shall be levied on the value on arrival at the time of importation.

Article III With regard to articles, the produce or manufacture of territories not enjoying the benefit of a conventional arrangement, a benefit not exceeding the limits stipulated in such arrangement may, if necessary, be extended to such articles by means of Imperial Ordinance, specifying the territory and articles concerned.

Article IV With regard to the produce or manufactures or exports of, or articles passing through a country where Japanese vessels, produce or manufactures, or articles passing through Japanese territory are subject to a less favourable treatment than the vessels, produce or manufactures of, or articles passing through other countries, such articles may be designated by Imperial Ordinance so that special duties, not exceeding in amount their value, may be imposed upon them, in addition to the duties enumerated in the annexed Tariff.

Article V With regard to articles benefitting from export bounties in foreign countries, duties corresponding in amount to such bounties may be levied on them by Imperial Ordinance, in addition to the duties enumerated in the annexed Tariff.

Article V-2 When any important industry in this country is in danger of being injuriously affected by the importation of articles for the purpose of dumping or by the dumping of imported articles, such articles may be designated in accordance with the provisions of Imperial Ordinance after investigation by the Dumping Investigation Committee, and on such articles may be imposed during a specified period of time duties not exceeding in amount their proper value, in addition to the duties enumerated in the annexed Tariff.

In case the articles designated according to the provisions of the foregoing paragraph have already been imported and are owned by or in the possession of a dumper or his agent, the additional duty mentioned in the said paragraph may be collected from such dumper or agent.

The additional duty stipulated in the preceding paragraph shall be collected in the same way as a national tax.

Article VI The import duty on rice, hulled or unhulled, may in case of a famine be reduced by Imperial Ordinance for a specified period to a rate not lower than forty sen per hundred kin.

Article VII The following articles shall be exempt from import duties :—

1 Articles for the use of the Imperial Household.

2 Articles belonging to a foreign ruler and his family and suite, visiting Japan.

Digitized by Google

3 Arms, ammunition, and explosives imported by the Army or the Navy.
4 Mineral oils for fuel imported by the Government.
4-b Mineral oils for direct use as fuel, with a specific gravity exceeding 0.904 at 15° C., provided such oils are imported under Government permission according to the provisions of an Ordinance.
5 Warships.
6 Articles for the personal use of foreign Ambassadors and Ministers and other envoys of similar standing accredited to Japan, and articles for the official use of foreign Embassies and Legations in Japan, with the exception of those belonging to countries which enforce restrictions upon the free entry of articles for the personal use of the Japanese Ambassador, Minister or such other envoy, or of articles for the official use of the Japanese Embassy or Legation. In the case of such countries a reciprocal arrangement shall be applied.
7 Articles for the personal use of the staff of the Embassies or Legations in Japan of countries where similar courtesy is extended to the staff of the Japanese Embassy or Legation, and articles for the official use of the Consulates in Japan of countries where similar courtesy is extended to the Japanese Consulates.
8 Decorations, medals and badges presented to persons resident in this country.
9 Records and other documents.
10 Articles that are imported for use as specimens or objects of reference in the schools, museums, commercial museums and other institutions maintained by the Government or a municipality, or in private schools designated by Ordinance, and for the importation of which permission of the Minister of Finance has been obtained.
11 Supplies contributed for the purpose of charity or relief, or articles contributed to orphan asylums, asylums for the old, charity hospitals and such other charity institutions and which are used for the direct purpose of charity.
11-b Articles of use for ceremony or worship contributed to a shrine, temple, church or chapel.
12 Articles of Government monopoly imported by the Government.
13 Samples of merchandise only fit for use as such.
14 Personal effects of travellers, and their professional tools and implements, which the Customs authorities consider proper in view of the personal status of such travellers.
15 Articles sent home by the Imperial military forces, warships, or official missions abroad.
16 Personal effects and household articles in transportation on account of the change of residence, provided such effects and articles have already been used.
17 Exported articles which are reimported within five years unaltered in character and form from what they were at the time of exportation, excepting alcohol, alcoholic liquors, sugar, and those articles which had been exempted from import duty or granted a rebate under the provisions of Article VIII or Article IX.
18 Receptacles specified by Ordinance for containing exports and which are reimported, excepting such as had been exempted from import duty under the provisions of Article VIII.
19 Fish, shell-fish, mollusca, sea animals, sea weeds and other aquatic products caught or gathered by vessels which set out from Japan, and manufactures thereof of a simple process, provided they are imported by such vessels or vessels attached thereto.
20 Articles for ship's use delivered to warships and mercantile vessels bound for foreign countries, except those mentioned in Article X.
21 Wreckage and fittings of shipwrecked Japanese vessels.
22 Articles exported on vessels clearing from Japan but which are brought back owing to the wreckage of such vessels, except those

Digitized by Google

articles which had been exempted from import duty or granted a rebate under the provisions of Article VIII or Article IX.

23 Animals for breeding and protective serum or vaccine against animal plague, imported by the State, Do, Fu, Ken or other public bodies, by industrial juridical persons designated by the Government, or by persons under permission of the Government.

Article VIII The following articles are exempted from import duty in case they are to be re-exportd within one year from the date of their importation, but the deposit of security corresponding to the amount of duty may be required at the time of importation :—

1 Articles designated by Ordinance and which are imported to have work done upon them.
2 Receptacles of imported articles, designated by Ordinance.
2-b Articles to be used as receptacles of export goods and designated by Ordinance.
3 Articles imported for repair.
4 Articles imported for the purpose of scientific research.
5 Articles imported for trial.
6 Samples imported for the purpose of procuring orders.
6-b Articles imported as samples of workmanship.
7 Articles for use in public performances imported by travelling public entertainers visiting Japan.
8 Articles imported for exhibiting at an exposition, competition or prize show, etc.

Article IX Import duties on materials to be used for manufacturing export articles designated by Ordinance, may be exempted or refunded, wholly or partly, according to the provisions of the Ordinance.

Import duties on materials to be used for manufacturing lead foil for packing tea, zinc sheet not exceeding 0.17 millimetre, or oil or oil-cake designated by Ordinance, may be exempted or refunded wholly or partly, according to the provisions of the Ordinance.

In case import duties are exempted according to the provisions of the foregoing two paragraphs, the deposit of security corresponding to the amount of duties may be required at the time of importation.

Any person who obtains or attempts to obtain by fraud or other illegal means the refundment mentioned in the first or second paragraph of this Article, shall be dealt with according to the provisions of Article LXXV of the Customs Law.

Article X Iron or steel materials, equipments, parts of equipments, engines or parts of engines, which are to be used for shipbuilding or repair, and which are designated by Ordinance, may be exempted from import duties according to the provisions of the Ordinance.

Article XI The importation of the articles mentioned below is prohibited:—

1 Opium and utensils for smoking opium, excepting those imported by the Government.
2 Counterfeit, altered or imitation coins, paper money, bank-notes and negotiable papers.
3 Books, pictures, carvings and other articles, liable to injure public security or morals.
4 Articles which infringe rights in patents, utility-models, designs and trade-marks, and copyrights.

IMPORT TARIFF OF THE PRINCIPAL COMMODITIES[1]

N. B. In the column of Conventional Tariff, F. denotes France, I. Italy and C. China. Where the duty number is marked *, it means that the articles in question are subject to the provisions of the Luxury Tariff Law.

The extra column for "Specific Duty etc.," is due to the fact that on June, 16, 1932, a law was passed providing that, with certain exceptions, "Specific duties .. .. shall for the time being be assessed at the rate of 135 per cent." The figures in this extra column are calculated on this basis.

1 The rates are variable by order of the Government subject to the Commerce Adjustment and Safeguarding Law, for which see p. 443.

Digitized by Google

Tariff rates were amended by Law No. 37, 1935 as follows: 1 Under the item "Artificial musk" in No. 220 two subdivisions were made as under: Musk xylol 100 kin ¥125.00 others Ad val. 35%; 2 Precious stones under No. 412 were also subdivided as under: Precious stones, Precious stones specifically shaped for use in machines or for engineering purposes Ad val. 5%, others Ad val. 10%; 3 Magnesium in No. 463 (2) was altered so as to be read "Magnesium and magnecium alloy"; 4 No. 620 was amended so as to be read: "Platinum, vanadium or catalyzers containing its chemical compound free of duty;" 5 No. 631 concerning vulcanized fibres was amended and is to be read as under:

Vulcanized fibres (rods, plates, sheets, tubes, etc.) 100 kin ¥26.00.

FIRST — IN AUTOMOBILE MANUFACTURING

IT is a responsibility as well as an honor to be the largest builder of automobiles not only in Japan but in the entire world. Research, engineering, manufacturing methods and values must be preeminent if an organization is to maintain its preeminent position.

PROBLEMS

Everyone will agree that the Problems of the Far East are of transcending importance.

It is impossible to evaluate the closely interwoven fabric of the Far East without an understanding of the important component parts.

To understand Japan, it is essential to keep in close touch, not only with current events—startling as they often are—but with an impartial and thoroughly interpretative background of those events—for the events themselves are often but the surface indication of deeper and more significant currents—and those currents are forceful and moving rapidly in these days.

If you wish to keep yourself reliably informed, subscribe to The Japan Advertiser, concededly the leading foreign language daily published in Japan.

The Japan Advertiser is the one and only medium which supplies this information, fully and impartially, and which gives the essential interpretative background.
